Soveretgn Power, or Sovereignty, is the power of making laws; for wherever that power refides, all others mult conform to it, and be directed by it, whatever appearance the outward form and adminiftration of the government may put on. For it is at any time in the option of the leginature to alter that form and adminiftration by a new edict or rule, and to put the execution of the laws into whatever hands it pleafes : and all the other powers of the ftate mutt obey the legiflative power in the execution of their feveral functions, or elfe the conftitution is at an end. In our conftitution the law afcribes to the king the at- Blacelf. tribute of fovereignty : but that is to be undertood in Commanio a qualified fenfe, i. e. as fupreme magitrate, not as fole legillator; as the legiflative power is vefted in the king, lords, and commons, not in any of the three eftates alone.

\section*{SOU. See Sol.}

SOUL, the principle of perception, memory, intelligence, and volition, in man; which, fince the earlieft era of philofophy, has furnifhed queitions of difficult inveftigation, and materials of keen and important con.. troverfy (fee Metaphysics, Part III. chap. ii. iii. ivo v.; and Resurrection, \(\mathrm{n}^{\circ} 42\)-48.) In the fourth volume of the Memoirs of the Literary and Philofophical Society of Manchefter, the reader will find a very valuable paper by Dr Farrier, proving, by evidence ap: parently complete, that every part of the brain has beer injured without affecting the act of thought. An abridgment of that memoir would weaken its reafoning; which, built on matters of fact and experience, appears to us to have flaken the modern theory of the Materialifts from its very foundation.

Soul of Brutes. See Brutes.
SOUND, in phyfics, is a term of which it would be prepotterous to offer any definition, as it may almoft be faid to exprefs a fimple idea: But when we conflder it as a sensation, and fill more whell we confider it as a perception, it may not be improper to give a de\{cription of it; becaufe this muft involve certain rela: tions of external things, and certain trains of events in the material world, which make it a proper object of philofophical difcuffion. Sound is that primary information which we get of external things by means of the fenfe of hearing. This, however, does not explain it: for were we in like manner to defcribe our fenfe of hearing, we fhould find ourfelver obliged to fay, that it is the faculty by which we perceive found. Languages

\section*{S O U [612] S O U}
sound, are not the invention of philofophers; and we nuit no: expect precifion, even in the fimpleft cafes. Our methods of expreffing the information given us by our different fenfes are not fimilar, as a philofopher, cautiounly contriving language, would make them. We have no word to exprefs the primary or generic object of our fenfe of feeing; for we believe, that even the vulyar confider light as the medium, but not the object. This is certainly the cale (how juftly we do not fay) with the philolopher. On the other hand, the words fmell, found, and perhaps tafte, are conceived by moft perfons as expreffing the immediate objects of the fenfes of fmelling, hearing, and tafting. Smell and found are haftily conceived as feparate exiftences, and as mediums of information and of intercourfe with the odoriferous and founding bodies; and it is only the very cautious philofopher who diftinguifles between the fmell which he feels and the perfume which fills the room. Thofe of the ancients, therefore, who tanght that founds were beings wafted through the air, and felt by our ears, fhould not, even at this day, be confidered as aukward obfervers of nature. It has required the long, patient, and fagacious confiderat on of the moft penetrating geniufes, from Zeno the foic to Sir Ifaac Newton, to difcover that what we call found, the immediate extermal object of the fenfe ot hearing, is nothing but a particular agitation of the parts of furrounding bodies, acting by mechanical impulfe on our organs; and that it is not any feparate being, nor even a fpecific quality inherent in any particular thing, by which it can affect the organ, as we furpofe with refpect to a perfume, but merely a mode of exiftence competent to every atom of matter. And thus the defcription which we propofed to give of found mult be a defcription of that fate of external contiguous natter which is the caule of found. It is not therefore prefatory to any theory or fet of doctrines on this fubject ; but, on the contrary, is the fum or refult of them all.

To difcover this fate of external body by which, without any farther intermedium of fubftance or of operation, it affects our fenfitive faculties, muft be confidered as a great flep in feience. It will fhow us at leaft one way by which mind and body may be connected It is fuppofed that we have attained this knowledge with refpect to found. Our fuccefs, therefore, is a very pleafing gratification to the philofophic mind. It is ftill more important in another view : it has encouraged us to make fimilar attempts in other cafes, and has fupplied us with a fact to which an ingenious mind can eafily fancy fomething analogous in many abftrufe operations of nature, and thus it enables us to give fonse fort of explanation of them. Accordingly this ufe has been moft liberally made of the mechanical theory of \{ound; and there is now fcarcely any phenomenon, cither of matter or mind, that has not been explained in a manner fomewhat fimilar. Bur we are forry to fay that thefe explanations have done no credit to philofophy. They are, for the moft part, ftron ly marked with that precipitate and felf-conceited impatience which has always characterifed the inveftigations conducted folely by ingenious fancy. The confequences of this procedure have been no lefs fatal to the progrefs of true knowledge in modern times than in the fchools of ancient Greece; and the ethereal philofophers of this age, like the followers of Ariftotle of old, have filled
ponderous volumes with nunlenfe and error. It is ftrange, however, that this fhould be the effect of a great and a fuccefsful ftep in philofophy: But the fault is in the philofophers, not in the fcience. Nothing can be more certain that the account which Newton has given of the propagation of a certain clafs of undula, tions in an elaltic fluid. But this procedure of nature cannot be feen with diftinctnefs and precifion by anym but well-informed mathematicians. They alone can reft with unfhaken confidence on the conclufions legritimately deduced from the Newtonian theorems; and even they can infure fuccefs only by treading with the moft fcrupulons caution the fteps of this patient philo. fopher. But few have done this; and we may ven. ture to fay, that not one in ten of thofe who employ the Newtonian doctrines of elaftic undulations for the explanation of other phenomena have taken the trouble, or indeed were able, to go throngh the fteps of the fur.damental propolition (Prin. II. 5 c, Sc.) But the general refults are fo plain, and admit of fuch impreffive illuftration, that they draw the affent of the moft carelefs reader; and all imagine that they underitand the explanation, and perceive the whole procedure of na. ture. Emboldened therefore by this fuccefsful ftep in philofophy, they, without hefitation, fancy fimilar intermediums in other cafes; and as air has been found to be a vehicle for found, they have fuppofed that fomething which they call ether, fomehow refembling air, is the vehicle of vifion. Others have proceeded farther, and have held that ether, or another fomething like air, is the vehicle of fenfation in general, from the organ to the brain: nay, we have got a great volume called A Theory of Man, where all our fenfations, emotions, affections, thonghts, and purpofes or volitions, are faid to be fo many vibrations of another fomething equally unfeen, gratuitous, and incompetent ; and, to crown all, this exalted doctrine, when logically profecuted, mutt terminate in the difcovery of thofe vibrations which pervade all others, and which conftitute what we have been accuftomed to venerate by the name Deity. Such muft be the termination of this philofophy; and a truly philofophical differtation on the att-ibutes of the Divine Being can be norbing elfe than an accurate defcription of thefe vibrations!

This is not a needlefs and declamatory rhapfody. If the explanation of found can be legitimately transferred to thofe other claffes of phenomena, thefe are certain refults; and if fo, all the difcoveries made by Newton are but the glimmerings of the morning, when compared with this meridian fplendor. But if, on the other hand, found logic forbids us to make this transference of explanation, we muft continue to believe, for a little while longer, that mind is fomething different from vio brating matter, and that no kind of ofcillations will confitute infinite wifdom.

It is of immenfe importance therefore to underfand thoroughly this doctrine of found, that we may fee clearly and precifely in what it confifts, what are the phenomena of found that are fully explained, what are the data and the affumptions on which the explanations proceed, and what is the precife mechanical faid in which it terminates. For this, or a fact perfectly fimilar, muft terminate every explanation which we derive from this by analogy, however perfect the analogy may be. This previous knowledge muft be completely poffefled by eve.

\section*{\(\mathrm{S} O \mathrm{U}\)}
and. ry perfon whe pretends to explain other phenomena in a fimilar manner. Then, and not till then, he is able to fay what claffes of phenomena will admit of the explanation : and, when all this is done, his explanation is ftill an bypothefis, till he is able to prove, from other indifputable fources, the exiftence and agency of the fame thing analogous to the elaftic fluid, from which all is borrowed.

Such confiderations would juilify us for confidering with great attention the nature of found. But a work like this will not give room for a full difcuffion; and we mult refer our readers to the writers who treat it more at large. Much curious information may be got from the pains-takint authors of the laft century; fuch as Lord Bacon; Kircher; Merfennus; Cafferius in his great work De Voce et Auditu; Perrault in his Dif. Sertation du liruit; Muffenbroek in his great Syftem of Natural Philofophy, in 3 vols 4 to ; and in his Effris de \(P b y f q u e\); and the writings of the celebrated phyfiologifts of the prefent age. We alfo refer to what has been faid by us in the article Acoustics.

At prefent therefore we mult content ourfelves with giving a fhort hiftory of the fpeculations of philofophers on this fubject, tracing out the Iteps by which we have arrived at the knowledge which we have of it. We apprehend this to be of great importance ; becaufe it flows us what kind of evidence we have for its truth, and the paths which we mult fhun if we wifh to proceed farther: and we truft that the progrefs which we have made will appear to be fo real, and the object to be attained fo alluring to a teuly philofophical mind, that men of genius will be incited to exert their utmolt efforts to pafs the prefent boundaries of our real progrefs.

In the infancy of philofophy, found was held to be a feparate exiftence, fomething which would be, although no hearing animal exifted. This was conceived as wafted through the air to our ergan of hearing, which it was fuppofed to affect in a manner refembling that in which our noftrils are affected when they give us the fenfation of fmell. It was one of the Platonic species, fitted for exciting the intellectual fpecies, which is the immediate object of the foul's contemplation.

Yet, even in thofe early years of fcience, there were fome, and, in particular, the celebrated founder of the ftoic fchool, who held that found, that is, the caufe of found, was only the particular motion of external grofs matter, propagated to the ear, and there producing that agitation of the organ by which the foul is immediately affected with the fenfation of found. Zeno, as quoted by Diogenes Laertins*, fays, "Hearing is produced by the air which intervenes between the thing founding and the ear. The air is agitated in a \{pherical form, and moves off in waves, and falls on the ear, in the fame manner as the water in a ciftern undulates in circles when a ftone has been thrown into it." The ancients were not remarkable for precifion, either of conception or argument in their difcuffions, and they were contented with a general and vague view of things. Some followed the Platonic notions, and many the opinion o. Zeno, but without any farther attempts to give a diftinct conception of the explanation, or to compare it with experiment.

But in later times, during the ardent refearches in the laft century into the phenomena of nature, this be.
came an interefting fubject of inquiry. The invention 8 und. of the air-pump gave the firt opportunity of deciding by experiment whether the elaltic undulations of air were the caufes of tound: and the trial fully eftablifhed this point ; for a bell rung in vacuo gave no found, and one rung in condenfed air gave a very loud one. It was therefore received as a doctrine in general phyfics that air was the vehicle of found.
'i'he celebrated Galileo, the parent of mathematical phiolophy, difcovered the nature of that connection between the lengths of mufical cords and the notes which they produced, which had been obferved by Pithagoras, or learned by him in his travels in the eatt, and which he made the foundation of a refined and beautiful fcience, the theory of mufic. Galileo Chowed, that the real connection fublifted between the tones and the vibrations of thele cords, and that their different degrees of acutenefs correfponded to the different frequency of their vibrations The very elementary and familiar demonftration which he gave of this connection did not fatisfy the curious mathematicians of that inquifitive age, and the mechanical theory of mufical cords was profecuted to a preat degree of refinement. In the courfe of this inveftigation, it appeared that the cord vibrated in a manner precifely fimilar to a pendulum vibrating in a cycloid. It cult therefore agitate the air contiguous to it in the fame manner; and thus there is a particular kind of agitation which the air can receive and maintain, which is very interefting.

Sir Iface Newton toek up this queltion as worthy of his notice; and endeavoured to afcertain with mathematical precifion the mechanifm of this particular clafs of undulations, and gave us the fundamental theorems concerning the undulations of elaftic fluids, which make the \(4 \bar{\prime}\), \&c. propofitions of Book II. of his l'rinciples of Natural Philofophy. They have been (perhaps haftily) confidered as giving the fundamental doctrines cencerning the propagation of found. They are therefore given in this work in the article Acoustics; and a variety of facts are narrated in the article Pneumatics, to show that fuch undulations adually obtain in the air of our atmofphere, and are accompanied by a fet of phenomena of found which precifely tally or correfpond to all the mechanical circumftances of thefe undulations. In the mean time, the anatomifts and phy fiologifts were bufily employed in examining the ftructure of our organs of hearing. Impreffed with the validity of this doctrine of aerial undulations being the caufes of found, their refearches were always directed with a view to difcover thofe circumftances in the Itructure of the ear which rendered it an organ fufceptible of agitations from this caule ; and they difcovered many which appeared as contrivances for making it, a drum, on which the aerial undulations from without mult make very forcible impulfes, fo as to produce very fonorous undulations in the air contained in it. Thefe therefore they confidered as the immediate abjects of fenfation, or the immediate caulcs of found.

But fome anatomits faw that this would not be a full account of the matter : for after a drum is a jitated, it has done all that it can do; it has produced a noife. But a farther procefs goes on in our tar: here is behind the membrane, which \(1 s\) the head of this dum a curious mechanifm, which communicates the agitations.

\section*{S O U}
of the membrane (the only thing acted on by the undulating air) to another chamber of mot fingular conftruction, where the auditory nerve is greatly expanded. They conceive, therefore, that the organ called the drum does not act as a drum, but in fome other way. In deed it feems bad logic to fuppofe that it acts as a drum merely by producing a noife. This is in no refpeet different from the noife produced out of the ear; and if it is to be heard as a noife, we mult have another ear by which it may be heard, and this ear mult be another fuch drum; and this muft have another, and fo on for ever. 1 It is like the inaccurate notion that vifion is the contemplation of the picture on the retina. Thefe ana. tomifts attended therefore to the itructure. Here they oblèved a prodigious unfolding of the auditory nerve of the ear, which is curioully diftributed throngh every part of this cavity, lining its fides, hung acrofs it like a curtain, and fending off fibres in every direction, fo as to leave hardly a point of it unoccupied. They thought the machinery contained in the drum peculiarly fitted for producing undulations of the air contained in this labyrinth, and that by thefe agitations of the air the conti, \(r\) uous fibres of the auditory nerve are impelled, and that thus we get the fenfation of found.
- The cavity intervening between the external air and this inner chamber appeared to thefe anatomilts to have no other ufe than to allow a very free motion to the flapes or little pifton that is employed to agitate the air in the labyrinth. This pifton condenfes on a very fmall furface the impulfe which it receives from a much lar*er furface, ftrained by the malleus on the entry of the tympanum, on purpofe to receive the gentle agitations of the external air in the outer canal. 'This membranous furface could not be agitated, unlefs completely detached from every thing roind it ; therefore all animals which have this mechanifm have it in a cavity containing only air. But they held, that nature had even taken precautions to prevent this cavity from acting as a drum, by making it of fueh an irregular rambling form ; for it is by no means a cavity of a fymmetrical Thape, like a veffel, but rather refembles the rambling holes and blebs which are often feen in a piece of bread, feattered through the fubftance of the cranium, and communicating with each other by fmall paffages. The whole of thefe cavernulx are lined with a foftifh membrane, which fill farther unfits this cavity for producing found. This reafoning is fpecious, but'not very conclufive. We might even affert, that this anfractuous form, with narrow paffages, is well fitted for producing roife. If we place the ear clofe to the fmall hole in the fide of a military drum, we fhall hear the fmalleft tap of the drumftick like a violent blow. The lining of the cavernulx is nervous, and may therefore be ftrongly affected in the numerous narrow paffages between the cells.

While thefe fpeculations were going on with refpect to the ear of the breathing animals, obfervations were vecafionally made on other animals, fuch as reptiles, ferpents, and fifhes, which give undoubted indications of hearing; and many very familiar facts were obferved or recollected, where founds are communicated through or by means of folid bodies, or by water; therefore, without inquiring how or by what kind of mechanifm it is brought about, it became' a very general belief among phyfiologits, that all firhes, and perlaps all anie
mals hear, and that water in particular is a vehicle of found. In 1767 or 1768 the writer of this article, at the fuggeftion of the late profeffor of aftronomy in the univerfity of Glafgov, made an experiment in a lake in that neishbourhood, by ftriking a large hand-bell under water, and heard it very diftinctly and itrongly wheri his head was plunged in the water at the diftance of more than 1200 feet. Many experiments are mentioned by Kircher and others on the communication of found through folid bodies, fuch as mafts, yards, and other long beams of dry fir, with finilar refults. Dr Monro has publifhed a particular account of very curious experiments on the propagation of found through water in his Differtation on the Phyffology of Fifhes; fo that it now appears that air is by no means the only vchicle of found.
In 1760 Cotunni publifhed nis important difcovery, that the labyrinth or inmolt cavity of the ear in animals is completely filled with water. This, after fome conteft, has been completely demonitrated (fee in particular Meckel Junior de Labyrinthi Auris Contentis, Argentor, 1777), and it feems now to be admitted by
all.

This being the cafe, our notions of the immediate caule of found muft undergo a great revolution, and a new refearch muft be made into the way in which the nerve is affected: for it is not enough that we fubflitute the undulations of water for thofe of air in the labyrinth. The well informed mechanician will fee at once, that the vivacity of the agitations of the nerve will be greatly increafed by this fubtitution; for if water be perfectly elaftic through the whole extent of the undulatory agitation which it receives, its effect will be greater in proportion to its fpecific gravity: and this is confirmed by an experiment very eafily made. Immerfe a table-bell in water contained in a large thin glafs veffel. Strike it with a hammer. The found will be heard as if the bell had been immediately ftruck on the fides of the veffel. The filling of the labyrinth of the ear with water is therefore an additional mark of the wifdom of the Great Artift. But this is not enough for informing us concerning the ultimate mechanical event in the procefs of hearing. The manner in which the nerve is expofed to thefe undulations mult be totally diffcrent from what was formerly imagined. The filaments and membranes, which have been defcribed by former anatomilts, muft have been found by them in a ftate quite unlike to their fituation and condition in the living animal. Accordingly the moft eminent anatomifts of Europe feem at prefent in great uncertainty as to the fate of the nerve, and are keenly occupied in obfervations to this purpofe. The deferiptions given by Monro, Scarpa, Camper, Comparetti, and others, are full of moft curious difcoveries, which make almoft a total change in our notions of this fubject, and will, we hope, be productive of mof valuable information.
Scarpa has difcovered that the folid cavity called the labyrinth contains a threefold expanfion of the auditory nerve. One part of it, the cochlea, contains it in a fibrillous itate, ramified in a molt fymmetrical manmer through the whole of the zona mollis of the lamina \(\int p i-\) ralis, where it anaftomofes with another production of it diffufed over the general lining of that cavity. Allother department of the nerve; alfo in a fibrous flate, is fpread over the external furface of a membranaceons

\section*{5 O}
\(\left[\begin{array}{lll}615\end{array}\right] \quad \mathrm{S} O \quad \mathrm{U}\)
und. bag, which nearly fills that part of the veftibule inte which the femicircular canals open, and alfo that orifice which receives the impreffions of the ftapes. 'lhis bag fends off tubular membranaceous ducts, which, in like manner, nearly fill thefe Cemicircular canals. A third department of the nerve is fpread over the external furface of another membranaceous bag, which lies between the one juft now mentioned and the cochlea, but hawing no communication with either, almof completely flling the remainder of the veftibule. Thus the veftibule and canals feem only a cafe for protecting this fenfitive membranaceous veffel, which is almoft, but not altorether, in contact with the offeous cafe, being feparated by a delicate and almoft fuid cellular fubftance. The fibrillous expanfion of the nerve is not indifcriminately diffufed over the furface of thefe facculi, but evidently directed to certain foci, where the fibres are conftipated. And this is the laft appearance of the fibrous ftate of the nerve; for when the infide of thefe facculi is infpected, no fibres appear, but a pulp (judged to be nervous from its fimilarity to other pulpy productions of the brain) adhering to the membranaceous coat, and not feparable from it by gently wafhing it. It is more abundant, that is, of greater thicknefs, oppofite to the ex. ternal fibrous foci. No organical ftructure could be difcovered in this pulp, but it probably is organifed; for, befides this adhering pulp, the water in the facculi was obferved to be clamny or mucous; fo that in all probability the vafcular or fibrous fate of the nerve is fucceeded by an uninterrupted production (perhaps columnar like bafalt, though not cohering); and this at latt ends in fimple diffemination, fymmetrical however, where water and nerve are alternate in every direction.

To thefe ohfervations of Scarpa, Comparetti adds the curious circumitances of another and regular tympanum in the foramen rotundum, the cylindric cavity of which is inclofed at both ends by a fine membrane. The membrane which feparates it from the cochlea appears to be in a fate of variable tenfion, being drawn up to an umbo by a cartilaginous fpeck in its middle, which he thinks atheres to the lamina fpiralis, and thus ferves to ftrain the drumhead, as the malleus ftrains the great membrane known to all.

Thefe are moft important obfervations, and muft greatly excite the curiofity of a truly philofophical mind, and deferve the moft careful inquiry into their juthefs. If thefe are accurate defcriptions of the orgrair, they feem to conduct us farther into the fecrets of nature than any thing yet known.

We think that they promife to give us the greateft flep yet made in phyfiology, viz. to fhow us the laft mechanical fact which occurs in the long train interpofed between the external body and the inciteinent of vur fenfitive fyftem. But there is, as yet, great and effential differences in the defeription given by thofe celebrated naturalifts. It cannot be otherwife. The containing labyrinth can be laid open to our view in no other way than by deftroying it; and its moft delieate contents are the firft fufferers in the fearch. They: are found in very different fituations and conditions by different anatomifs, according to their addrefs or their good fortune. Add to this, that the natural varieties are very confiderable. Faithful defcriptions muft therefore give very different notions of the ultimate action
and reaction between the unorganifed matter in the law somat: byrinth and the ultimate expanfion of the auditory nerve.

We mult therefore wait with patience. Since this Work of ours was begun, the progrefs which has been made in many parts of natural fcience has been' great and wonderful; and perhaps before it be completed, we may be furnifhed with fuch a collection of facts re: fpecting the fructure and the contents of the organ of hearing, as might enable us to give a jufter theory of found than is yet to be found in the writings of philo\{ophers. There feems to be no abatement of ardour in the refearches of the plyyfiologifts; and they will not remain long ignorant of the truth or miftake in the accounts given by Scarpa and Comparetti. Should the refult of their inquiries be what we expeet, we fhould be glad of a proper opportunity of laying it before our readers, together with fome difquifition on the nature of hearing. A collection of accurate obfervations on the fructure of the ear would give us principles on which to proceed in explaining the various methods of produo cing external founds. The nature of continued found's might then be treated of, and would appear, we believe, very different from what it is commonly fuppofed. Under this head animal voices might be particularly confidered, and the elements of human fpeech properly afcertained. When the production of continued founds is once fhown to be a thing regulated by principle, it may be •yftematically treated, and this principle may be confidered as combined with every meclanical ftate of body that may be pointed out. This will luggeft to us methods of producing found which have not yet been thought of, and may therefore give us founds with which we are unacquainted. Such an acquilition is not to be defpiled nor rejected. The bountitul Author of our being and of all our faculties has made it an object of molt enchanting relifh to the human mind. The Greeks, the moft cultivated people who have ever figured on the fage of life, enjoyed the pleafures of wufic with rapture. Even the poor negro, after toiling a whole day beneath the tropical fun, will go ten miles in the dark to dance all night to the fimple mutic of the balafoe, and return. without fleep to his. next day's toil. The penettating eye of the anatomift has difcovered in the human larynx. an apparatus evidently cortrived for tempering the great movements of the glottis, fo as to enable us to produce the intended note with the utmoft precifion. There is no doubt therefore that the confummate Artift has not thought it unworthy of his attention. We ought therefore to receive with thankfulnefs this prefent from our Maker-this laborum dulce lenimen; and it is furely worthy the attention of the philofopher to add to this innocent elegance of life. This, however, is not the time to enter upon the fubject. From the jarring obfervations, which have yet been made, we could only amufe the curious reader by holding up to his view a fpecious theory; and we are not fo defirous of flling our Work with what is called original matter, as to attempt the attainment of that end by fubftituting fiction for fact and hypothefis for fcience.

Sound, in geography, denotes in general any ftrait or inlet of the fea between two headlands. It is given by way of eminence to the ftrait between Sweden and

Denmark

\section*{S O U \\ [ 616 ] \\ \(S O\) U}

Sounding. Denmark, joining the German ocean to the Baltic, being about three miles over. See Denmaris, \(n^{\circ} 3^{2}\). and Elsinore.
.SOUNDING, the operation of trying the depth of the fea, and the nature of the bottom, by means of a plummet funk from a fhip to the bottom.

There are two plummets ufed for this purpofe in uavigation ; one of which is called the band-lead, weighing about 8 or 9 pounds; and the other the deep fealead, which weighs from 25 to 30 pounds; and both are fhaped like the fruftum of a cone or pyramid. The former is ufed in fhallow waters, and the latter at a great diftance from the fhore; particularly on approaching the land after a fea-voyage. Accordingly the lines employed for this purpofe are called the deep-fea leadSine, and the hand lead-line.
The hand lead-line, which is ufually 20 fathoms in length, is marked at every two or three fathoms; fo that the depth of the water may be afcertained either in the day or night. At the depth of two and three fathoms, there are marks of black leather; at 5 fathoms, there is a white rag; at 7 , a red rag; at 10 , black leather; at 13, black leather; at 15, a white rag; and at 17 , a red ditto.

Sounding with the hand lead, which is called beaving the lead by feamen, is generally performed by a man who ftands in the main chains to windward. Having the line quite ready to run out without interruption, he holds it nearly at the diftance of a fathom from the plummet ; and having fwung the latter backwards and forwards three or four times, in order to acquire the greater velocity, he fwings it round his head, and thence as far forward as is neceffary; fo that, by the lead's finking whilft the fhip advances, the line may be almoft perpendicular when it reaches the bottom. The perfon founding then proclaims the depth of the water in a kind of fong refembling the cries of hawkers in a city. Thus if the mark of five fathoms is clofe to the furface of the water, he calls, 'By the mark five!' and as there is no mark at four, fix, eight, \&c. he eftimates thofe numbers, and calls, 'By the dip four,' 2 c . If he judges it to be a quarter or an half more than any particular number, he calls, 'A Ad a quarter five! and a half four,' \(\& c\). . If he conceives the depth to be three quarters more than a particular number, he calls it a quarter lefs than the next : thus, at four fathoms and three fourths he calls 'A quarter lefs five!' and fo on.

The deep fea-lead is marked writh two knots at 20 fathoms, three at 30 , four at 40 , and fo on to the end. It is alfo marked with a fingle knot in the middle of each interval, as at \(25,35,45\) fathoms, \&c. To ufe this lead more effectually at fea, or in deep water on the fea-coaft, it is ufual previoufly to bring to the finip, in order to retard her courfe : the lead is then thrown as far as poffible from the fhip on the line of her drift, fo that, as it finks, the fhip drives more perpendicularly over it. The pilot, feeling the lead ftrike the bottom, readily difcovers the depth of the water by the mark on the line nearelt its furface. The bottom of the lead being alfo well rubbed over with tallow, retains the dittinguifhins marks of the buttom, as fhells, ouze, gravel, \&c. which naturally adhere to it.

The depth of the water, and the nature of the ground, which is called the foundings, are carefully marked in the log-book, as well to determine the diftance of the place
from the fhore, as to correct the obfervations of former pilots.

SOUP, a ftrong decoction of flefh or other fubftances.

Portable or dry foup is a kind of cake formed by Cbaptal's boiling the gelatinous parts of animal fublances till the Cbemifiry watery parts are evaporated. This fpecies of foup is chiefly ufed at fea, and hat been found of great advantage. The following receipt will fhow how it is prepared.

Of calves feet take 4 ; leg of beef 12 lbs . ; knuckle of veal 3 lbs .; and leg of mutton 10 lbs . Thefe are to be boiled in a fufficient quantity of water, and the fcum taken off as ufual ; after which the foup is to be feparated from the meat by ftraining and preffure. The meat is then to be boiled a fecond time in other water ; and the two decoctions, being added together; mult be left to cool, in order that the fat may be exactly feparated. The foup muft then be clarified with five or fix whites of eggs, and a fufficient quantity of common falt added. The liquor is then ftrained through flannel, and evaporated on the water bath to the confiftence of a very thick pafte; after which it is fpread rather thin upon a fmooth ftone, then cut into cakes, and laftly dried in a ftove until it becomes brittle: thefe cakes are kept in well clofed bottles. The fame procefs may be ufed to make a portable foup of the flefi of poultry; and aromatic herbs may be ufed as a feafoning, if thourht proper.

Thefe tablets or cakes may be kept four or five years. When intended to be ufed, the quantity of half an ounce is put into a large glafs of boiling water, which is to be covered, and fet upon hot afties for a quarter of an hour, or until the whole is entirely dif. folved. It forms an excellent foup, and requires no addition but a finall quantity of falt.

SOUTH (Dr Robert), an eminent divine, was the fon of Mr William South a merchant of London, and was born at Hackney near that city in 1633 . He \#udied at Weftminfter fchool, and afterwards in Chriftchurch college, Oxford. In 1654, he wrote a copy of Latin verfes to congratulate Cromwell upon the peace concluded with the Dutch ; and the next year a Latin poem, intitled Mufica Incantans. In 1660 he was elect. ed public orator of the univerfity; and the next year became domeftic chaplain to Edward earl of Clarendon, lord-high chancellor of England. In 1663 he was in. falled prebendary of Weftminfter, adinitted to the degree of doctor of divinity, and had a finecure beftowed on him in Wales by his patron the earl of Clarendon; after whofe retirement into France in 1667 he became chaplain to the duke of York. In 1670 he was inftalled canon of Chrift-church in Oxford; and in 1676 attended as chaplain to Laurence Hyde, Efq; ambaffador extraordinary to the king of Poland. In 1678 he was prefented to the rectory of Mip in Oxfordhire ; and in 1680 rebuilt the chancel of that church, as he afterwards did the reetory-houfe belonesing to it. After the revolution he took the oath of allegiance to king William and queen Mary, though he excufed himfelt from accepting a great dignity in the church, vacated by the perfonal refufal of that oath. His health began to de-

\section*{S O U}
cline feveral years before his death, which happened in 171.6. He was interred in Weftminfter Abbey, where a monument is erected to his memory. He publifhed, 1. Animadverfions on Dr Sherlock's Vindication of the Holy and Ever Bleffed Trinity, 2. A Deferice of his Animad́verfions. 3. Sermons, 8 vols 8 vo. And after his deceafe were publifhed his Opera Poflhuma Latina, and his pofthumous Engliih works. Dr South was remarkable for his wit, which abounds in all his writings, and particularly in his fermons; but at the fame time they equally abound in ill-humour, fpleen, and fatire. He was remarkable for being a time-ferver. During the life of Cromwell he was a ftaunch Prefbyterian, and then railed againft the Independents : at the Reftoration he exerted his pulpit-eloquence againft the Prefbyterians; and in the reign of Queen Anne, was a warm advocate for Sachéverel.

South, one of the four cardinal points from which the winds blow.

South Sea, or Pacific Ocean, is that vaft body of water interpofed between Afia and America. It does not however, ftrictly fpeaking, reach quite to the continent of A fia, excepting to the northward of the peninfula of Malacca: for the water interpofed between the eaftern coaft of Africa and the peninfula juft mentioned has the name of the Indian Ocean. The South Sea then is bounded on one fide by the weftern coaft of America, through its whole extent, from the unknown regions in the north to the ftraits of Magellan and Terra del Fuego, where it communicates with the fouthern part of the Atlantic. On the other fide, it is bounded by the coaft of Afia, from the northern promontory of Tfchukotfkoi Nofs, to the peninfula of Malacca already mentioned. Thence it is bounded to the fouthward by the northern coafts of Borneo, Celebes, Macaffar, New Guinea, New Holland, and the other iflands in that quarter, which divide it from the Indian Ocean. Then, wafhing the eaftern coaft of the great ifland of New Holland, it communicates with that vaft body of water encompaffing the whole fouthern part of the globe, and which lias the general name of the Soutbern Ocean all round. Thus does this vaft ocean occupy almoft the femicircumference of the globe, extending almoft from one pole to the other, and about the equatotrial parts extending almoft \(180^{\circ}\) in longitude, or 12,500 of our miles.

The northern parts of the Pacific Ocean are entirely deftitute of land; not a fingle ifland having yet been difcovered in it from the latitude of \(40^{\circ}\) north and up. wards, excepting fuch as are very near the coalt either of Afia or America; but in the fouthern part there are a great number.

Till very lately the South Sea was in a great meafure unknown. From the great extent of ice which covers the fouthern part of the globe, it was imagined that much more land exifted there than in the northern regions : but that this could not be juftly inferred mereIy from that circumftance, is plain from what has been advanced under the article America, ne \(3-24\); and the fouthern continent, long known by the name of Terra Auftralis, has eluded the fearch of the mott ex. pert navigators fent out from Britain and France by toyal authority. See Terra Australis.

SOUTHAMPTON, a fea-port town of Hampfire Southamp-
in England. It is commodioufly feated on an arm of ton the fea; is a place of good trade, and well inhabited. It is furrounded by walls and feveral watch-towers, and

Sozomenus. had a ftrong caftle to defend the harbour, now in ruins. It is a corporation and a county of itfelf, with the title of an earldom, and fends two members to parliament. W. Long. 1. 26. N. Lat. 50.55 .

SOUTHERN (Thomas), an eminent dramatic writer, was born at Dublin in 1660, and received his edscation in the univerfity there. He came young to London to ftudy law; but inftead of that devoted himfelf to poetry and the writing of plays. His Perfian Prince, or Lioyal Brother, was introduced in 1682, when the Tory intereft was triumphant in England; and the character of the loyal brother being intended to compliment James duke of York, he rewarded the author when he came to the throne with a commifion in the army. On the Revolution taking place, he retired to his fludies, and wrote feveral plays, from which he is fuppofed to have derived a very handfome fubfiftence, being the firft who raifed the advantage of play-writing to a fecond and third night. The moft finifhed of all his plays is Oroonoko, or the Royal Slave, which is built on a true ftory related in one of Mrs Behn's novels. Mr Southern died in 1746 , in the 86 th year of his age; the latter part of which he fpent in a peaceful ferenity, having, by his commiffion as a foldier, and the profits of his dramatic works, acquired a handfome fortune; and being an exact economit, he improved what tortune he gained to the beft advantare. He enjoyed the longeft life of all our poets ; and died thę richeft of them, a very few excepted. His plays are printed in * two vols 12 mo .

SOZOMENUS (Hermias), an ecclefiaftical hiftorian of the \(5^{\text {th }}\) century, was born in Bethelia, a town of Paleftine. He was educated for the law, and became a pleader at Conftantinople. He wrote an A. bridgment of Ecclefiattical Hiftory, in two books, from the afcenfion of our Saviour to the year 323. This compendium is loft ; but a continuation of it in nine books, written at greater length, down to the year 440, is fill extant. He feems to have copied Socrates, who wrote a hiftory of the fame period. The ftyle of Sozomenus is perhaps more elegant ; but in other refpects he falls far fhort of that writer, difplaying throughout his whole book an amazing credulity and a fuperfitious attachment to monks and the monaftic life. The

\section*{S P A [ GY 18\(] \quad \mathrm{S} \mathrm{P} \mathrm{A}\)}

Spa. beft edition of Sozomenus is that of Robert Stephea in 1544. Ife has been tranfated and publifhed by Vale. firs, and republifhed with additional notes by Reading at London, 1720 , in 3 vols folio.
SPA, a town of Germany, in the circle of Weltphaiia and bifhopric of Liege, famous for its mineral warets, lies in E. Long. 5. 50. N. Lat. 50. 30. about 21 miles fouth-eaft from Liege, and 7 fouth-welt from Lemburg., It is fituated at one end of a deep valley on the banks of a fmall rivulet, and is furrounded on all fides by high mointains. The fides of thefe mountains next to Spa are rude and uncultivated, prefenting a rugced appearance as if fhattered by the convulfions of earthquakes ; but as they are ftrewed with tall oaks and abundahce of fhrubs, thic country around forms a wild, fomantic, and beantitul landfcape. The accefs to the town is very beantiful. The road winds over the mountains till it defcends to their bottom, when it runs along a fmooth valley for a mile or a mile and a half.
The town confifte of four flreets in form of a crols, and contains about 400 inhabitants. Spa has no wealth to boaft of. It can fcarcely furnih the neceffaries of life to its owh inhabitants during the winter, and almoft all the luxuries which are requifite for the great concourfe of affluent vifitors during the fummer are carried from Liege by women. Its only fource of wealth is its mineral waters. No fooner does the warm feafon commence, than crowds of valetudinarians arrive, as well as inany other perfons who are attracted folely by the love of amufement, and fome from lefs honourable motives. The inhabitants, who fpend feven or eight months of the year without feeing the face of a franger, wait for the return of this period with impatience. The welcome found of the carriages brings multitudes from the town, either to gratify their curiofity, or to offer their fervices in the hopes of fecuring your employment while you remain at Spa. Tinmediately after your arrival your name and defignation is added to the printed lift of the annual vifitors; for which you pay a flated fum to the bookfeller, who has a patent for this purpofe from the prince bifhop of Lieğe. This lift not only enables one to know at a glance whethèr any friends or aciquaintance are refiding there, but alfo to diftinguifh perfons of rank and fafhion from adventurers, who feldom have the effrontery to infert their names.

There are two different ways of accommodating the vifitors at Spa with lodging and neceffaries. People may either lodge at an hotel, where every thing is furpifhed them in a Iplendid and expenfive fyle; or they
may take up their refidence in private lodgings, from which they may fend for provifions to a cook's thop.

Among the people who vifit Spa, there are many perfons of the fifft rank and faghion in Europe. Perhaps indeed there is no place in Europe to whicly fo many king and princes refort ; but it is alfo vifited by many felf-created nobility, who, under the titles of counts, barons, marquifes, and knights, contrive by their addrefs and artifices, to prey upon the rich and unexperienced.
The manners eftablifhed at Spa are conducive both to health and amufement. Every body rifes early in the morning, at fix o'clock or before it, when a great many horfes ftand ready faddled for thofe who choofe to drink the Sauveniere or Geronftere waters at a little diftance from Spa. After this healthy exercife a part of the company generally breakfaft together at Vaushall, a magnaificent and fpacious building. At this place a number of card.tables are opened every forenoon, round which many perfons affemble and play for ftakes to a very confiderable amount. A ball too is generally held once a week at Vauxhall, befides two balls at the affembly rooms near the Ponhon in the middle of the town.
The moft remarkable waters at Spa are, 1. The Pouhon, fituated in the middle of the town ; 2. The Sazveniere, a mile and a half eaft from it; 3 . Groifbeck, near to the Sauveniere; 4. Tonnelet, fituated a little to the left of the road which leads to the Sauveniere; 5. Geroniftere, two miles fouth from Spa; 6. Wartroz, near to the Tonnelet; 7 . Sarts or Nivefet, in the diftrict of Sarts ; 8. Chevion or Bru, in the principality of Slavelot ; 9. Corve ; 10. Beverfe; 11. Sige; 12. Geremont. Thefe four laft are near Malmedy.

Dr Browirigg was the firft perfon who difcovered that fixed air, or, as it is now generally called, carbonic acid gas, forms a principal ingredient in the compofition of the Spa waters, and actually feparated a quantity of this elaftic fluid, by expofing it to different degrees of heat from \(110^{\circ}\) to \(170^{\circ}\) of Fahrenheit. From 20 ounces 7 drams and 14 grains apothecaries weight of the Pouhon water, he obtained 8 ounces 2 drams and 50 grains. Since June 1765 , when Dr Brownigigg read a paper on this fubject before the Royal Society of London, the waters of Spa have been often analy fed, but perhaps by none with more accuracy than by \(\operatorname{Dr} \mathrm{Afh}\), who publifhed a book on the chemical and medicinal properties of thefe waters in r 988 . We flall prefent his ana. lyfis of the five principal fprings in the following table,

\section*{S P A [ 619 ] S P A}

The Pouhon fpring rifes from the hill to the north of Spa, which confifts of argillaceous fchiftus and ferrugineous flate. The other fountains rife from the furrounding hills to the fouth-eaft, fouth, weft, and northweft of the town; and this ridge of mountains is formed of calcareous earths mixed with filiceous fubftances. The furface of the mountains is covered with woods, interfperfed with large boggy fwamps filled with mud and water. The Pouhon is confidcred as the principal fpring at Spa, being impregnated with a greater quantity of iron than any of the reft, and containing more fixed air than any cxcept the Tonnelet. It is from this fpring that the Spa water for exportation is bottled; for which the demand is fo great, that, according to the beft information which Mr Thickneffe could obtain, the quantity exported amounts to 200,000 or 250,000 bottles annually. This exported water is inferior in its virtue to that which is drunk on the fpot ; for the vef fels into which it is collected are injudicioufly expofed to the fun, rain, wind, and duft, for feveral hours before they are corked, by which means a confiderable part of its volatile ingredients muft be evaporated; for it has been found by experiment, that by expofing it to a genthe heat, air-bubbles afcend in great numbers. It is in its greateft perfection when collected in cold dry weather; it is then pellucid, colourlefs, and without fmell, and almoft as light as diftilled water. It varies in its heat from \(52^{\circ}\) or \(53^{\circ}\) to \(67^{\circ}\) of Fahrenheit's thermometer.

The Geronftere is a much weaker chalybeate water than the Pouhon ; and as it is exceedingly naufeous, and taftes and fmells like rotten eggs, it certainly contains fome hepatic gas. This is a circumftance which Dr Afh feems not to have attended to fufficiently. The Sauveniere water alfo, when newly taken from the well, fmells a little of fulphur. The Groifbeck contains more alkali, and almoft as much gas as the Pouhon, and has been celebrated for its good effecta in the cafe of calculous concretions. The Tonnelet contains more gas than any of the reft. So fmall is the quantity of any foffil body held in fufpenfion by the aerial acid in it, and fo volatile is the gas, that it begins to pafs off very rapidly the moment it is taken out of the well, and in a fhort time is entirely gone. Dr Afh informs us, that in the neighbourhood of this well, the cellars, on any approaching change of weather, are found to contain much fixed air ; and the beft prognoftic which they have of rain is the averfion which cats flow to be carried into theefe cellars.

The Spa waters are diuretic, and fometimes purgative. They exhilarate the foirits with an influence much more benign than wine or fpirituous liquors, and they are more cooling, and allay thirft more effectually than common water. They are found beneficial in cafes of weaknefs and relaxation, either partial or univerfal ; in nervous diforders; in obftructions of the liver and fpleen; in cales where the blood is too thin and putrefcent; in cafes of exceffive difcharges proceeding from weaknefs; in the gravel, and ftone; and in moft cafes where a ttrengthening remedy is wanted. But they are hurtful in confirmed obftructions attanded with fever, where there is no free outlet to the matter, as in nlcerations of the lungs. They are alfo injurious to bilious and plethoric conftitutions, when ufed before the body is cooled by proper evacuations.

SPACE. See Metaphysics, Part II. Chap. iv.
SPACE, in geometry, denotes the area of any figure, or that which fills the interval or diftance between the \(\underbrace{S \text { ain. }}\) lines that tcrminate it.

SPADIX, in botany, anciently fignified the receptacle of the palms. It is now ufed to exprefs every flower-ftalk that is protruded out of a fpatha or fheath.

The fpadix of the palms is branched; that of all other plants fimple. This laft cafe admits of fome variety : in calla, dracontium, and pothos, the florets cover it on all fides; in arum, they are difpofed on the lower part only; and in zoftera on one fide.

SRAGIRIC ART, a name given by authors to that fpecies of chemiftry which works on metals, and is employed in the fearch of the philofopher's ftone.

SPAHIS, horfemen in the Ottoman army, chiefly raifed in Afia. The great ftrength of the grand feignior's army confifts in the janifaries, who are the foot and the fpahis, who are the horfe.

SPAIN, a country of Europe, famous both in ancient and modern hiftory, fituated in that large peninfula which forms the fouth weftern: part of Europe. It is bounded on the fouth and eaft by the Mediterranean fea and ftraits of Gibraltar, on the north and weft by the Bay of Bifcay and Atlantic Ocean, on the fouthweft by Portugal, and on the north-eaft by the Pyrenees.

The moft ancient name of Spain was Iberia, fuppofed Different by fome to be derived from the Iberians, a people inha- names of biting Mount Cancafus, a colony of whom fettled in Spin. this country. Others derive it from the Phenician word Ebra or Ibra, fignifying a paffage or limit. By the Romans it was called Spania or Hi/pania, from the Phenician name Sphanija; and this again fiom Saphan, a Phenician word fignifying a rabbit, bccaufe the weftern part of Spain abounded with thofe animals.
Spain, as well as the reft of Europe, was probably peopled by the Celtes; but the Spanifh hiftorians derive the origin of their nation from Tubal the fitth fon of Japhet, afferting that Spain had bcen a monarchy for 2226 years before the coming of the Celtes into it. Till the coming of the Carthaginians into Spain, how Corquefts ever, nothing certain can be affirmed of the Spaniards; chaginians and this happened not long before the commencementin Spain. of the firft Punic war. Their fuccefs in reducing the country, and their final expulfion by the Romans, has already been related under the articles Rome and CarTHAGE ; we have here therefore only to take notice of the ftate of Spain under the Roman government, until the Romans were in their turn expelled by the northern barbarians.

At the time of the Roman conquef, Spain, though Exceeding prodigious quantities of filver had been carried out of great riches it by the Carthaginians and I'yrians, was yet a very coune rich country. In the mof ancient times, indced, its riches are faid to have exceeded what is related of the molt wealthy country in America. Ariftotle affures us, that when the Phenicians firft arrived in Spain, they exchanged their naval conmodities for fuch immenfe quantities of filver, that their fhips could neither contain nor fuftain its load, though they ufed it for ballaft, and made their anchors and other implements of filver. When the Carthaginians firft came to Spain, they found the quantity of filver nothing leffened, fince the inha: bitants at that time made all their utenfils, and even

4 I 2 mangers,

\section*{S P A [620] S PA}

Spain.

4
Viriathes
oppofes the Roman power wi fuccefs.
mangers, of that precious metal. In the time of the Romans this amazing plenty was very much diminifhed; however, their gleanings were by no means defpicable, fince in the fpace of nine years they carried off 111,542 pounds of filver, and 4095 of gold, befides an immenfe quantity of coin and other things of value. The Spaniards were always remarkable for their braveiy, and fome of Hannibal's beft troops were brought from thence. But as the Romans penetrated farther into the country than the Carthaginians had done, they met with nations whofe love of liberty was equal to their valour, and whom the whole ftrength of their empire was fcarce able to fubdue. Of thefe the moft formidable were the Numantines, Cantabrians, and Aftu. rians.
In the time of the third Punic war, one Viriathus, a celebrated hunter, and afterwards the captain of a gang of banditti, took upon him the command of fome nations who had been in alliance with Carthage, and ventured to oppofe the Roman power in that part of Spain called Lufftania, now Portugal. The prætor, named \(V\) tifius, who commanded in thofe parts, marched againft him with 10,000 men; but was defeated and killed, with the lofs of 4000 of his troops The Romans immediately difpatchẹd another pretor with 10,000 foot and 1300 horfe: but Viriathus having firt cut off a detachment of 4000 of them, engaged the reft in a pitched battle; and having entirely defeated them, reduced great part of the country. A nother pretor, who was fent with a new army, met with the fame fate; fo that, after the deftruction of Carthage, the Romans thought proper to fend a conful named Quintus Fabius, who defeated the Lufitanians in feveral battles, and regained two important places which had long been in the hands of the rebels. A fter the expiration of Fabius's confulate, Viriathus continued the war with his ufual fuccefs, till the fenate thought proper to fend againft him the conful Q. Cæcilius Metellus, an officer of great valour and experience. With him Viriathus did not choofe to venture a pitched battle, but contented himfelf with acting on, the defenfive; in confequence of which the Romans recovered a great many cities, and the whole of Tarraconian Spain was obliged to fubmit to their yokè. The other conful, named Servilianus, did not meet with the fame fuccefs; his army was defeated in the field and his camp was nearly taken by Viriathus. Notwithftanding the good fortune of Metellus, however, he could not withiftand the intrigues of his countrymen againft him, and he was not allowed to finik the war he had begun with fo much fuccefs. In refentment for this he took all imaginable pains to weak. en the army under his command: he difbanded the flower of his troops, exhaufted the magazines, let the elephants die, broke in pieces the arrows which had been provided for the Cretan archers, and threw them into a river. Yet, after all, the army which he gave up to his fucceffor Q. Pompeius, confifting of 30,009 foot and 2000 horfe, was fufficient to have crufhed Viriathus if the general had known how to ufe it. But, inttead of oppofing Viriathus with fuccefs, the imprudent conful procured. much more formidable enemies. The Termantians and Numantines, who had hitherto kept themfelves independent, offered very advantageous terms of peace and alliance with Rome; but Pompeius infifted on their delivering up their arms. Upon this,
war was immediately commenced. The conful with great confidence invefted Numantia; but being repulfed with confiderable loís, he fat down before Termantia, where he was attended with fill worfe fuccefs. I he very frift day, the Termantines killed 700 of his legionaries; took a great convoy which was coming to the Roman camp; and having defeated a confiderable body of their horfe, pufhed them from poft to poft till they came to the edge of a precipice, where they all tumbled down, and were dafhed to picces. In the mean The Ro, \({ }^{7}\) time Servilian, who had been continued in his com-mans fur. mand with the title of proconful, managed matters fo ill, rounded o that Viriathus furrounded him on all fides, and obliged all fides, forced him to fue for peace. The terms offered to the Ro-to cunclud mans were very moderate ; being only that Viriathus apeace wit Thould keep the country he at that time poffeffed, and Viriathuse the Romans remain mafters of all the reft. This peace the proconful was very glad to fign, and afterwards got it figned by the fenate and people of Rome.

The next 'year Q. Pompeius was continued in his command againft the Numantines in Farther Spain, while Q. Servilius Cæpio, the new conful, had for his province Hither Spain, where Viriathus had eftablifhed his new ftate. Pompeius undertook to reduce Numantia by turning afide the fream of the Durius, now the Doure, by which it was fupplied with water; but, is attempting this, fuch numbers of his men were cut off, that, tinding himfelf unable to contend with the enemy, he was glad to make peace with them on much worfe terms than they had offered of their own accord. The peace, however, was ratified at kome; but in the mear time Cæpio, defirous of fhowing his prowefs againt the renowned Viriathus, prevailed upon the Romans to declare war againft him without any provocation. As Cæpio commanded an army greatly finperior to the Lufitanians, Viriathus thought proper to fue for peace; but finding that Cæpio would be fatisfied with nothing lefs than a furrender at difcretion, he refolved to ftand his ground. In the mean time, the latter having bribed fome of the intimate companions of Viriathus to murder him in his fleep, he by that infamous method put an end to a war which had lafted 14 years, very little to the honour of the republic.

After the death of Viriathus, the Romans with like treachery ordered their new conful Popilius to break the treaty with the Numantines. His mfamous conduct met with the reward it deferved; the Numantines fal- the Numq fuch out, put the whole Roman army to flight with tines. fuch flaughter, that they were in no condition to act during the whole campaign. Mancinus, who fucceeded Popilius, met with ftill worfe fuccefs; his great army, confifting of 30,000 men, was utterly defeated by 4000 Numantines, and 20,000 of them killed in the purfuit. The remaining 10,000 , with their general, were pent up by the Numantines in fuch a manner that they could neither advance nor retreat, and would certainly have been all put to the fword or made prifoners, had not the Numantines, with a generofity which their enemies never poffeffed, offered to let them depart upon condition that a treaty fhould be concluded with them upon very moderate terms. This the conful very willingly promifed, but found himfelf unable to perform. On the contrary, the people, not fatisfied with declaring his treaty null and void, ordered him to be delivered up to the Numantines. The latter refufed to accept him, unt

\section*{\(8 \mathrm{P} A \quad[62 \mathrm{I}]\) \\ 3 P A}

Spain. lefs he had along with him the 10,000 men whom they had relieved as above related. At lait, after the conful had remained a whole day before the city, his fucceffor Furius, thinking this a fufficient recompenfe to the Numantines for breaking the treaty, ordered him to be received again into the camp. However, Furius did not choofe to engage with fuch a defperate and refolute enemy as the Numantines had fhowed themfelves; and the war with them was difcontinued till the year 133 B. C. when Scipio 灰milianus, the deftroyer of Carthage, was fent againft them. Againft this renowned commander the Numantines with all their valour were not able to cope. Scipio, having with the utmoft care introduced ftrict difcipline among his troops, and reformed the abufes which his predeceffors had fuffered in their armies, by degrees brought the Romans to face their enemies, which at his arrival they had abfolutely refufed to do. Having then ravaged all the country round about the town, it was foon blocked up on all fides, and the inhabitants began to feel the want of provifions. At laft they refolved to make one defperate attempt for their liberty, and either to break through their enemies, or perifh in the attempt. With this view they marched out in good order by two gates, and fell upon the works of the Romans with the utmoft fury. The Romans, unable to ftand this defperate fhock, were on the point of yielding ; but Scipio, haftening to the places attacked, with no fewer than 20,000 men, the unhappy Numantines were at laft driven into the city, where they futained for a little longer the miferies of famine. Finding at laft, however, that it was altogether impoffible to hold out, it was refolved by the majority to fubmit to the pleafure of the Roman commander. But this refolution was not univerfally approved. Many fhut themfelves up in their houfes, and died of hunger, while even thofe who had agreed to furrender repented their offer, and fetting fire to their houfes, perifhed in the flames with their wives and children, fo that not a fingle Numantine was left alive to grace the triumph of the conqueror of Carthage.

After the deftruction of Numantia the whole of Spain fubmitted to the Roman yoke; and nothing remarkable happened till the times of the Cimbri, when a protorian army was cut off in Spain by the Lufitanians. From this time nothing remarkable occurs in the hiftory of Spain till the civil war between Marius and Sylla. 'The latter having crufhed the Marian faction, as related under the article Rome, proferibed all thofe that had fided. againft him whom be could not immediately deftroy.
great numbers of them were cut off by the Barbarians. This new misfortune obliged Scrtorius to re-embark for Spain; but finding the whole ceaft lined with the troops of Annius, he put to fea again, not knowing what courfe to fteer. In this new voyage he met with a fmall fleet of Cilician pirates; and having prevailed with them to join him, he made a defcent on the coaft of Yvica, overpowered the garrifon left there by Annius, and gained a confiderable booty. On the news of this victory Annius fet fail for Yvica, with a confiderable fquadron, having 5000 land forces on board, Sertorius, not intimidated by the fuperiority of the enemy, prepared to give them battle. But a violent. ftorm arifing, moft of the hips were driven on fhore and dafhed to pieces, Sertorius himfelf with great diffio culty efcaping with the fmall remains of his fleet. For fome time he continued in great danger, being prevented from putting to fea by the fury of the waves, and from landing by the enemy; at latt, the form abating, he paffed the ftraits of Gades, now Gibraltar, and landed near the mouth of the river Bæotis. Here he met with fome feamen newly arrived from the Atlantic or Fortunate Iflands; and was fo taken with the account which they gave him of thofe happy regions, that he refolved to retire thither to fpend the reft of his life in quiet and happinefs. But having communicated this defign to the Cilician pirates, they immediately abandoned him, and fet fail for Africa, with an intention to affift one of the barbarous kings againft his fubjects who had rebelled. Upon this Sertorius failed thither alfor but took Lands in the oppofite fide; and having defeated the kir: named Africa, and Afcalis, obliged hitn to thut himfelf up in the city of arries on Tingis, now Tangier, which he clofely befieged. Butwar in that in the mean time Pacianus, who had been fent by Sylla country. to affift the king, advanced with a confiderable army againft Sertorius. Upon this the latter, leaving part of his forces before the city, marched with the reft to meet Pacianus, whofe army, though greatly fuperior to his own in number, he entirely defeated; killed the general, and took: all his forces prifoners. - The fame of Returns to this victory foon reached Spain; and the Lufitanians, Spain, and being threatened with a new war from Annius, invited \({ }^{\text {defeats the }}\) Sertorius to head their armies. With this risueft he chere. very readily complied, and foon became very formidable to the Romans. 'fitus Didius, governor of that part of Spain called Batica, firt entered the lifts with him ; but he being defeated, Sylla next difpatched Mctellus, reckoned one of the beft commanders in Rome, to itop the progrefs of this new enemy. But Meitlus, notwithftanding all his experience, knew not how to act againft Sertorius, who was continually changing his ftation, putting his army into new forms, and contriving new ftratagems. On his fiift arrival he fent for L. Domitius, then protor of Hither Spain, to his affiltance; but Sertorius being informed of his march, detached Hirtuleins, or Herculeius, his quæfor, againlt hinn, who gave him a total overthrow. Metellus then difpatched Lucius Lollius prætor of Narbonne Gaul againft Hirtuleius; but he met with no better fuccefs, being utterly defeated, and his lieutenant-general killed.
 Sertorius fuch a number of illuftrious Reman citizens fitania into of the Marian faction, that he formed a defign of erect-a republic. ing Lufitania into a republic in oppofition to that of Rome. Sylla was continually fending frefh fupplies to

Metellus ; but Scrtorius with an handful of men, accuftomed to range about the mountains, to endure hunger and thirft, and live expofed to the inclemencies of the weather, fo haraffed the Roman army, that Metellus himfelf began to be quite difcouraged. At laft, Sertorius, hearing that Metellus had fpoken difrefpectfully of his courage, challenged his antagonift to end the war by fingle combat; but Metellus very prudently declined the combat, as being advanced in years; yet this refufal brought upon him the contempt of the

16
Oblizes Metellus raife the
fiege of \(L\) cubriga. retrieve his reputation by fome fignal exploit, and therefore laid ficge to Lacobriga, a confiderable city in thofe parts. This he hoped to reduce in two days, as there was but one well in the place ; but Sertorius, having previoufly removed all thofe who could be of no fervice during the fiege, and conveyed 6000 kins full of water into the city, Metellus continued a long time before it without making any impreflion. At laft, his provifions being almoft fpent, he fent out Aquinus at the head of 6000 men to procure a new fupply; but Sertorius fallins unexpectedly npon them, cut in pieces or took the whole detachment; the commander himfelf being the only man who efraped to carry the news of the difafter; upon which Metellus was obliged to raife the fiege with difgrace.
And now Sertorius, having gained fome intervals of eafe in confequence of the many advantages he had obtained over the Romans, began to civilize his new fribjects. Their favage and furious manner of fighting he changed for the regular order and difcipline of a wellformed army; he beftowed liberally upon them gold and filver to adorn their arms, and by converfung familiarly with them, prevailed upon them to lay afide their own drefs for the Roman toga. He fent for all the children of the principal people, and placed them in the great city of Ofca, now Herefca, in the kingdom of Arragon, where he appointed them mafters to inftruct them in the Roman and Greek learning, that they might, as he pretended, be capable of fharing with him the government of the republic. Thus he made them really hoftages for the good behaviour of their parents; however, the latter were greatly pleafed with the care he took of their children, and all Lufitania were in the higheft degree attached to their new fovereign. This attachment he took care to heighten by the power of fupertition; for having procured a young hind of a milk-white colour, he made it fo tame that it followed him wherever he went; and Sertorius gave out to the ignorant multitude, that this hind was infpired by Diana, and revealed to him the defigns of his enemies, of which he always took care to be well informed by the great numbers of fies he employed.

While Sertorius was thus employed in eftablifhing his authority, the republic of Rome, alarmed at his fuccefs, refolved to crufh him at all events. Sylla was now dead,
come into Spain with a defign to fettle there as Sertosius had done; but as he was defcended from one of the firft families in Rome, he thought it below his disnity to ferve under any general, however eminent he might be. But the troops of Perperna were of a different opinion; and therefore declaring that they would ferve none but a general who could defend himfelf, they to a man joined Sertorius; upon which Perperna himfelf, finding he could do no better, confented to ferve alfo as a fubaltern.

On the arrival of Pompey in Spain, feveral of the cities which had hitherto continued faithful to Sertorius began to waver; upon which the latter refolved, by fome fignal exploit, to convince them that Pompey could no more fcreen them from his refentment than Metellus. With this view he laid fiege to Lauron, now Sertoriz Lirias, a place of confiderable ftrength. Pompey, notbefieges doubting but he fhould be able to raife the fiege, march-Laurou. ed quite up to the enemy's lines, and found means to inform the garrifon that thofe who befieged them were themfelves befieged, and would foon be obliged to retire with lofs and difgrace. On hearing this meffage, "I will teach Sylla's difciple (faid Sertorius), that it is the duty of a general to look behind as well as before him." Having thus fpoken, he fent orders to a detachment of 6000 men, who lay concealed among the mountains, to dome down and fall upon his rear if he fhould offer to force the lines. Pompey, furprifed at their fudden appearance, durft not flir out of his camp; and in the mean time the befieged, defpairing of relief, fur rendered at difcretion, upon which Sertorius granted the fight them their lives and liberty, but reduced their city to Pompey. afhes.

While Sertorius was thus fuccefsfully contending with Pompey, his quaftor Hirtuleius was entirely defeated by Metellus, with the lofs of 20,000 men; 11pon which Sertorius advanced with the utmoft expedition to the banks of the Sucro in Tarraconian Spain, with a Defeats defign to attack Pompey before he could be joined by Pompey Metellus. Pompey, on his part, did not decline the thie banke combat; but, Fearing that Metellus might fhare the of the glory of the victory, advanced with the greateft expedition. Sertorius put off the battle till towards the evening; Pompey, though he knew that the night would prove difadvantageous to him, whether vanquifled or victorious, becaufe his troops were uracquainted with. the country, refolved to venture an engagement, efpecially as he feared that Metellus might arrive in the mean time, and rob him of part of the glory of conquerins fo great a commander. Pompey, who comnaanded his own right wing, foon obliged Perperna, who commanded Sertorius's left, to give way. Hereupon Sertorius himfelf taking upon liin the command of that wing, brought back the fugitives to the charge, and obliged Pompey to fly in his turn. In his flight he was overtaken by a gigantic African, who had already lifted up his hand to difcharge a blow at him with his broad fword; but Pompey prevented him by cutting off his right hand at one blow. As he ftill continued his flight, he was wounded and thrown from his horfe; fo that he would certainly have been taken prifoner, had not the Africans who purfued him quarrelled about the rich furniture of lifs horfe. T'his gave an opportunity to the general to make his efcape; fo that at length he reached his camp with much difficul-

peror Fionorius, the Vandals, Alans, and Suevians, entered this country; and having made themfelves mafters of it, divided the provinces among themelves. In 444 s the \(u\) ef the rever theiseized by e Romans made one effort more to recover their barbarous power in this part of the world; but being utierly de-nations on feated by the Suevians, the latter eftablifhed a kingdom the decline there which lafted till the year 584 , when it was utter. of the wefly overthrown by the Vifgoths under Leovigidd. The Gothic princes continued to reign over a conitiderable part of Spain till the beginning of the 8th century, when their empire was entirely overthrown by the Saracens. During this period, they lad entirely expelled the eaftern emperors from what they poffeffed in Spain, and even made confiderable conquefts in Barbary; but \({ }^{27}\) and made confiderable conquetts in Barbary; but The Gothic towards the end of the 7 the century the Saracens over-kingdom ran all that part of the world with a rapidity which no- overthrown thing could refilt ; and having foon poffeffed themfelves by the saraof the Gothic dominions in Barbary, they made a defcent upon Spain abont the year 7II or 7i2. The king of the Goths at that time was called Roderic, and by his bad conduct had occafioned great difaffection among his fubjects. He therefore determined to put all to the iffue of a battle, knowing that he could not depend upon the fidelity of his own people if lee allowed the enemy time to tamper with them. The two armies met in a plain near Xercs in Andalufia. The Goths began the attack with great fury; but though they fought like men in defpair, they were at laft defeated with exceffive flaughter, and their king himfelf was fuppoled to have perifhed in the battle, being never more heard of.

By this battle the Moors in a fhort time rendered themfelves mafters of almoft all Spain. The poor remains of the Goths were obliged to retire into the mountainous parts of Afturias, Burgus, and Bifcay: the inhabitants of Arragon, Catalonia, and Navarre, though they might have made a conliderable fland againt the enemy, chofe for the molt part to retire into France. In 718 , however, the power of the Goths be-The 28 gan again to revive under Don Pelario or Pelayo, of the , Goths re, who headed thole that had vives under? retired to the mountains after the fatal battle of Xeres. Pelagio, The place where he firlt laid the foundation of his government was in the Afturias, in the province of Lie. bana, about ninc leagues in length and four in breadth. This is the moft inland part of the country, full of mountains enormoufly high, and fo much fortifed by nature, that its inhabitants are capable of refifting almoft any number óf invaders. Alakor the Saracen governor was no fooner informed of this revival of the Gothif kingdom, than he fent a powerful army, under the command of one Alchamara, to crufh Dora Pelagio before he had time to eltablioh his power. The king, though his forces were fufficiently numerous (every one \(\mathrm{He}^{29}\) of his fubjects arrived at man's eftate being a foldier) the Saradid not think proper to venture a general engagement dreadful in the open field; but taking port with part of them overthrow himfelf in a cavern in a very high motntain, he concealed the reft among precipices, giving orders to them to fall upon the enemy as foon as they fhould perceive him attacked by them. 'Thefe orders were punctually executed, though indecd Don Pelagio himfelf had repulfed his enemies, but not without a miracle, as the Spanifh hiftorians pretend. 'The flaughter was dreadful; for the troops who lay in ambufcade joining the

Spain. roit, and rolling down huge fones from the mountains upon the Moors (the name by which the Saracens were known in Spain), , io fewer than 124,000 of thefe unhappy people perifhed in one day. The remainder fled tlll they were fopped by a river, and beginning to coaf it, part of a mountain fuddenly fell down, ftopped up the channel of the river, and either crufhed or drowned, by the futden riling of the water, almoft every one of that vaft army.
The Moors were not fo much difheartened by this
30 difatter, but that they made a fecond attempt againft Another. Don Pelagio. Their fuccefs was as bad as ever, the army cut in finces or taken. greateft part of their army being cut in pieces or taken; in confequence of which, they loft all the Afturias, and never dared to enter the lifts with Pelagio afterwards. Indeed, their bad fuccefs had in a great meafure taken from them the defire of conquering a country where littlie or nothing was to be got; and therefore they rather directed their force againft France,
35 The Sara try they poped in prodivis miltitudes, but were crins utterly utterly defeated, in 732, by Charles Martel, with the cifeated by lofs of 300,000 men, as the hiftorians of thofe times Martel. pretend.

Don Pelagio died in 737 , and foon after his death fuch inteftine divifions broke out among the Moors, as greatly favoured the increafe of the Chritian power. In 745 Don Alonfo the Catholic, for-inlaw to Pelagio, in conjunction with his brother Froila, paffed the mountains, and fell upon the northern part of Galicia; and meeting with little refiftance, he recovered almoft
Conquefts the whole of that province in a fingle campaign. Next af the Chri- year he invaded the plains of Leon and Cattile; and Rians. before the Moors could affemble any force to oppofe him, he reduced ARorgas, Leon, Saldagna, Montes de Oca, Amaya, Alava, and all the country at the foot of the mountains. The year following he pufhed his conquefts as far as the borders of Portugal, and the next campaign ravaged the country as far as Caftile. Being fenfible, however, that he was yet unable to defend the Alat country which he had conquered, he laid the whole of it wafte, obliged the Chriftians to retire to the mountains, and carried off all the Moors for flaves. Thus fecured by a defert frontier, he met with no interruption for fome years; during which time, as his kingdom advanced in ftrength, he allowed his fubjects gradually to occupy part of the flat country, and to rebuild Leon and Aftorgas, which he had demolifhed.
33 He died in 757, and was fucceeded by his fon Don The jara. Froila. In his time Abdelrahman, the khaliff's vicecens in roy in Spain, threw off the yoke, and rendered himSpainthrow felf independent, fixing the feat of his government at
off the yoke off the yoke cordova. Thus the inteftine divifions among the lif. Moors were compofed; yet their fuccefs feems to have been little better than before; for, foon after, Froila encountered the Moors with fuch fuccefs, that 54,000 of them were killed on the fpot, and their general taken prifoner. Soon after he built the city of Oviedo, which he made the capital of his dominions, in order to be in a better condition to defend the flat country, which he now determined to peopie.
In the year \(75^{8}\) the power of the Saracens received another blow by the rife of the kingdom of Navarre. This kingdom, we are told, took its origin from an accidental meeting of gentlemen, to the number of 600 ,
at the tomb of an hermit named \(\mathcal{F}\) obn, who had died among the Pyrences. At this place, where they had met on account of the fuppofed fanctity of the deceafed, they took occation to converfe on the cruelty of the Moors, the miferies to which the country was expofed, and the glory that would refult from throwing off their yoke; which, they fuppofed, might eatily be done, by reafon of the ftrength of their country. On mature deliberation, the project was approved; one Don 'Garcia Ximenes was appointed king, as being of illuftrious birth, and looked upon as a perfon of great abilities. He recovered Ainfa, one of the principal towns of the country, out of the lands of the infidels, and his fucceffor Don Garcia Inigas extended his territories as far as Bifcay ; however, the Moors ftill poffeffed Por. tugal, Murcia, Andalufia, Valentia, Granada, Tortofa, with the interior part of the country as far as the mountains of Caftile and Saragoffa. Their internal diffenfions, which revived after the death of Abdelrahman, contributed greatly to reduce the power of the infidels in general. In 778, Charles the Great being invited Ly fome difcontented Moorifh governors, entered Spain of Chary with two great armies ; one paffing through Catalonia, the Grea and the other throügh Navarre, where he pufhed his conquefts as far as the Ebro. On his return he was attacked and defeated by the Moors; though this did not hinder him from keeping poffeffion of all thofe places he had already reduced. At this time he feems to have been mafter of Navarre: however, in 83 I count Azner, revolting from Pepin fon to the emperor Louis, again revived the independency of Navarre; but the fovereigns did not affume the title of kings till the time of Don Garcia, who began to reigu in \(857^{\circ}\)

In the mean time, the kingdom founded by Don Pe lagio, now called the kingdom of Leon and Oviedo, continued to increafe rapidly in ftrength, and many advantages were gained over the Moors, who having two enemies to contend with, loft ground every day. In 921, however, they gained a great victory over the united forces of Navarre and Leon, by which the whole ferce of the Chriftians in Spain muft have been entirely broken, had not the victors conducted their affairs fo wretchedly, that they fuffered themfelves to be almoft entirely cut in pieces by the remains of the Chritian army. In fhort, the Chriftians becaine at length fo terrible to the Moors, that it is probable they could not long have kept their footing in Spain, had not a great Exploit general, named Mohammed Ebn Amir Almanzor, ap. Almanz peared, in 979, to fupport their finking caufe. This man was vifir to the king of Cordova, and being exceedingly provoked againft the Chriftians on account of what his countrymen had fuffered from them, made war with the molt implacable fury. He took the city of Leon, murdered the inhabitants, and reduced the houfes to afhes. Barcelona fhared the fame fate ; Caftile was reduced to a defert; Galicia and Portugal ravaged; and he is faid to have overcome the Chriftians in fifty different engagements. At laft, having taken and demolifhed the city of Compoftella, and carried off in triumph the gates of the church of St James, a flux happened to break out among his troops, which the fuperftitious Chriftians fuppofed to be a divine judgement on account of his facrilege. Taking it for granted, therefore, that the Moors were now entirely deftitute of all heavenly aid, they fell upon them with

\section*{\(S\) P. A \\ [ 625 ] \\ \(S\) PA}
fuch fury in the next engagement, that all the valour and conduct of Almanzor conld not prevent a defeat. Overcome with fhame and defpair at this misfortune, and he defired his followers to fhift for themfelves, while he himfelf retired to Medina Coeli, and put an ond to his life by abftinence in the year 998.

During this period a new Chriftian principality appeared in Spain, namely that of Caftile, which is now divided into the Old and New Caftile. The Old Caftile was recovered long before that called the Nerw. It was feparated from the kingdom of Leom on one fide by fome little rivers; on the other, it was bounded by the Afturias, Bifcay, and the province of Rioja. On the fouth it had the mountains of Segovia and Avila; thus lying in the middle between the Chriftiau king. dom of Leon and Oviedo, and the Moorim kingdom of Cordova. Hence this ditrict foon became an object of contention between the kings of Leon and thofe of Cordova; and as the former were generally victorious, fome of the principal Caftilian nobility retained their independency under the protection of the Chriftian kings, even when the power of the Moors was at its greateft heiglit. In 884 we firt hear of Don Rodriguez affuming the title of count of Cafile, though it does not appear that either his territory or title were given him by the king of Leon. Neverthelefs, this monarch having taken upon him to punifh fome of the Caftilian lords as rebels, the inhabitants made a formal renunciation of their allegiance, and fet up a new kind of government. The fupreme power was now vefted in two perfons of quality ftyled judges ; however, this method did not long continue to give fatisfaction, and the fovereignty was once more vefted in a fingle perfon. \(13 y\) degrees Caltile fell entirely under the power of the kings of Leon and Oviedo; and, in 1035 , Don Sanchez beftowed it on his eldeft fon Don Ferdinand, with the title of king; and thus the territories of Caftile were firt firmly united to thofe of Leon and Oviedo, and the fovereigns were thenceforth ftyled kings of Leon and Caftile.

Befides all thefe, another Chriftian kingdon was.s fet up in Spain about the beginning of the 11 th century. This was the kingdom of Arragon. The inhabitants were verys brave, and lovers of liberty, fo that it is probable they had in fome degree maintained their independency, even when the power of the Moors was greatelt. ' The hitory of Arragon, however, during its. infancy, is much lefs known than that of any of the others hitherto mentioned: We are only affured, that about the year 1035, Don Sanchez, furnamed the Great, king of Navarre, erected Arragon into a kingdom in favour of his fon Don Ramira, and afterwards it became very powerful. At this time, then, we may imagine the continent of Spain divided into two unequal parts by a ftraight line drawn from êaft to weft, from thescoats of Valentia to a little below the mouth of the Duro. The country north of this belonged to the Chriftians, who, as yet, had the fmalleft and leaft valisable fhare, and all the reft to the Moors. In point of wealth and real power, both by land and fea, the Moors were greatly fuperior \(;\) but their continual dif fenfions greatly weakened them, and every day facilitated the progrefs of the Chriftians. Indeed, had either of the parties been united, the other muft foon have yielded; for thourl the Chritians did not make war a: Vol. XVII. Part II.
upon each other conftantly as the Moors did, their mutual feuds were yet fufficient to have ruined them, had their adverfaries made the leat ufe of the advantages thus afforded them. But among the Moors almof every city was a kingdom; and as thefe petty fovereignties fupported one another very indifferently, they fell a prey one after another to their enemies. In 1080 , the king of Toledo was engaged in a war with the kinr of Seville, another Moorifh potentate; which being ob.ferved by Alphonfo king of Caftile, he alfo invaded his territories; and in four years made. himfelf maiter of Toledo and the city of Toledo, with all the places of importance in Madrid taits neighbourhood; from thenceforth making Toledo ken by the the capital of his dominions. In a fhort time the whole Chriftians province of New Caftile fubmitted; and Madrid, the prefent capital of Spain, fell into the hands of the Chrifians, being at that time but a fmall place.

The Moors were fo much alarmed at thefe conquefts, that they not only entered into a general confederacy asainf the Chrifiams, but invited to their affitance Mahomet Ben Jofeph the fovereign of Barbary. He a fignal accordingly came, attended by an incredible multitude; victory but was utterly defeated by the Chriftians in the defiles yained over of the Black Mountain, or Sierra Morena, on the bor- the Moors. ders of Andalufia. This victory happened on the 16 th of July 1212, and the anniverfary is fill celebrated at Toledo. This vi\&tory was not improved; the Chriftian army immediately difperfed themfelves, while the Moors of Andalufia were Atrengthened by the remains of the African army ; yet, inftead of being taught, by their paft misfortunes, to unite among themfelves, their diffenfions became worfe than ever, and the conquefts of the Chriftians became daily more rapid. In 1236 , Lon Ferdinand of Caftile and Leon took the celebrated city of Cordova, the refidence of the firft Moorifh kings; at the fame time that James I. of Arragon difpoffeffed them of the inland of Majorca, and drove them out of Valentia. Two years after, Ferdinand made hinfelf malter of Murcia, and took the city of Seville ; and in 1.303 Ferdinand IV. reduced Gibraltar.

In the time of Edward III. we find England, for the England ine firt time, interfering in the affairs of Spain, on the fol-terferes in lowing occafion. In the year 1284 the kingdom of Na - the Spaniff varre had been united to that of France by the mar- affairs. riage of Donna Joanna queen of Navarre with Philip the Fair of France. In 1328 , however, the kingdoms were again feparated, though the fovereigns of Navarre were fill related to thofe of France. In I 350, Charles, furnamed the Wicked, afcended the throne of Navarre, and married the daughter of John king of France. Notwithftanding this alliance, and that he himfelf was, related to the royal family of France, he fecretly entered into a negociation with England againft the French: monarch, and even drew into his fchemes the dauphini Charles, afterwards furnamed the Wife. The young prince, hówever, was foon after made fully fenfible of. the danger and folly of the connections into which he. liad entered; and, byiway of atonement, promifed to facrifice his affociates. Accordingly he invited the king of Navarre, and fome of the priacipal nobility of the fame party, to a feaft at Rouen, where he betrayed them to his father. 'The moft obnoxious were execu-i The king of ted, and the king of Navarre was thrown into prifon. Navarreims, In this extremity, the party of the king of Navarre had prifoned by recourfe to England. the Black Prince, invaded France, defeated king John at Poictiers, and took him prifoner \(\dagger\); which unfortunate event produced the mof violent difturbances in that kingdori. The dauphin, now about 19 years of are, naturally aflumed the royal power during his father's captivity: but poffeffed neither experience nor authority fufficient to remedy the prevailing evils. In order to obtain fupplies, he affembled-the ftates of the kingdom: but that affembly, inftead of fupporting his adininiftration, laid hold of the prefent opportunity to demand limitations of the prince's power, the punifhment of paft malverfations, and the liberty of the king of Navarre. Marcel, provoft of the mercliants of Paris, and firft magitrate of that city, put himfelf at the head of the unruly populace, and pufhed them to commit the mof criminal outrages againft the royal authority. They detained the dauphin in a kind of captivity, murdered in his prefence Robert de Clermont and John de Contflans, marefchals of France; threatened all the other minifters with the hike fate; and when Charles, who had been obliged to temporize and diffemble, made his efcape from their hands, they levied war againit him, and openly rebelled. The other cities of the kingdom, in imitation of the capital, fhook off the dauphin's authority, took the government into their own hands, and fpread the contagion into every province.

Amidft thefe diforders, the king of Navarre made his efcape from prifon, and prefented a dangerous leader to the furions malecontents. He revived his pretenfions to the crown of France: but in all his operations he acted more like a leader of banditti than one who afpired to be the head of a regular government, and who was engaged by his fation to endeavour the re eftablifhment of order in the community. All the French, therefore, who wifhed to reftore peace to their country, turned their eyes towards the dauphin; who, though not remarkable for his military talents, daily gained by his prudence and vigilance the afcendant over his enemies. Marcel, the feditious provoft of Paris, was flain in attempting to deliver that city to the king of Navarre. The capital immediately returned to its duty : the moft confiderable bodies of the mutinous peafants were difperfed or put to the fword; fome bands of military robbers underwent the fame fate; and France began once more to affume the appearance of civil government.

John was fucceeded in the throne of France by his fon Charles V. a prince educated in the fchool of adverfity, and well qualified, by his prudence and experience, to repair the loffes which the kingdom had futtained from the errors of his predeceffors. Contrary to the practice of all the great princes of thofe times, who held nothing in eftimation but military courage, he feems to have laid it down as a maxim, never to appear at the head of his armies; and he was the firf European monarch that fhowed the advantage of policy and forefight over a ralh and precipitate valour.

Before Charles could think of counterbalarcing fo great a power as England, it was neceffary for him to ro defeated was expofed. He accordingly turned his arms againft and obliged the king of Navarre, the great difturber of France duzofubmit to the terms prefrihed ed by Crined ced him to terms, by the valour and conduct of Berof Erance.
tains of thofe times, whom Charles had the difecmment to choofe as the inftrument of his vietorics. He alfo fettled the affairs of Brittany, by acknowledging the title of Mountfort, and receiving homage for his dominions. But much was yet to be done. On the conclufion of the peace of Bretigni, the many inilitary adven turers who had followed the fortunes of Edward, being difperfed into the feveral provinces, and poffeffed of ftrongholds, refufed to lay down their arms, or relinquifh a courfe of life to which they were now accuftomed, and by which alone they could earn a fubliftence. They affociated themfelves with the banditti, Accou who were already inured to the habits of rapine and the bal violence; and, under the name of companies and compa-panies nisns, became a terror to all the peaceable inhabitants. ponnpan Some Englifh and Gafcon gentlemen of character were not afhamed to take the command of thefe ruffians, whofe number amonnted to near 40,000 , and who bore the appearance of regular armies rather than bands of robbers. As Charles was not able by power to redrefs fo enormous a grievance, he was led by neceffity, as well as by the turn of his character, to correct it by poliey; to difcover fome method of difcharging into foreign countries this dangerous and inteftine evil ; and an occafion now offered.

Alphonfo XI. king of Caftile, who took the city of Reign Algezira from the Moors, after a famons fiege of two Peter years, during which artillery are faid firf to have been of Cruel, ufed by the befieged, had been fucceeded by his fon Peter I. furnamed the Cruel, a prince equally perfidious, debauched, and bloody. He began his reign with the murder of his father's miftrefs Leonora de Gufinan: his nobles fell every day the victims of his feverity: he put to death bis coufin and one of his natural brothers, from groundlefs jealoufy; and he caufed his queen Blanche de Bourbon, of the blood of France, to be thrown into prifon, and afterwards poifoned, that he might enjoy in quiet the embraces of Mary de Padella, with whom he was violently enamoured.

Henry count of Traftamara, the king's natural brother, alarmed at the fate of his family, and dreading his own, took arms againft the tyrant; but having failed in the attempt, he fled to France, where he found the minds of men much inflamed againft Peter, on account of the murder of the French princefs. He afked per-The \({ }^{40}\) mifion of Charles to enlift the companies in his fervice, panies and to lead them into Caftile againft his brother.' The ployed French king, charmed with the project, employed du gainft Guefclin in negociating with the leaders of thefe banditti. 'The treaty was foon concluded; and du Guefclin having completed his levies, led the army firt to Avignon, where the Pope then refided, and demanded, fword in hand, abfolution for his ruffian foldiers, who had been excommunicated, and the fum of 200,000 livres for their fubfiftence. The firf was readily promifed him; but fome difficulty being made with regard to the fecond, du Guefclin replied, "My fellows, I believe, may make a fhift to do without your abfolution, but the money is abfolutely neceflary." His Holinefs then extorted from the inhabitants of the city and. its neighbourhood the fum of 100,000 livres, and of fered it to du Guefclin: "It is not my purpofe (cried that generous warrior) to opprefs the imnocent people." The pope and his cardinals can fare me double the fum from their own pockets. I therefore infift, that. 8

\section*{S P A \\ [. 627 ] \\ S P A} they are defrauded of it, I will myfelf return from the other fide of the Pyrenees, and oblige you to make them reflitution." The pope found the neceffity of fubmitting, and paid from his own treafury the fum demanded.
A body of experienced and hardy foldiers, conducted by fo able a general, eafily prevailed over the king of Catile, whole fubjects were ready to join the enemy againt their oppreflor. Peter fled from his dominions, took fhelter in Guienne, and craved the protection of the prince of Wales, whom his father had invefted with the fovereignty of the ceded provinces, under the title of the 'principality of Aquitaine. The prince promifed his affiftance to the dethroned monarch; and having obtained his father's confent, he levied an army, and fet out on his enterprife.

The firt lofs which Henry of Traftamara fuffered from the interpofition of the prince of Wales, was the recalling of the companies from his fervice; and fo much reverence did they pay to the name of Edward, that great numbers of them immediately withdrew from Spain, and inlifted under his ftandard. Henry, however, beloved by kis new fubjects, and fupported by the king of Arragon, was able to meet the enemy with an army of 100,000 men, three times the number of thofe commanded by the Black Prince: yet du Guefclin, and all his experienced officers, advifed him to delay a decifive action; fo high was their opinion of the valour and conduct of the Englifh hero! But Henry, trufting to his, numbers, ventured to give Edward battle on the banks of the Ebro, between Najara and Navarette; where the French and Spaniards were defeated, with the lofs of above 20,000 men, and du Guefclin and other officers of diftinction taken prifoners. All Caftile fubmitted to the vietor; Peter was reftored to the throne, and Edward returned to Guienne with his ufual glory; laving not only overcome the greateft general of his age, but reftrained the moft blood-thirfty tyrant from executing vengeance on his prifoners.
This gallant warrior liad foon reafon to repent of his connections with a man like Petcr, loft to all fenfe of virtue and honour. The ungrateful monfter refufed the flipulated pay to the Englifh forces. Edward abandoned him : he treated his fubjects with the utmoft barbaxity ; their animofity was roufed againf him ; and du Guefclin having obtaincd his ranfom, returned to Caftile with the count of Traftamara, and fome forces levied anew in France. They were joined by the Spanifh malecontents; and laving no longer the Black Prince to解 neighbourhood of Toledo. The tyrant now took refuge in a cafte, where he was foon after befieged by the victors, and taken prifoner in endeavouring to make his efcape. He was conducted to his brothcr Henry ; againet whom he is faid to have rufhed in a tranfport of rage, difarmed as he was. Henry flew him with his own hand, in refentment of his cruelties; and, though a baftard, was placed on the throne of Cattile, whicir he tranfinitted to his pofterity.
Aifter the death of Peter the Cruel, nothing remarkable happened in Spain for almoft a whole century; but the debaucheries of Henry IV. of Caftile roufed the re§entment of his nobles, and produced a moft fingular in-
furrection, which led to the aggrandizement of the Spanifh monarchy.

This prince, furnamed the Impotent, though conti- Reign of 53 nually furrounded with women, began his unhappy reign Henry the in 1454. He was totally enervated by his pleafures; Impotent. and every thing in his court confpired to fet the Caftilians an example of the mof abject flattery and moft abandoned licentioufnefs. The queen, a daughter of Portugal, lised as openly with her parafites and her gallants as the king did with his minions and his miftreffes. Pleafure was the only object, and effeminacy the only recommendation to favour : the affairs of the ftate went every day into diforder; till the nobility, with the archbifhop of Toledo at their head, combining againft the weak and flagitious adminiftration of Henry, arrogated to themfelves, as one of the privileges of their order, the right of trying and paffing fentence on their fovereign, which they executed in a manner unprecedented in hiftory.

All the malecontent nobility were fummoned to meet He is fors at Avila: a fpacious theatre was erected in a plainmally de. without the walls of the town : an image, reprefenting pufed. the king, was feated on a throne, clad in royal robes, with a crown on its head, a fceptre in its hand, and the fword of juftice by its fide. The accufation againft Henry was read, and the fentence of depofition pronounced, in prefence of a numerous affembly. At the clofe of the firf article of the charge, the archbilhop of Toledo advanced, and tore the crown from the head of the image; at the clofe of the fecond, the Conde de Placentia fnatched the fword of jultice from its fide; at the clofe of the third, the Conde de Benavente wretted the feeptre from its hand; and at the clofe of the laft, Don Diego Lopez de Stuniga tumbled it headlong from the throne. At the fame inftant, Don Alphonfo, Henry's brother, a boy of about twelve years of age, was proclaimed king of Caftile and Leon in his ftead.

This extraordinary proceeding was followed by a civil war, which did not ceafe till fome time after the death of the young prince, on whom the nobles had beftowed the kingdom. The archbifhop and his party then continued to carry on war in the name of Ifabella the king's fifter, to whom they gave the title of Infanta ; and Henry could not extricate himfelf out of thefe Is obisged troubles, nor remain quiet upon his throne till he had to acknowa figned one of the moft humiliating treatics ever extort- ledge his ed from a fovereign ; he acknowledged his fifter Ifabel-bella to be la the only lawful heirefs of his kingdom, in prejudiceheirefs to to the rights of his reputed daughter Joan, whom the \({ }^{\text {the }}\) kingmalecontents affirmed to be the offspring of an adulter- dom. ous commerce between the queen and Don la Cueva. The grand object of the malecontent party now was the marriage of the princefs Ifabella, upon which, it was evident, the fecurity of the crown and the happinefs of the people muft in a great meafure depend. The alliance was fought by feveral princes : the king of Portugal offered her his land ; the king of France demanded her for his brother, and the king of Arraron 56 manded her for his brother, and the king of Arragon 3 he \(16 \mathrm{mar-}\)
for his fon Ferdinand. The malecontents very wifely ried te Ferpreferred the Arragonian prisce, and Ifabella prudent- dinand of ly made the fame choice: articles were drawn up; and Aragon. they were privately married by the archbifop of 'To. ledo.

\$pair. Henry was enraged at this alliance, which he forefaw would utterly ruin his authority, by furnifhing his rebellious fubjects with the fupport of a powerful neighbouring prince. He difinherited his fifter, and eftablifhed the rights of his daughter. A furious civil war defolated the kingdom. The names of Joan and Ifabella refounded from every quarter, and were everywhere the fummons to arms. But peace was at length brought about. Henry was reconciled to his fifter and Ferdinand; though it does not appear that he ever renewed Ifabella's right to the fucceffion : for he affirmed in his laft moments, that he belicved Joan to be his own daughter. The queen fwore to the fame effect ; and Henry left a teftamentary deed, tranfmitting the crown to this princefs, who was proclaimed queen of Caftile at Placentia. But the Superior fortune and fuperior arms of Ferdinand and Ifabella prevailed : the king of Portugal was obliged to abandon his niece and intended of war. Joan retired into a convent ; and the death of Ferdinand's father, which happened about this time, added the kingdoms of Arragon and Sicily to thofe of Leon and Caftile.
Frdinand and Ifabella were perfons of great prudence, and, as fovcreigns, highly worthy of imitation: but they do not feem to have merited all the praifes befowed upon them by the Spanif hiftorians. They did not live like man ard wife, having all things in common under the dircetion of the hurband; but like two princes in clofe alliance; they neither loved nor hated cach other; were feldom in company togethcr; had each a feparate council; and were frequently jealous of one another in the adminiftration. But they were infeparably united in thcir common interefts; always acting upon the fame principles, and forwarding the fame ends. 'Their firft object was the regulation of their government, which the civil wars had thrown into the greateft diforder. Rapine, outrage, and murder, were become fo common, as not only to interrupt commerce, but in a great meafure to fufpend all intercourfe between one place and another. Thefe evils the joint fovereigns fuppreffed by their wife policy, at the fame time that they extended the royal prerogative.
About the middle of the \(13^{\text {th }}\) century, the cities in the kingdom of Arragon, and after their example thofe in Cafile, had formed themfclves into an affociation, diftinguifhed by the name of the Holy Brotberbood. They exacted a certain contribution from each of the affociated towns ; they levied a conf:derable body of troops, in order to protect travellers and purfue crimi. nals; and they appointed judges, who opened courts in various parts of the kingdom. Whoever was. guilty of murder, robbery, or any act that violated the public peace, and was feized by the troops of the Brother. hood, was carried before their judges; who, without paying any regaid to the exclufive juriftiction which the lord of the place might claim, who was generally the author or abettor of the injuftice, tried and condemmed the criminals. The nobles often murmured againt this falutary inflitution; they complained of it as an encroacliment on one of their moft valuable privileges, and endeavourtd to get it abolifhed. But Ferdinand and Irabella, fenfible of the beneficial effeets of the Brotherhood, not only in regard to the police of their kingdom, but in its tendency to abridge, and by de-
grecs annihilate, the territorial juridiction of the nobi. lity, countenanccd the inlitution upon every occafion, and fupported it with the whole force of royal authority ; by which means the prompt and impartial adminiffration of juffice was reftored, and with it tranquillity and order returned.

But at the fame time that their Catholic majeflies (for fuch was the title they now boie) were giving vigour to their civil government, and fecuring their fubjects from violence and oppreffion, an intemperate zeal led them to eftablifh an ecclefiafical tribunal, equally contrary to the natural righte of humanity and the mild fpirit of the gofpel. This was the court of inquifition; which decides upon the honour, fortune, and even the lie, of the unhappy wretcli who hapyens to fall under the furpicion of 'herefy, or a contempt of any' thing prefcribed by the church, without liis knowing, being confronted with his accufers, or permitted either defence or appeal. Six thoufand perfois were burnt by order of this fanguinary tribunal within four years after the appointrient of Törquemada, the firft inqui-fitor-general ; 'and upwards of 100,000 felt its fury. The fame furions and blinded zeal which led to the depopulation of Spain, led alfo to its aggrandizement.

The kingdom of Granada now alone remained of all Congul the Mahometan poffeffions in-Spain. Princes equally of Grai zealous and ambitious were naturally diipofed to turn their eyes to that fertile territory, and to think of increafing their hcreditary dominions; by expelling the enemies of Chrifianity, and extending its doctrines. Every thing confpired to favour their project: che Moorifh kingdom was a prey to civil wars; when Ferdinand, having obtained the bull of Sixtus IV. authorizing a crufade, put himfelf at the head of his troops, and entered Granada. He continued the war with rapid fuccefs: Ifabella attended him in feveral expeditions; and they were both in great danger at the fiege of Malaga; an important city, which was defended with great courage, and taken in 1487. Beza was reduced in 1489, atter the lofs of 20,050 men. Guadix and Almeria were delivered up to them by the Moorifh king Alzagel, who had firft detlironed his brother A1boacen, and afterwards been chaled from his capital by his nephew Abdali. That prince engaged in the fervice of Ferdinand and 1fabella; who, after reducing every other place of eminence, undertook the fiege of Granada. A bdali made a gallant defence; but all commurcation with the country being cut off, and all hopes of relief at an end, he capitulated, after a fiege of eight months, on condition that he flould enjoy the revenne of certain places in the fertile mountaiis of Alpuijarros; that the inhabitants fhould retain the undifturbed poffeffion of their houfes, goods, and inheritances; the ufe of their laws, and the free exercife of their religion. Thus ended the empire of the Arabs in Spain, after it had continued about \(8 c 0\) years. They introduced the arts and fciences into Europe at a time when it was loft in darknefs; they poffeffed many of the lnxuries of life, when they were not even known among the neighbouring nations ; and they feem to bave given birth to that romantic gallantry which fo eminently prevailed in the ages of chivaly, and which, blencing itfelf with the veneration of the northern nations for the fofter fex; ftill particularly diftinguifhes ancient from modern marn

\section*{S P A [629] S P A}

Spain. nerse But the Moors, hotwithtanding thefer advanta. ges, and the eulogies beftowed upon them by fome writers, appear always to have been deftitute of the effential qualities of a polifhed people, humanity, generofity,
62 - and mutual fympathy. fion, or \(r\) nqueft of Granada was followed by the expulwha had engrofed all the wealth and commerce of \(S\) ews, The inquifition exhaufted its rare againt thefe unhanpy people, many of whom pretended to embrace Chriftianity; in order 'to preferve their property. About the fame time their Catholic majefties concluded an alliance with the emperor Maximilian, and a trdaty of marriage for their daughter Joan with his fon Phllip, archduke of Autria and fovereign of thic Netherlands. About this , time alfo the contract was concluded with Chriftopher Columbus for the difcovery of new countries; and the counties of Ronffillon and Cerdagne were agreed to be reftored by Charles VIII. of France, before his expedition into Italy. 'The difcovery of America was foon followed by estenfive conquelts in that quarter, as is related under the articles Mexico, Perv, Chili, I\&c. which tended to raife the Spanifh monarchy above any other in Europe.
On the death of Ifabella, which happened in 1 jof, Philip archduke of Auftria came to Cattile in order to take poffeffion of that kingsom as beir to his motherinlaw ; but he dying in a fhort time after, his fon Charles V . afterwards: emperor of Germany, became heir to the crown of Spain. Iris father at his death left the king of France governor to the young pince, and Ferdinand at his death left cardinal Ximenes fole regent of Cattile, till the arival of his grandfon. This man, whole character is no lefs fingular than illuatrious, who united the abilities of a great ftatefman with the abject devotion of a fuperfitious monk, and the magnificence of a prime miniller with the feverity of a mendicant, maintained order and tranquillity in Spaii, notwithiltanding the difcontents of a turbulent and highfpirited nobility. When they difputed his right to the regency; he coolly fhowed them the teftament of Ferdinand, and the ratification of that deed by Charles; but thefe not fatisfying them, and argument proving ineffectual, he led them infenfibly towaids a balcony, whence they liad a view of a large body of troops under arms, and a formidable train of artillery. "Behold (faid the cardinal) the powers which I have received from his Catholic majefty: by thefe I govern Caltile; and will govern it, till the king, your mafter and mine, fhall come to take poffeffion of his kingdom." A declaration fo bold and determined filenced allop:wfition; and Ximenes maintained his authority till the arrival of Charles in 1517 .

The young king was received with univerfal acclamations of joy ; but Ximenes found little caufe to rejoice. He was feized with a violent diforder, fuppofed to be the effect of poifon; and when he recovered, Charles, prejudiced againft him by the Spanifh grandees and his Flemifh courtiers, flighted his advice, and allowed him every day to fink into neglect. The cardinal did not bear this treatment with his ufual fortitude of fpirit. He expected a more grateful return from a prince to :whom he delivered a kingdom more flourifhing than it Fiad been in any former agc, and authority more extenfive and better eftabliited than the molt illuftrious of his
anceftors had ever poffeffed. Confcious of his own in. Spain. tegrity and merit, he could not therefore refrain from giving vent, at times, to indignation and complaint. He lamented the fate of his country, and foretold the calamities to which it would be' exporea from the infolence, the rapacioufnefs, and the ignorance of ftrangers. But in the mean time he received a letter from the king, difmiffing hin from his conncils, under pretence of ea. fing his age of that burden which' he had fo long and fo ably fuftained. This letter proved fatal to the minifter ; for he expired in a few hours after reading it.
\(68{ }^{\circ}\)
While Charles was taking poffeffion of the throne of Maximiliand Spain, in confequence of the death of one grandfather, ateenpts to another was endeavouring to obtain for him the impe- elet cected ent. rial crown. With this view Max innilian affembled a dier perore at Augfuarg, where he cultivated the favour of the electors by many aets of beneficence, in order to cngage them to choofe that young prince as his fucceffor. But Maximilian himfelf never having been crowned by the pope, a ceremany deemed effential in that age, as well as in the -preceding, he was confidered only as king of the Romans, or emperor elect ; and no example occurring in hiffory of any perfon being chofen fucceffion to a king of the Romans, the Gernians, always tenacious of their forms, obltinately iefufed to confer upon Charles a dignity for which their conflitution knew no name.

But though Maxiniliain could not' prevail upon the German electors to choofe his grandfon of Spain king of the Rominas, he had difpofed their minds in favour of that prince; and other circumftances, on the death of the emperor, confpired to the exaltation of Charles. The imperial crown had fo long continued in the Auflrian line, that it began to be confidered as hereditary in that family; and Germany, torn by religious difputes, \({ }^{2}\) food in need of a powerful emperor, not only to preferve its own internal tranquillity, but alfo to proteet it againt the victorious arms of the Turks, who under Selimi I.! threatened the liberties of Europe. This fierce and rapid conqueror had already fubdued the Mamalukes, and made himfelf mafter of Egypt and Syria. 'the power of Charles appeared neceflary to oppofethat of Selim. The extenfive dominions of the houfe of Auftria, which gave him an interelt in the prefervation of Getinany ; the rich fovereignty of the Netherlands and Franclie Compte; the entire poffeffion of the great and warlike king dom of Spain, together with that of Naples and Sicily, all united to hold him up to the firt dignity among Chriftian princes; and the new world feemed only to be called into exiftence that its treafures might enable him to defend Chrifendom ayainft the infidels. Such was the language of his partifans.

Francis I . however, no fooner received intelligence of Franc c I I . the death of Maximilian, than he declared himfelf a can- afpires to. didate for the empire ; and with no lefs confidence of the fame. frucefs than Charles. He trufted to his fuperior years diguty. and experience; his great reputation in arms ; and it was farther urged in his favour, that the impetuofity of the French cavalry, added to the firmnets of the German infantry, would prove irrefifible, and not only be fufficient, under a warlike emperor, to fet limits to the ambition of Selim, but to break entirely the Ottoman power, and prevent it from. ever becoming dangerous again to Germany.

Both claims were plaufible. The dominions of Fran.

Spaim. cis were lefs extenfive, but more united than thofe of Charles. His fubjects were numerous, active, brave, lovers of glory, and lovers of their king. Thefe were ftrong arguments in favour of his power, fo neceffary at this' juncture : but he had no natural intereft in the Germanic body; and the electors, hearing fo much of military force on each fide, became more alarmed for their own privileges than the conmon fafety. They determined to reject both candidates, and offered the imperial crown to Frederic, furnamed the Wife, duke of Saxony. But he, undazzled by the fplendour of an object courted with fo much eagernefs by two mighty monarchs, rejected it with a magnanimity no lefs fingular than great.
" In times of tranquillity (faid Frederic), we wifh for an emperor who has no power to invade our liber. ties; times of danger demand one who is able to fecure our fafety. The Turkifh armies, led by a warlike and victorious monarch, are now affembling: they are ready to pour in upon Germany with a violence unknown in former ages. New conjunctures call for new expedients. The imperial fceptre inuft be committed to fome hand more powerful than mine or that of any other German prince. We poffefs neither dominions, nor revenues, nor authority, which enable us to encounter fuch a formidable enemy, Recourfe muft be had, in this exigency , to one of the rival monarchs. Each of them can bring into the field forces fufficient for our defence. But as the king of Spain is of German extraction, as he is a member and prince of the empire by the territories which defcend to him from his grandfather, and as his dominions ftretch along that frontier which lies moft expofed to the enemy, his claim, in my opinion, is preferable to that of a flranger to our language, to our blood, and to our country." Charles was elected in confequence of this fpeech in the year 1520 .
The two candidates had hitherio conducted their ri--valfhip with emulation, but without enmity. They had even mingled in their competition many expreffions of friendflip and regard. Francis in particular declared with his ufual vivacity, that his brother Charles and he were fairly and openly fuitors to the fame miftrefs: "The molt affiduous and fortunate (added he) will win her; and the other muft reft contented." But the preference was no fooner given to his rival, than Francis difcovered all the paffions natural to difappointed ambition. He could not fupprefs his chagrin and indignation at being baulked in his favourite purfuit, and rejected, in the face of all Europe, for a youth yet un-
speech of Frederic duke of Saxory favour of pompt ; and from this jealoufy, as much as from oppofition of interefts, arofe that emulation between thofe two great monarchs which involved them in almolt perpetual hoftilities, and kept their whole age in movement.

Charles and Francis had many interfering claims in Italy; and the latter thought himfelf bound in honour to reftore the king of Navarre to his dominions; unjuftly
Both court ane by the fricndfhip of Hen-
ry VIII. of ry Vilt. of England.
be his intereft to keep the balance even between the contending powers, and to reftrain both, by not joining entirely with either; but he was feldom able to reduce his ideas to practice. Vanity and refentment were the great fprings of all his undertakings; and his neighbours, by touching thefe, found an eafy way to draw him into their meafures, and force him upon many rafh and inconfiderate enterprifes,

All the impolitic fteps in Henry's government muft not, however, be imputed to himfelf; many of them were occafioned by the ambition and avarice of his prime minifter and favourite cardinal Wolley. This man, who, by his talents and accomplifhments, had rifen from one of the lowelt conditions in life to the higheft employments both in church and ftate, enjoyed a greater degree of power and dignity than any Englifh fubject ever poffeffed, and governed the haughty, prefumptt:ous, and untractable fpirit of Henry, with abfolute authority. Francis was equally well acquainted vith the character of Henry and of his minifter. He had fuccefsfully flattered Wolfey's pride, by honouring him with particular marks of his confidence, and beftowing upon him the appellation of Father, Tutor, and Governor; and he had obtained the reftitution of 'Iournay, by adding a penfion to thofe refpectful titles. He now folicited an interview with the king of England near Calais; in hopes of being able, by familiar converfation, to An intertified the cardinal's vanity, by affording him an oppor jeqed betunity of difplaying his magnificence in the prefence of tween two courts, and of difcovering to the two nations his in-Hencry and Hluence over their monarchs. Charles dieaded the ef. fects of this projected interview between two gallant princes, whofe hearts were no lefs fufceptible of friendfhip than their manners were of infpiring it. Finding it impoffible, however, to prevent a vifit, in which the vanity of all parties was fo much concerned, he endeavoured to defeat its purpofe, and to pre-occupy the favour of the Englifh monarch, and of his miniter, by an act of complaifance ftill more flattering and more uncommon. Relying wholly upon Henry's generofity for his fafety, he landed at Dover, in his way from Spain to the Low Countries. The king of England, who was on his way to France, charned with fuch an in. flance of confidence, haftened to receive his royal gueft; and Charles, during his Nort ftay, had the addrefs not only to give Henry favourable inpreffions of his character and intentions, but to detach Wolfey entirely from the intereft of Francis. The tiara had attraeted the eye of that ambitions prelate; and as the emperor knew that the papacy was the fole point of elevation, beyond his prefent greatnefs, at which he could afpire, he made him an offer of his intereft on the firft vacancy.

The day of Charles's departure, Henry went over to Henry vifite Calais with his whole court, in order to meet Francis. Francis in Their interview was in an open plain between Guifnes Erance. and Ardres; where the two kings and their attendants difplayed their: magnificence with fuch emulation and profufe expence, as procured it the name of the Field of the Cloth of Gold. Here Henry erected a fpacious houfe of wood and canvas, framed in London, on which, under the figure of an Englifh archer, was the following motto: "He prevails whom I favour ;" alluding to his own political fituation, as holding in his
hands

Spain. hands the balance of power among the potentatcs of Europe. Feats of chivalry however, parties of gallantry, and fuch exercifes as were in that age reckoned manly or elegant, rather than ferious bufinefs, occupied the two courts during the timc that they continued together, whicll was 18 days.

After taking lcave of this fcene of diffipation, the king of England paid a vifit to the emperor and Margaretof Sávoy at Gravelines, and engaged them to go along with him to Calais; where the artful and politic Charles completed the impreffion which he had begun to make on Henry and his favourite, and effaced all the friendfhip to which the frank and generous nature of Francis had given birth. He renewed his affurances of affiting Wolley in obtaining the papacy; and he put him in prefent poffeffion of the revenues belonging to the fees of Badajox and Palencia in Spain. He flattered Henry's pride, by convincing him of his own importance, and of the jultnefs of the motto which he had chofen ; offering to fubmit to his fole arbitration any difference that might arife between him and Francis.
75 in. This important point being fecured, Charles repaired vefted with to Aix-la-Chapelle, where he was folennly invefted with the impe- the crown and fceptre of Charlemagne, in prefence of a rial crown 3t Aix-laChapelle. more fplendid and numerous affenbly than had appeared on any former inaugrration. About the fame time Solyman the Magnificent, one of the moft accomplifhed, enterprifing, and victorious of the riverkith princes, and a conitant and formidable rival to the emperor, afcended the Ottoman throne.

The firft act of Charles's adminiftration was to appoint a diet of the empire, to be held at Worms, in order to concert with the princes proper meafures for checking the progrefs of "thofe new and dangerous opinions which threatened to difturb the peace of Germany, and to overturn the religion of their anceftors." The opinions propagated by Luther and his followers were here meant. But all his efforts for that purpofe were infufficient, as is related under the articles Luther and Reformation,

In \(5^{21}\), the Spaniards, diffatisfied with the deparWar be- tweenfran-ture of their fovereign, whofe election to the empire cis and - they forefaw would interfere with the adminiftration of Charles. his own kingdom, and incerifed at the avarice of the Flemings, to whom the direction of public affairs had been committed fince the death of cardinal Ximenes, feveral grandees, in order to fhake off this oppreffion, entered into an affociation, to which they gave the name of the Sancla Functa; and the fword was appealed to as the means of redrefs. This feemed to Francis a favourable juncture for reinftating the family of John d'Albert in the kingdom of Navarre. Charles was at a diftance from that part of his dominions, and the a diftance from that part of his cominions, and the
troops ufually ftationed there had been called away to quell the commotions in Spain. A French army, un-
der Andrew de Foix, fpeedily conqueled Navarre; but quell the commotions in Spain. A French army, un-
der Andrew de Foix, fpeedily conqueled Navarre; but that young and inexperienced nobleman, pufhed on by military ardour, ventured to enter Caftile. The Spaniards, though eivided among themfelves, united againft a foreign enemy, routed his forces, took him prifoner, and recovered Navarre in a fhorter time than he had fpent in fubduing it.

Hoftilities thus begun in one quarter, between the sival monarchs, foon fpread to another. The king of France encouraged the-duke of Bouillon to make war
arainlt the emperor, and to invade Luxembourg. Charles, after humbling the duke, attempted to enter France; but was repelled and wortted before Mezieres by the famons chevalier Bayard, diftinguifhed anong his cotemporaries by the appellation of The Knight without fear and ruithout reproach; and who united the talents of a great general to the punctilious honour and romantic gallantry of the heroes of chivalry: Francis broke inte the Low Countries, where, by an excefs of caution, an error not natural to him, he loft an opportunity of cutting off the whole imperial army; and, what was of fijl more confequerice, he difgufted the conftable Bourbon, by giving the command of the van to the duke of Alençon.

During thefe operations in the field, an unfuccefsful congrefs was held at Calais, under the mediation of Henry VIII. It ferved only to exafperate the parties which it was intended to reconcile. A league was. foon after concluded, by the intrigues of Woliey, between the pope, Henry, and Charles, againft France. Leo had already entered into a feparate league with the emperor, and the French were faft lofing ground in: Italy.

I'he infolence and exactions of Marefial de Lautrec, governor of Milan, had totally alienated the affections of the Milanefe from France. They refolved to expel the troops of that nation, and put themfelves under the government of Franeis Sforza, brother to Maximilian their late duke. In this refolution, they were encouraged by the pope, who excommunicated Lautrec, and took into his pay a confiderable body of Swifs. The Rapid conpapal army; commanded by Profper Colonna, an expe-Charles. rienced general, was joined by fupplies from Germany and Naples; while Lautrec, meglected by his court, and deferted by the Swifs in its pay, was unable to make liead againft the enemy. The city of Milan was betrayed by the inhabitants to the confederates; Parma and Placentia were united to the ecclefiaftical fate; and of their conquefts in Lombardy, only the town of Cremona, the caftle of Milan, and a few inconfiderable forts, remained in the hands of the French.

Leo X. received the accounts of this rapid fuccels with fuch tranfports of joy, as are faid to have brought on a fever, which occafioned his death. The fpirit of the confederacy was broken, and its operations fufpended by this accident. The Swifs were recalled; fome other mercenaries difbanded for want of pay; and only. the Spaniards, and a few Germans in the emperor's fervice, remained to defend the duchy of Milan. Buti Lautrec, who with the remnant of his army had taken fhelter in the Venetian territories, deftitute both of mens and money, was unable to improve this favourable opportunity as lie wifhed. All his efforts were rendered ineffectual by the vigilance and ability of Colonna and: his affociates.

Meantime much difcord prevailed in the conclave. Wolfey's name, notwithftanding all the emperor's magnificent promifes, was fearcely mentioned there. Julio de Medici, Leo's ncphew, thought himfelf fure of theelection; when, by an unexpected turn of fortune, cardinal Adrian of Utrecht, Charles's preceptor, who. at that time governed Spain in the emperor's name, was unanimoully raifed to the papacy, to the aftonifhment of all Europe and the great difguft of the Ita.. lians.

Charles vi-
fits England

80
Rhodes ta.
ken by So iyman.

Francis, roufed by the rifing confequence of his rival, refolved to exert himfelf with frefh vigour, in order to wreft from him his late conquefts in Lombardy. I ant trec received a fupply of money, and a reinfercement of 10,000 Swifs. With this reinforcement he was enabled once more to act offenfively, and even to advance within a few miles of the city of Milan; when money again failing him, and the Swifs growing mutinous, he was obliged to attack the imperialifts in their camp at Bi cocca, where he was repulfed with great flaughter, having loft his bravelt officers and beft troops. Such of the Swifs as furvived fet out inmediately for their own country; and Lautrec, defpairing of being able to keep the field, retired into France. Genot, which fill remained fubject to Francis, and made it eafy to execute any fcheme for the recovery of Milan, was foon after taken by Colonna: the authority of the emperor and his faction was everywhere eftablifhed in Italy. The citadel of Cremona was the fole fortrefs which remained in the hands of the French.

The affiction of Francis for fuch a fucceffion of mif: fortunes was augmented by the unexpected arrival of an Englifh herald, who in the name of his fovereign declared war againt France. The courage of this excellent prince, however, did not forfake him ; though his treafury was exhaufted by expenfive pleafures, no lefs than by hoftile enterprifes, he affembled a confiderable army, and put his kingdom in a pofture of defence for refifting this new enemy, without abandoning any of the fchemes which he was forming againft the emperor. He was furprifed, but not alarmed, at fuch a denunciation.
Meanwhile Charles, willing to draw as much advantage as poflible from fo powerful an ally, paid a fecond vifit to the court of England in his way to Spain, where his prefence was become neceffary. His fuccefs exceeded his moft fanguine expectations. He not only gained the entire friendfhip of Henry, who pubiicly ratified the treaty of Bruges; but difarmed the refentment of Wolfey, by affuring him of the papacy on A. drian's death ; an event feemingly not diftant, by reafon of his age and infirmities. In confequence of thefe negociations an Englifh army invaded France, under the command of the earl of Surrey; who, at the end of the campaign, was obliged to retire, with his forces greatly reduced, without being able to make himfelf mafter of one place within the French frontier. Charles was more fortunate in Spain : he foon quelled the tumults which had there arifen in his abfence.
While the Chriftian princes were thus wafting each other's ftrength, Solyman the Magnificent entered Hun-1 gary, and made himfelf mafter of Belgrade, reckoned the chief barrier of that kingdom againft the T'urkifh power. Encouraged by this fuccefs, he turned his victorious arms againft the ifland of Rhodes, at that time the feat of the knights of St John of Jerufalem; and though every prince in that age acknowledged Rhodes to be the great bulwark of Chriftendom in the ea?, fo violent was their animofity againf each other, that they fuffered Solyman without difturbance to carry on his, operations againft that city and ifland. Line Adam, the grandmaiter, made a gallant defence; but, after incredible efforts of courage, patience, そnd military conduct, during a fiege of fix months, he was obliged to furrender the place, having obtained an honourable ca-

\section*{32. ] S. P A}
pitulation from the fultan, who admired and refpeiteck his heroic qualities (fee Rhodes and Malta). Charles and Francis were equally afhamed of having occafioned fuch a lofs to Cliriftendom by their contelts; and the emperor, by way of reparation, granted to the knights of St John the fmall infand of Malta, where they fixed their refidence, and continued long to, retain their an. cient fpirit, though much diminifhed in power and fplen-
dour. dour.
Adrian VI. though the creature of the emperor, and devoted to his intereft, endeavoured to afiume the impartiality which became the common father of Chritten. dom, and laboured to reconcile the contending princes, that they might unite in a league agrainft Solyman, whole conqueft of Rhodes rendered him more formidable than ever to Europe. The Italian flates were ino lefs defirous of peace than the pope: and fo much regard was paid by the hootile powers to the exhortations of his holinefs, and to a bull which he iffued, requiring all Chiltian princes to confent to a truce for three, years, that the imperial, the French, and the Englifh ambaffadors at Rome, were empowered to treat of that matter ; but while they wafted their time in fruitlefs. negociations, their mafters were continuing their pieparations for war; and other negociations foon took place. The, confederacy againit France becane more A tormidable than ever.

The Venetians, who had hitherto adhered to the againft French intereft, formed engagements with the emperor for fecuring Francis Sforza in the poffeffion of the duchy of Milan; and the pope, from a perfuafion that the ambition of the French monarch was the only obftacle to peace, acceded to the fame alliance. The Florentiues, the dukes of Ferrara and Mantua, and all the Italian powers, followed this example. Francis was, left without a fingle ally, to refift the efforts of a multitnde of enemies, whofe armies every where threatened, and whofe territories encompaffed his dominions. The emperor in perfon menaced France with an invafion on the fide of Guienne ; the forces of England and the Netherlands hovered over Picardy, and a numerous body of Germans was preparing to ravage Burgundy.

The dread of fo many and fuch powerful adverfaries; it was thought, would have obliged Francis to keep wholly on the delenfive, or at leaft have prevented him from entertaining any thoughts of marching int Italy. But before his enemies were able to trike a blow, Francis had affembled a great army, with which he hoped to difconcert all the emperor's fchemes, by marching it in perfon into Italy : and this bold meafure, the Francis more formidable becaufe unexpected, could fearcely have marches too failed of the defired effect, had it been immediately car-wards Italy, ried into execution.' But the difcovery of a domeftic but is obliconfpiracy, which threatened the deftruction of his turn by a kingdom, obliged Francis to ftop fhort at Lyons. ... domeftic * Charles duke of Bourbon, lord high conftable of confiracy, France, was a prince of the mof flining merit : his great talents equally fitted him tor the council or the field, while his eminent fervices, to the crown intitled him to its firf favour. : But unlaappily Louifa duchefs of. Angouleme, the king's mother, had contracted a violent averfion againft the houfe of Bourbon, and had taught her fon, over whom fhe had acquired an abfolute afcendant, to view all the conftable's actions; with a jealous eye. After repeated affionts he retired from court,

\section*{S P A [ 633 ] S P A}
and began to liften to the advanees of the emperor's miniters. Meantime the duchels of Bourbon died; and as the conftable was no lefs amiable than accomplifhed, she duchefs of Angouleme, ftill fufceptible of the tender paffions, formed the fcheme of marrying him. But Bourbon, who might have expected every thing to which an ambitious mind can afpire, from the doating fondnefs of a woman who governed her fon and the kingdom, incapable of imitating Lonifa in her fudden tranfition from hate to love, or of meanly counterfeiting a paffion for one who had fo long purfued bim with unprovoked malice, rejected the match with difdain, and turned the propofal into ridicule. At once defpifed and infulted by the man whom love only could have made her ceafe to perfecute, Louifa was filled with all the rage of difappoisted woman ; fhe refolved to ruin, fince fhe could not marry, Bourbon, For this purpofe fhe commenced an iniquitous fuit againft him ; and by the chicanery of chancellor du Prat, the conftable was ftripped of his whole family-eftate. Driven to defpair by fo many injuries, he entered into a fecret correfpon dence with the emperor and the kino of Englarid ; and he propofed, as foon as Francis fhould have croffed the Alps, to raife an infurrection among his numerous vaf. fals, and introduce foreign enemies into the heart of France.

Happily Francis got intimation of this confpiracy before he left the kingdom; but not being fufficiently convinced of the Conftable's guilt, he fuffered fo dangerous a foe to efcape; and Bourbon entering into the emperor's fervice, employed all the force of his enterprifing genius; and his great talents for war, to the prejudice of his prince and his native country.

In confequence of the difcovery of this plot, and the efcape of the powerful confpirator, Francis relinquifhed his intention of leading his army in perfon into Italy. He was ignorant how far the infection had fpread among his fubjects, and afraid that his ablence might encourage them to make fome defperate attempt in favour of a man fo much beloved. He did not, however, sabandon his defign on the Milancfe, but fent forward an army of 30,000 men, under the command of admi ral Bonnivet. Colonna, who was entrufted with the defence of that duchy, was in no condition to refift fuch a force; and the city of Milan, on which the whole territory depends, muft have fallen into the hands of the French, had not Bonnivet, who poffeffed none of the talents of a general, wafted his time in frivolous enterprifes, till the inhabitants recovered from their confternation. The imperial army was reinforced. Colonna died; and Lannoy, viceroy of Naples, fucceeded him in the command : but the chief direction of military operations was committed to Beurbon and the marquis de Pefcara, the greateft generals of their age. Bonnivet, deftitute of troops to oppofe this new army, and ftill more of the talents which could render him a match for its leaders, after various movements
84 and encounters, was reduced to the neceffity of attemptperia retreat into France. He was followed by the immous chevalier Bayard was killed.
The emperor and his allits were lefs fuccefsful in their attempts upon France. They were baffled in every quarter: and Francis; though ftripped of his Italian dominions, might ftill have enjoyed in fafety Vor. XVII. Part II.
the glory of having defended his native kingdom araint one half of Europc, and have bid defance to all his enemies; but underftanding that the king of England, difcouraged by his former fruitlefs enterprifes, and dif. 85 gufted with the emperor, was making no preparations Francis defor any attempt on Picardy, his ancient ardour feized termines him for the conqueft of Milan, and he determined, not- \({ }^{\text {to enter }}\) withftanding the advanced feafon, to march into Italy. faly in per-

The French army no fooner appeared in Piedmont, than the whole Milanefe was thrown into confternation. The capital opened its gates. The forces of the empe. ror and Sforza retired to Lodi : \(\}\) and had Francis been fo fortunate as to purfue them, they mutt have abandoned that poit, and been totally difperfed; but his evil genius led him to befiege Pavia, a town of conliderable ftrength, well garrifoned, and defended by An tonio de Leyva, one of the braveft officers in the Spanifh fervicc; before which place he was defeated and is defeated taken prifoner on the twenty-fourth day of February and taken 1524.

The captivity of Francis filled all Europe with alarm. Almoft the whole French army was cut off; Milan was immediately abandoned; and in a few weeks not a Frenchman was left in Italy. The power of the emperor, and ftill more his ambition, became an object of univerfal terror; and refolutions were everywhere taken to fet bounds to it. Meanwhile Francis, deeply innpreffed with a fenfe of his misfortune, wrote to his mother Louifa, whon he had left regent of the kingdom, the following fhort but expreffive letter : "All, Madam, is loft but honour." The fame courier that carried this letter, carried alfo difpatches to Charles; who Hypocritireceived the new's of the fignal and unexpected fuccefs cal conduct which had crowned his arms with the moft hypocritical moderation. He would not fuffer any public rejoicings to be made on account of it ; and faid, he only valued it, as it would prove the occafion of reftoring peace to Chriftendom. Louifa, however, did not truft to thofe appearances ; if fhe cepuld not preferve what was yct left, the dctermined at leaft that nothing fhould be loft through her negligence or weaknefs. Inftead of giving herfelf up to fuch lamentations as were natural to a woman fo remarkable for maternal tendernefs, the difcovered all the forefight, and exerted all the activity, of a confummate politician. She took every poffible meafure for putting the kingdom in a pofture of defence, while fhe employed all her addrefs to appeafe the refentment and to gain the friendfhip of England ; and a ray of comfort from that quarter foon broke in upon the French affairs.

Though Henry VIII. had not entered into the war againft France from any concerted political views, he had always retained fome imperfect idea of that balance of power which it was neceffary to maintain between Charles and Francis; and the prefervation of which he boalted to be his peculiar office. By his alliance with the emperor, be hoped to recover fome part of thofe territories on the continent which had belonged to his anceftors; and therefore willingly contributed to give him the afcendency above his rival; but having never dreamt of any event fo decifive and fatal as the victory at Pavia, which feemed not only to have broken, but to have annihilated the power of Francis, he now became fenfible of his own danger, as well as that of all Europe, from the lofs of a proper counterpoife to the power of

Charles.

Charles. Inftead of taking advantage of the diftreffed condition of France, Heary therefore determined to affift her in her prefent calamities. Some difgufts alfo had taken place between him and Charles, and ftill more between Charles and Wolfey. The elevation of the cardinal of Medici to St Peter's chair, on the death of Adrian, under the name of Clement VII. had made the Englifh minifter fenfible of the infincerity of the emperor's promifes, while it extinguithed all his hopes of the papacy; and he refolved on revenge. Charles, too, had fo ill fupported the appearance of moderation which he affumed, when firft informed of his good fortune, that he had already changed his ufual Ryle to Henry ; and initead of writing to him with his own hand, and fubfcribing himfelf "your affectionate fon and coufin," he dictated his letters to a fecretary, and fimply fubfrribed himfelf "Charles." Infuenced by all thefe motives, together with the glory of raifing a fallen enemy, Henry liftened to the flattering fubmiffions of Loui\(\mathrm{f}_{\mathrm{a}}\); entered into a defenfive alliance with her as regent of France, and engaged to ufe his, beft offices in order to procure the deliverance of her fon from a fate of captivity.
Meanwhile Francis was rigoroufly confined ; and fevere conditions being propofed to him as the price of his liberty, he drew his darger, and, pointing it at his breaft, cried, "'Twere better that a king fhould die thus!" His hand was with-held : and flattering himfelf, when he grew cool, that fuch propofitions could not come directly from Charles, he defired that he might be removed to Spain, where the emperor then refided. His requeft was complied with; but he languifhed long before he obtained a fight of his conqueror. At laft he was favoured with a vifit ; and the emperor dreading a general combination againft him, or that Francis, as he threatened, might, in the obftinacy of his heart, refign his crown to the dauphin, agreed to abate fomewhat of his former demands. A treaty was accordingly concluded at Madrid; in confequence of which Francis obtained his liberty. The chief article in this treaty was, that Burgundy fhould be reftored to Charles as the rightful inheritance of his anceftors, and that Francis's two eldeft fors fhould be immediately delivered up as hoftages for the performance of the conditions ftipulated. The exchange of the captive monarch for his children was made on the borders between France and Spain. The moment that Francis entered his own dominions, he mounted a Turkifh horfe, and putting it to its fpeed, waved his hand, and cried aloud feveral times, "I am yet a king! I am yet a king!"
97

\section*{Refures to} execute the conditions of his releafe.

Francis never meant to execute the treaty of Madrid : he had even left a proteft in the liands of notaries before he frgned it, that his confent fhould be confidered as an involuntary deed, and be deemed null and void. Accordingly, as foon as he arrived in France, he affembled the ftates of Burgundy, who protefted againft the article relative to their province; and Francis coldly replied to the imperial ambaffadors, who urged the immediate execution of the treaty, that he would religionfly perform the articles relative to himfelf, but in thofe affecting the French monarchy; he mult be directed by the fenfe of the nation. He made the higheft acknowledgments to the king of England for his friendly interpofition, and offered to be entirely gruided by his counfels. Charles and his minifters faw
that they were over-reached in thofe very arts of nego. ciation in which they fo much excelled, while the Italian ftates obferved with pleafure, that Francis was refolved not to execute a treaty which they confidered as dangerous to the liberties of Europe. Clement abfolved him from the oath which he had taken at Madrid; and the kings of France and England, the Pope, the Swifs, the Venetians, the Florentines, and the duke of Milan, entered into an alliance, to which they gave the name of the Holy League, becaufe his Holinefs was at the head of it, in order to oblige the emperor to deliver up Francis's two fons on the payment of a reafonable ranfom, and to re-eftablifh Sforza in the quiet poffefion of the Milanefe.

In confequence of this league, the confederate army took the field, and Italy once more became the fcene of war. But Francis, who it was thought would have infufed fpirit and vigour into the whole body, had gone through fuch a fcene of diftrefs, that he was become diffident of himfelf, diftruftful of his fortune, and defirous of tranquillity. He flattered himfelf, that the dread alone of fuch a confederacy would induce Charles to liften to what was equitable, and therefore neglected to fend due reinforcements to his allies in Italy. Meantime the duke of Bourbon, who commanded the Imperialifts, had made himfelf mafter of the whole Milanefe, of which the emperor had promifed him the inveltiture; and his troops beginning to mutiny for want of pay, Rome \({ }^{22}\) he led them to Rome, and promifed to enrich them ken by with the fpoils of that city. He was as good as his imperial word; for though he himfelf was flain in planting a fcaling ladder againft the walls, his foldiers, rather enraged than difcouraged by his death, mounted to the affault with the utmoft ardour, animated by the greatnefs of the prize, and, entering the city fword in hand, plundered it for feveral days.

Never did Rome in any age fuffer fo many calami- And mo \({ }^{93}\) ties, not even from the Barbarians, by whom fhe was cruelly often fubdued, the Huns, Vandals, or Goths, as now plunder from the fubjects of a Chriftian and Catholic monarch. Whatever was refpectable in modefty, or facred in religion, feemed only the more to provoke the rage of the foldiery. Virgins fuffered violation in the arms of their parents, and upon thofe altars to which they had fled for fafety. Venerable prelates, after enduring every indignity and every torture, were thrown into dungeons, and menaced with the moft cruel death, in order to make them reveal their fecret treafures. Clement himfelf, who had neglected to make his efcape in time, was taken prifoner, and found that the facrednefs of his character could neither procure him liberty nor refpect. He was confined till he fhould pay an enormous ranfom impofed by the victorious army, and furrender to the The \({ }^{94}\) emperor all the places of ftrength belonging to the church.

Charles received the news of this extraordinary event shamef with equal furprife and pleafure; but in order to con-hypocri ceal his joy from his. Spanifh fubjects, who were filled Charles with horror at the infult offered to the fovereign pontiff, and to leffen the indignation of the reft of Europe, he expreffed the moit profound forrow for the fuccefs of his arms. He put himfelf and his court into mourning; ftopped the rejoicings for the birth of his fon Philip, and ordered prayers to be put up in all the churches of Spain for the recovery of the pope's liberty,

\section*{S P A [ 635 ] S P A}
which he could immediately have procured by a letter to his generals.

The concern expreffed by Henry and Francis for the calamity of their ally was more fincere. Alarmed at the progrefs of the imperial arms, they had, even before the taking of Rome, entered into a clofer alliance, and agreed to invade the Low Countries with a powerful army ; but no fooner did they hear of the Pope's captivity, than they changed, by a new treaty, the fcene of the projected war from the Netherlands to Italy, and refolved to take the moft vigorous meafures for reftoring him to liberty. Henry, however, contributed only money. A French army entered Italy, under the command of Marfhal Lautrec ; Clement obtained his freedom ; and war was for a time carried on by the confederates with fuccefs; but the death of Lautrec, and the revolt of Andrew Doria, a Genoefe admiral in the fervice of France, entirely changed the face of affairs. The French army was utterly ruined; and Francis, difcouraged and almoft exhautted by fo many unfuccefsful enterprifes, began to think of peace, and of obtaining the releafe of his fons by conceffions, not by the terror of his arms.

At the fame time Charles, notwithftanding the advantages he had gained, had many reafons to wifh for an accommodation. Sultan Solyman having over-run Hungary, was ready to break in upon the Auftrian territories with the whole force of the Eaft; and the progrefs of the Reformation in Germany threatened the tranquillity of the empire. In confequence of this fituation of affairs, though pride made both parties conceal or diffemble their real fentiments, two ladies were permitted to reftore peace to Europe. Margaret of Auftria, Charles's aunt, and Louifa, Francis's mother, met in I 529 at Cambray, and fettled the terms of accommodation between the French king and the emperor. Francis agreed to pay two millions of crowns as the ranfom of his two fons, to refign the fovereignty of Flanders and Artois, and to forego all his Italian claims; and Charles ceafed to demand the reftitution of Burgundy.

All the fteps of this negociation had been communicated to the king of England ; and Henry was, on that occafion, fo generous to his friend and ally Francis, that he fent him an acquittal of near fix hundred thoufand crowns, in order to enable him to fulfil his agreement with Charles. But Francis's Italian confederates were lefs fatisfied with the treaty of Cambray. They werè almoft wholly abandoned to the will of the emperor; and feemed to have no other means of fecurity left but his equity and moderation. Of thefe, from his paft conduct, they had not formed the moft advantageous idea. But Charles's prefent circumitances, more efpecially in regard to the Turks, obliged him to behave with a generofity inconfiftent with his character. The Florentines alone, whom he reduced under the dominion of the family of Medici, had reafon to complain of his feverity. Sforza obtained the inveftiture of Milan and his pardon; and every other power experienced the lenity of the conqueror.

After having received the imperial crown from the hands of the Pope at Bologna, Charles proceeded on his journey to Germany, where his prefence was become highly neceffary; for although the conduct and valour of his brother Ferdinand, on whom he had conferred
the hereditary cominions of the houfe of Auftria, and Spain. who had been elected king of Hungary, had obliyed Solyman to retire with infamy and lofs, his return was to be feared, and the diforders of religion were daily in. creafing; an account of which, and of the emperor's tranfactions with the Proteftants, is given under the article Reformation.

Charles having exerted himfelf as much as he could againft the reformers, undertook his firft expedition againft the piratical ftates of Africa. Barbary, or that part of the African continent lying along the coaft of fate th the Mediterranean fea, was then nearly in the fame con. Barbary. dition which it is at prefent. Morocco, Algiers, and 'Iunis, were its principal ftates; and the two laft were nefts of pirates. Barbaroffa, a famois Corfair, had fucceeded his brother in the kingdom of Algiers, which he had formerly affitted him to ufurp. He regulated with much prudence the interior police of his kingdom, carried on his piracies with great vigour, and extended his conquefts on the continent of Africa; but perceiving that the natives fubmitted to his government with impatience, and fearing that his continual depredations would one day draw upon him a general combination of the Chriftian powers, he put his dominions under the protection of the grand feignior. Solyman, flattered by fuch an act of fubmiffion, and charmed with the boldnefs of the man, offered him the command of the Turkifh fleet. Proud of this diftinction, Barbaroffa repaired to Conftantinople, and made ufe of his influence with the fultan to extend his own dominion. Partly by force, partly by treachery, he ufurped the kingdom of Tunis; and being now poffeffed of greater power, he carried on his depredations againft the Chriftian ftates with more deftructive violence than ever.

Daily complaints of the piracies and ravages committed by the galleys of Barbaroffa were brought to the emperor by his fubjects, both in Spain and Italy ; and all Chriftendom feemed to look up to him, as its greateft and moft fortunate prince, for relief from this new and odious fpecies of oppreffion. At the fame time Muley-Hafcen, the exiled king of Tunis, finding none of the African princes able or willing to fupport him in recovering his throne, applied to Charles tor affiftance againft the ufurper. Equally defirous of delivering his donainions from the dangerous neighbourhood of Barbarofla, of appearing as the protector of an unfortunate prince, and of acquiring the glory annexed in that age to every expedition againf the Mahometans, the emperor readily concluded a treaty with Muley Hafcen, and fet fail for Tunis with a formidable armament. The Goletta, a fea port town, fortified with 300 pieces of cannon, was taken, together with all Barbaroffa's fleet : he was defeated in a pitched battle, and 10,000 Chrittian flaves, having knocked off their fetters, and Tunis tamade themfelves mafters of the citadel, Tunis was pre ken and paring. to furrender. But while Charles was deliberating the inhabion the conditions, his troops fearing that they would a tscruelly be deprived of the booty which they had expected, broke fuddenly iuto the tawn, and pillaged and maffacred without diftinction. 'Thirty thoufand perfons perifhed by the fword, and 10,000 were made prifo. ners. The fceptre was reftored to Muley Hafcen, on condition that he frould acknowledge himfelf a vaffal of the crown of Spain, put into the emperor's hands all the fortified Sea-ports in the kingdom of-Tunis, and

\section*{S P A [636] S P A}
pay annually 12,000 crowns for the fubfitence of the Spanifh garrifon in the Goletta. Thefe points being fettled, and 22,000 Chrittian flaves freed from bondage either by aruss or by treaty, Charles returned to Europe, where his prefence was become neceffary; while Barbaroffa, who had retired to Bona, recovered new firength, and again became the tyrant of the ocean.

The king of France took advantage of the emperor's abfence to revive his pretenfions in Italy. The treaty of Cambray had covered up but not extinguifhed the flames of difcord. Francis in particular, who waited only for a favourable opportunity of recovering the territories and reputation which he had loft, continued to negotiate againft his rival with different courts. But all his negotiations were difconcerted by unforefeen accidents. The deatl of Clement VII. (whom he had gained by marrying his fon the duke of Orleans, afterwards Henry II. to Catharine of Medici, the niece of that pontiff), deprived him of all the fupport which he hoped to receive from the court of Rome. The king of England, occupied with domeftic care; and projects, declined engaging in the affairs of the continent; and the Proteftant princes, affociated by the league of Smalkalde, to whom Francis had alfo applied, and who feemed difpofed at firft to liften to him, filled with indignation and relentment at the cruelty with which fome of their reformed brethren had been treated in France, refufed to have any connection with the enemy of their religion.

Francis was neither cruel nor bigotted: he was too indolent to concern himfelf about religious difputes; but his principles becoming fufpected, at a time when the emperor was gaining immortal glory by his expedition againft the Infidels, he found it neceffary to vindicate himfelf by fome extraordinary demonftration of reverence for the eftablifhed faith. 'The indifcreet zeal of fome Proteftant converts furnifhed him with the occafion. They had affixed to the gates of the Louvre and other public places papers containing indecent reflec. tions on the rites of the Romifh church. Six of the perfons concerned in this rath acion were fuized; and the king, pretending to be ftruck with horror at their blafphemies, appointed a folemn proceffion, in order to avert the wrath of heaven. The holy facrament was carried through the city of Paris in great pomp: Francis walked uncovered before it, bearing a torch in his hand ; the princes of the blood fupported the canopy over it ; the nobles walked beluind. In prefence of this numerous affembly, the king declared, that if one of his hands were infected with herefy, he would cut it off with the other; " and I would facrifice (added he) even my own children, if found guilty of that crime." As an awful proof of his fincerity, the fix unhappy perfons who had been feized were publicly burnt, before the proceffion was finifhed, and in the moft cruel manner. They were fixed upon a machine which defcended into the flames, and retired alternately, until they expired. - No wonder that the Proteftant princes were incenfed at fuch barbarity !

But Francis, though unfupported by any ally, commanded his army to advance towards the frontiers of Italy, under pretence of chaftifing the duke of Milan for a breach of the law of nations, in putting to death his ambalfidor. 'The operazions of war, however, foon took a new direction. Inftead of marching directly to
the Milanefe, Francis commenced hottilities againft the duke of Savoy, with whom he had caufe to be diffatisfied, and on whom he had fome claims; and before the end of the campaign, that feeble prince faw himfelf ftripped of all his dominions, except the province of Piedmont. To complete his misforcunes, the city of Geneva, the fovereignty of which he claimed, and where Geneva the reformed opinions had already got footing, threw the yoke off his yoke; and its revolt drew along with it the lofs \({ }_{\text {Savoy. }}^{\text {the duk }}\) of the adjacent territory. Geneva was then an impe. rial city, and has ever fince remained entirely free.

In this extremity the duke of Savoy faw no refource but in the emperor's protection ; and as his misfortunes were chiefly occafioned by his attachment to the imperial intereft, he had a title to immediate affiftance. But Charles, who was juft returned from his African expe. dition, was not able to lend him the neceffary fupport. His treafury was entirely drained, and he was obliged to difband his army till he could raife new fupplies: Mean time the death of Sforza duke of Milan entirely changed the nature of the war, and afforded the emperor full leifure to prepare for action. The French mo. narch's pretext for taking up arms was at once cut off; but as the duke died without iffue, all Francis's rights to the duchy of Milan, which he had yielded only to Sforza and his defcendants, returned to him in full force. He inftantly renewed his claim to it ; and if he had ordered his army iminediately to advance, he might have made himfelf mafter of it. But he unfortunately wafted his time in fruitlefs negotiations, while his more politic rival took poffeffion of the duchy as a vacant fief of the empire; and though Charles feemed ftill to admit the equity of Francis's claim, he delayed granting the inveftiture under various pretences, and was fecretly taking every poffible meafure to prevent him from regaining footing in Italy.

During the time gained in this manner Charles had recruited his finances, and of courfe his armies; and finding himfelf in a condition for war, he at laft threw off the mafk under which he had fo long concealed his defigns from the court of France. Entering Rome with great pomp, he pronounced before the pope and cardinals, aflembled in full confiftory, a violent invective againft Francis, by way of reply to his propofitions concerning the inveftiture of Milan. Yet Francis, by an weakne unaccountable fatality, continued to negotiate, as if it of Franci had been till poffible to terminate their differences in an amicable manner; and Charles, finding him fo eager to run into the fnare, favoured the deception, and, by feeming to liften to his propofals, gained yet more time for the execution of his ambitious projects.

If misfortunes had rendered Francis too diffident, Charles fuccefs had made Charles too fanguine. He prefumed rempts to on nothirg lefs than the fubverfion of the French monarchy ; nay, he confidered it as an infallible event. Having chafed the forces of his rival out of Piednont and Savoy, he pufhed forward at the head of 50,000 men, contrary to the advice of his moit experienced minitters and generals, to invade the fouthern provinces of France; while other two armies were ordered to errter it, the one on the fide of Picardy, the other on the fide of Champagne. He thought it impoffible that Francis conld refift fo many unexpected attacks on fuch different quarters ; but he found himfelf miftaken.

The French monarch fixed upon the moll effectual

\section*{S P A [. 637 ] S P A}
plan for defeating the invafion of a powerful enemy ; and he prudently perfevered in following it, though contrary to his own natural temper and to the genius of his people. He determined to remain altogether upon the defenfive, and to deprive the enemy of fubfiftence by laying wafte the country before them. The execution of this plan was committed to the marefehal Montmorency its author, a man happily fitted for fuch a truft by the inflexible feverity of his difpofition. He made choice of a ttrong camp, under the walls of Avignon, at the confluence of the Rhone and Durance, where he affémbled a confiderable army; while the king, with another body of troops, encamped at Valence, higher up the Rhone. Marfeilles and Arles were the only towns he thought it neceffary to defend; and each of thefe he furnifhed with a numerous garrifon of his bett troops. The inhabitants of the other towns were compelled to abandon their habitations: the fortifications of fuch places as might have afforded thelter to the enemy were thrown down ; corn, forage, and provifions of every kind, were carried off or deftroyed ; the mills and ovens were ruined, and the wells filled up or rendered ufelefs.

This devaftation extended from the Alps to Marfeilles, and from the fea to the confines of Dauphiny ; fo that the emperor, when he arrived with the van of his army on the confines of Provence, inftead of that rich and populous country which he expected to enter, beheld nothing but one vaft and defert folitude. He did not, however, defpair of fuccefs, though he faw that he would have many difficulties to encounter; and as an encouragement to his officers, he made them liberal promifes of lands and honours in France. But all the land which any of them obtained was a grave, and their mafter loft much honour by this rafh and piefumptuous enterprize. After unfuccefsfully invefting Marfeilles and Arles, after attempting in vain to draw Montmorency from his camp at Avignon, and not dasing to attack it, Charles having fpent two inglorious months in Provence, and loft one half of his troops by difeafe or by famine, was under the neceffity of ordering a retreat ; and though he was fome time in motion before the enemy fufpected his intention, it was conducted with fo much precipitation and diforder, as to deferve the name of a flight, fince the light troops of France turned it into a perfect rout. The invafion of Picardy was not more fuccefsful: the imperial forces were obliged to rctire without effecting any conqueft of im. portance.
Charles had no fooner conducted the fhattered remains of his army to the frontiers of Milan, than he fet out for Genoa; and unwilling to expofe himfelf to the fcorn of the Italians after fuch à reverfe of fortune, he embarked directly for Spain.

Meanwhile Francis gave himfelf up to that vain refentment which had formerly difgraced the profperity of his rival. They had frequently, in the courfe of their quarrels, given each other the lie, and mutual challenges had been fent; which, though productive of no ferious confequences between the parties, had a powerful tendency to encourage the pernicions practice of duelling. Charles, in his invective pronounced at Rome, had publicly accufed Francis of perfidy and breach of faith; Francis now exceeded Charles in the indecency of his accufations. The Dauphin dying fuddenly, his death
was imputed to poifon: Montecuculi his cup-bearer was put to the rack; and that unhappy nobleman, in the agonies of torture, accufed the emperor's gencrals Gonzaga and de Leyva, of inftigating hin to the deteftable act. The emperor himfelf was fufpected; nay, this extorted confeffion, and fome obfcure hints, were confidered as inconteftable proofs of his guilt; though it was evident to all mankind, that neither Charles nor his generals could have any inducement to pcrpetrate fuch a crime, as Francis was ftill in the vigour of life himfelf, and had two fons befides the dauphin, grown up to a good age.

But the incenfed monarch's refentment did not ftop here. Francis was not fatisfied with cndeavouring to blacken the character of his rival by an ambiguous teftimony which led to the moft injurions fufpicions, and upon which the moft cruel conftructions had been pit; he was willing to add rebellion to murder. For this purpofe he went to the parliament of Paris; where being feated with the ufual folemnities, the advocate-general appeared, and accufed Charles of Autria (fo he affected to call the emperor) of having violated the treaty of Cambray, by which he was freed from the homage due to the crown of France for the counties of Artois and Flanders; adding, that this treaty being now void, he was ftill to be confidered as a vaffal of France, and confequently had been guilty of rebellion in taking arms againft his fovereign. 'the charge was fuftained, and Charles was fummoned to appear before Charles the parliament of Paris at a day fixed. The term ex-tamoned pired; and no perfon appcaring in the emperor's name, at Paris. the parliament gave judgment, that Charles of Auftria had forfeited, by rebellion and contumacy, the counties of Flanders and Artois, and declared thefe fiefs reunited to the crown of France.

Francis, foon after this vain difplay of his animofity, marched into the Low Countries, as if he had intended to execute the fontence pronounced by his parliament ; -but a fufpenfion of arms took place, through the interpefition of the queens of France and Hungary, before any thing of confequence was effected: and this ceffa. tion of hoftilities was followed by a truce, concluded at Nice, through the mediation of the reigning pontiff Paul III. of the family of Farnefe, a man of a venerable character and pacific difpofition.

Each of thefe rival princes had flrong reafons to inicline them to pcace. The finances of both were exhaulted ; and the emperor, the moft powerful of the two, Francis was deeply impreffcd with the dread of the Turkifh leagucs arms, which Francis had drawn upon him by a league with the with Solyman. In confequence of this league, Barbaroffa with a great fleet appeared on the coaft of Naples; filled that kingdom with confternation; landed without refiftance ncar Taranto; obliged Caftro, a place of fome ftrengrth, to furrender; plundered the adjacent country ; and was taking mcafures for fecuring and extending his conquefts, when the unexpected arrival of Doria, the famous Genoele admiral, together with the pope's galleys and a fquadron of the Venctian fleet, made it prucient for him to retire. 'I he fultan's forces alfo invaded Hungary, where Mahmet the Turkifh general, after gaining feveral inferior advantages, defeated the Germans in a great battle at Effek on the Drave. Happily for Charles and Europe it was not in Francis's power aţ this juncture either to join the Turks or afo

femble an army ftrong enough to penetrate into the Milanefe. The emperor, however, was fenfible that he could not long refift the efforts of two fuch powerful confederates, nor expect that the fame fortunate circumftances would concur a fecond time in his favour; he thercfore thought it neceffary, both for his fafety and reputation, to give his confent to a truce: and Francis chofe rather to run the rifk of difobliging his new ally the fultan, than to draw on his head the indignation, and perhaps the arms, of all Chriftendom, by obftinately obftructing the re-eftablifhment of tranquillity, and contributing to the aggrandizement of the In. fidels.

Thefe confiderations inclined the contending monarchs to liften to the arguments of the holy father; but he found it impoffible to bring about a final accommodation between them, each inflexibly perfifting in afferting his own claims. Nor could he prevail on them to fee one another, though both came to the place of rendezvous: fo great was the remains of diftruft and rancour, or fuch the difficulty of adjufting the ceremonial! Yet, improbable as it may feem, a few days after figning the trucc, the emperor, in his paffage to Barcelona, being driven on the coaft of Provence, Francis invited him to come aflore; frankly vifited him on board his galley, and was received and entertained with the warmeft demonftrations of efteem and affection. Charles, with an equal degree of confidence, paid the king next day a' vifit at Aigues-mortes; where thefe two hoftile rivals and vindictive enemies, who had accufed each other of every kind of bafenefs, converfing together with all the cordiality of brothers, feemed to vie with each other in expreffions of refpect and friendfhip.
Befides the glory of having reftored tranquillity to Europe, the pope gained a point of much confequence to his family. He obtained for his grandfon, Margaret of Auftria, the emperor's natural daughter, formerly wife of Alexander de Medici, whom Charles had raifed to the fupreme power in Florence. Lorenzo de Medici, the kinfman and intimate companion of Alexander, had affaffinated him by one of the blackeft treafons recorded in hiftory. Under'pretence of having fecured him an affignation with a lady of the higheft rank and great beauty, he drew him into a fecret apartment of his houfe, and there ftabbed him as he lay carelefsly on a couch, expecting the embrace of the lovely fair, whom he had often folicited in vain. Lorenzo, how. ever, did not reap the fruits of his crime; for though fome of his countrymen extolled him as a third Brutus, and endeavoured to feize this occafion for recovering their liberties, the government of Florence paffed into the hands of Cofmo II. another kinfman of Alexander. Cofme was defirous of marrying the widow of his predeceflor ; but the emperor chofe rather to oblige the pope, by beftowing his daughter upon Octavio Farnefe, fon of the duke of Parma.

Charles had foon farther caufe to be fenfible of his obligations to the holy father for bringing about the treaty of Nice. His troops every where mutinied for want of pay, and the ability of his generals only could have prevented a total revolt. He had depended, as his chief refource for difcharging the arrears due to his foldiers, upon the fubfidies which he expected from his Cattilian fubjects. For this purpofe he affembled the

Cortes of Caftile at Toledo ; and having reprefented to them the great expence of kis military operations, he propofed to levy fuch fupplies as the prefent exigency of affairs demanded, by a general excife on commodities; but the Spaniards, who already felt themfelves oppreffed by a load of taxes unknown to their anceftors, and who had often complained that their country was drained of its wealth and inhabitants, in order to profecute quarrels in which they had no intereft, determined not to add voluntarily to their own burdens. The no. bles, in particular, inveighed with great vehemence againft the impofition propofed, as an encroachment on the saluable and diftinguifhing privilege of their order, that of being exempted from the payment of any tax. After employing arguments and promifes in vain, Charles difmiffed the affembly with indignation; and from that period neither the nobles nor the prelates have been called to the Cortes, on pretence that fuch as pay no part of the public taxes fhould not claim a vote in laying them on. Thefe affemblies have fince confifted merely of the procurators or reprefentatives of I cities, two from each; in all 36 members, who are abfolutely at the devotion of the crown.

The citizens of Ghent, ftill more bold, broke out not long after into open rebellion againft the emperor's government, on account of a tax which they judged contrary to their ancient privileges, and a decifion of the council of Mechlin in favour of the imperial authority. Enraged at an unjuft impofition, and rendered defperate on feeing their rights betrayed by that very court which was bound to protect them, they flew to arms, feized feveral of the emperor's officers, and drove fuch of the nobility as refided among them out of the city. Sen. fible, however, of their inability to fupport what their zeal had prompted them to undertake, and defirous of fecuring a protector againft the formidable forces with which they might expect foon to be attacked, they of. fered to acknowledge the king of France as their fovereign, to put him into immediate poffeffion of their city, and to affift him in recovering thofe provinces in the Netherlands which had anciently belonged to his crown. True policy directed Francis to comply with this propofal. The counties of Flanders and Artois were more valuable than the duchy of Milan, for which he had fo long contended; and their fituation in regard to France made it more eafy to conquer or to defend them. But Francis over-rated the Milanefe. He had lived in friendihip with the emperor ever fince their in. Extreme terview at Aigues-mortes, and Charles had premifed him of Franci the inveftiture of that duchy. Forgetting, therefore, all his paft injuries, and the deceitful promifes by which he had been fo often duped, the credulous, generous Francis, not only rejected the propofitions of the citizens of Ghent, but communicated to the emperor his whole negociation with the malecontents.
Judging of Charles's heart by his own, Francis hoped by this fecmingly difinterefted proceeding to obtain at once the inveltiture of Milan; and the emperor, well acquainted with the weaknefs of his rival, flattered him in this apprehenfion, for his own felfifh purpofes. His prefence being neceffary in the Netherlands, he demanded a paffage through France. It was immediately granted him ; and Charles, to whom every moment was precious, fet out, notwithftanding the remonftrances of his council and the fears of his Spanifh fubjects, with a

\section*{S P A} ies, and being now under no neceffity of continuing that fcene of falfehood and diffimulation with
which he had amufed the French monarch, Charles bewhich he had amufed the French monarch, Charles began gradually to throw afide the veil under which he had concealed his intentions with refpect to the Milanefe, and at laft peremptorily refufed to give up a territory of fuch value, or voluntarily to make fuch a liberal addition to the ftrength of an enemy by dimininhing his own power. He even denied that he had ever made any promife which could bind him to an action fo foolifh, and fo contrary to his own interef.

This tranfaction expofed the king of France to as much fcorn as it did the emperor to cenfure. The credulous fimplicity of Francis feeined to merit no other return, after experiencing fo often the duplicity and artifices of his rival. He remonftrated, however, and exclaimed as if this had been the firt circumitance in which the emperor had deceived him. The infult offered to his undertanding affected him even more fenfibly than the injury done to his interelt ; and he difcovered fuch refentment as made it obvious that he would feize on the firft opportunity of revenge, and that a new war would foon defolate the European continent. earnefly to appoint a conference between a felect number of divines of each party, in order to examine the points in difpute. For this purpofe a diet was affembled at Ratifon: and fuch a. conference, notwithftanding the oppofition of the pope, was held with great folemnity in the prefence of the emperor. But the divines chofen to manage the controverfy, though men of
fmall but fplendid train of roo perfons. He was met
on the frontiers of France by the dauphin and the duke of Orleans, who offered to go into Spain, and remain there as hoftages, till he hould reach his own dominions; but Charles replied, that the king"s honour was fufficient for his fafety, and profecuted his journey without any other fecurity. The king entertaired him with the utmoft magnificence at Paris, and the two young princes did not take leave of him till he entered the Low Countries ; yet he ftill found means to evade his promife, and Francis continued to believe hin fincere.

The citizens of Ghent, alarmed at the approach of the emperor, who was joined by three armies, fent ambaffadors to implore his mercy, and offered to throw open their gates. Charles only condefcended to reply, "That he would appear among them as a fovereign and a judge, with the fceptre and the fword." He accordingly entered the place of his nativity on the anniverfary of his birth; and inftead of that lenity which might have been expected, exhibited an awful example of his feverity. Twenty-fix of the principal citizens were put to death; a greater number were banifhed ; the city was declared ta have forfeited its privileges; a new fyftem of laws and political adminiftration was prefcribed; and a large fine was impofed on the inhabitants, in order to defray the expence of erecting a citadel, together with an annual tax for the fupport of a garrifon. They were not only defpoiled of their ancient immunities, but made to pay, like conquered people, for the means of perpetuating their own flavery.

Having thus re-eftablifhed his authority in the Low Countries, and being now under no neceffity of conti-- fituation of the emperor's affairs at this juncture made thefe extraordinary conceffions neceffary. He forefaw a rupture with France to be unavoidable, and he was alarmed at the rapid progrefs of the Turks in Hungary. A great revolution had happened in that kingdom. John Zapol Scrpus, by the affiftance of Solyman, had wrefted from the king. of the Romans a confiderable part of the country. John died, and left an infant fon. Ferdinand attempted to take advantage of the minority, in order to repoffefs himfelf of the whole kingdom; but his ambition was difappointed by the activity and addrefs of George Martinuzzi, bifhop of Waradin, who fhared the regency with the queen. Senfible that he was unatle to oppofe the king of the Romans in the field, Martinuzzi fatisfied himfelf with holding out the fortified towns, all of which he provided with every thing neceffary for defence; and at the fame time he fent ambaffadors to Solyman, befeeching him to extend towards the fon that imperial protection which had fo generoully maintained the father on his throne. Ferdinand ufed his utmoft endeavours to thwart this negotiation, and even meanly offered to hold the Hungarian crown on the fame ignominious condition by which John had held it, that of paying tribute to the Porte. But the fultan faw fuch advantages from ef. poufing the intereft of the young king, that he inftantly marched into Hungary ; and the Germans, having formed the fiege of Buda, were defeated with great flaughter before that city. Solyman, however, inftead of becoming the protector of the infant fovereign whom he had relieved, made ufe of this fuccefs to extend his own dominions: he fent the queen and her fon into Tranfilvania, which province he allotted them, and added Hungary to the Ottoman empire.

\section*{\(S\) P A}

Siain. Happily for the Proteftantz, Charles received intelli gence of this revolution foon after the diet at Ratifoon; and by the conceffions which he made them, he obrained fuch liberal fupplies, both of men and money, as left

123 Undertake 1 uncer little anxiety about the fecurity of Germany on unfucceffulex. cefful ex
pedition againt Al giers. Fe therefore haftened to join his fleet and army in Ita. ly, in onder to carry into execution a great and favourite enterprize which he had concerted againft Algiers: though it would certainly have been more confiftent with his dignity to have conducted the whole force of

124
War be-
tween
Francis an
Charies. the empire againft Solyman, the common enemy of Chriftendom, who was ready to enter his Auftrian dominions. But many reafons induced Charles to prefer the African expedition : he wanted ftrength, or at leaft money, to combat the Turks in fo diftant a country as Hungary; and the glory which he had formerly acquired in Barbary led him to hope for the like fuccefs, while the cries of his Spanifh fubjects roufed him to take vengeance on their ravagers. But the unfortunate event of this expedition has already been related under the article Algiers, \(1^{\circ}\) 14-20.
The lofs which the emperor fuffered in this calamitous expedition encouraged the king of France to begin hoftilities, on which he had been for fome time refolved; and an: action difhonourable to civil fociety furnifhed him with too good a pretext for taking arms. The marquis del Gualto, governor of the Milanefe, having got intelligence of the motions and deftination of two ambaffadors, Rincon and Fergofo, whom Francis had difpatched, the one to the Ottoman Porte, the other to the republic of Venice; knowing how much his mafter wifhed to difcover the intentions of the French monarch, and of what confequence it was to retard the execution of his meafures, he employed fome foldiers belonging to the garrifon of Pavia to lie in wait for thefe arnbaffadors as they failed down the Po, who murdered them and moft of their attendants, and feized their papers. Francis immediately demanded reparation for this barbarous outrage ; and as Charles endeavoured to put him off with an evafive anfwer, he appealed to all the courts of Europe, fecting forth the heinoufnefs of the injury, the iniquity of the emperor in difregarding his juft requeft, and the neceffity of vengeance. But Charles, who was a more profound negotiator, defeated in a great meafure the effects of thefe reprefentations: he fecured the fidelity of the Proteftant princes in Germany, by granting them new conceffions; and he engaged the king of England to efpoufe his caufe, under pretence of defending Europe againft the Infidels ; while Francis was only able to form an alliance with the kings of Denmark and Sweden (who for the firt time interefted themfelves in the quarrels of the more potent monarchs of the fouth), and to renew his treaty with Solyman, which drew on him the indignation of Chriftendom.

But the activity of Francis fupplied all the defects of his negotiation. Five armies were foon ready to take the field, under different generals, and with different deftinations. Nor was Charles wanting in his preparations. He and Henry a fecond time made an ideal divifion of the kingdom of France. But as the hoftilities which followed terminated in nothing decifive, and were diftinguifhed by no remarkable event, except the battle of Cerifoles (gained by count d'Enguien over the imperialits, and in which 10,000 of the emperor's beft
troops fell), at laft Francis and Charles mutually tired of harafling each other, concluded at Crefpy a treaty of peace, in which the king of England was not mentioned; and from being implacable enemies, became once more, to appearance, cordial friends, and even al-Crcfpy lies by the ties of blood.

The chief articles of this treaty were, that all the conquelts which either party had made fince the truce of Nice fhould be reftored; that the emperor fhould give in marriage to the duke of Orleans, either his own eldeft daughter, with the Low Countries, or the fecond daughter of his brother Ferdinand, with the inveftiture of the Milanefe ; that Francis fhould renounce all pretenfions to the kingdom of Naples, as well as to the fovereignty of Flanders and Artois, and Charles give up his claim to the duchy of Burgundy ; and that both fhould unite in making war againft the Turks.

The emperor was chiefly induced to grant conditions fo advantageous to France, by a defire of humbling the Proteftant princes in-Germany. With the papal jurifdiction, he forefaw they would endeavour to throw off the imperial authority ; and he determined to make his zeal for the former a pretence for enforcing and extending the latter. However, the death of the duke of Orleans before the confummation of his marriage, difentangled the emperor from the moft troublefome Aipulation in the treaty of Crefpy; and the French monarch, being fill engaged ir hoftilities with England, was unable to obtain any reparation for the lofs which he fuffered by this unforefeen event. Thefe hoftilities, like thofe between Charles and Francis, terminated in nothing decifive. Equally tired of a ftruggle attended with no glory or advantage to either, the contending princes concluded, at Campe, near Ardies, a treaty of peace; in which it was fipulated, that France fhould pay the arrears due by former treaties to England. But thefe arrears did not exceed one-third of the fums expended by Henry on his military operations; and Francis being in no condition to difcharge them, Boulogne (a chargeable pledge) was left in the hands of the Englifh as a fecurity for the debt.

In confequence of the emperor's refolution to humble the Proteftant princes, he concluded a difhonourable peace with the Porte, ftipulating that his brother Ferdinand fhould pay tribute for that part of Hungary which he ftill poffeffed; while the fultan erijoyed the imperial and unditurbed poffeffion of all the reft. At the fame time he entered into a league with pope Paul III. for the extirpation of herefy; but in reality with a view to opprefs the liberties of Germany. Here, however, his ambition met with a fevere check; for though he was fuccefsful at firft, he was obliged in 1552 to conclude a peace with the Proteftants on their own terms; as has been related under the article Re: FORMATION, \(\mathrm{n}^{0}\) 26-32.
By the peace concluded on this occafion the emperor Attempt 124 loft Metz, Toul, and Verdun, which had formed the to recov barrier of the empire on that quarter; and therefore fome of th foon after put himfelf at the head of an army, in order \({ }^{\text {province }}\) to recover thefe three bifhoprics. In order to conceal the dellination of his army, he gave out, that he intended to lead it into Hungary, to fecond Maurice in his operations againft the Infidels; and as that pretext failed him, when he began to advance towards the Rhine, he propágated a report that he was marching

\section*{S P A [ \(641 \quad\) S P A}
firft to claatife Albert of Brandenburgh, who had refufed to be included in the treaty of Paffau, and whofe cruel exactions in that part of Germany called loudly for redrefs.

The French, however, were not deceived by thefe arts. Henry immediately gueffed the true object of Charles's armament, and refolved to defend his conquefts with vigour. The defence of Metz, againft which it was fore. e the feen the whole weight of the war would be turned, was committed to Francis of Lorraine, duke of Guife, who poffeffed in an eminent degree all the qualities that render men great in military command. He repaired with joy to the dangerous ftation; and many of the French nobility, and eveli princes of the blood, eager to diftin. guifh themfelves under fuch a leader, entered Metz as volunteers. The city was of great extent, ill fortified, and the fuburbs large. For all thefe defeets the duke endeavoured to provide a remedy. He repaired the old fortifications with all poffible expedition, labouring with his own hands; the officers imitated his example; and the foldiers, thus encouraged, cheerfully fubmitted to the moft fevere toils; lie erected new works, and he levelled the fuburbs with the ground. At the fame time he filled the magazines with provifions and military ftores, compelled all ufelefs perfons to leave the place, and laid wafte the neighbouring country; yet fuch were his popular talents, aas well as his arts of acquiring an afcendant over the minds of men, that the citizens not only refrained from murmuring, but feconded him with no lefs ardour than the foldiers in all his operationsin the ruin of their eftates, and in the havoc of their public and private buildings.

Meanwhile the emperor continued his march towards Lorraine, at the head of \(60,000 \mathrm{men}\). On his approach Albert of B1andenburgh, whofe army did not exceed 20,000 , withdrew into that principality, as if he in rended to join the French king ; and Charles, notwithflanding the advanced feafon, it being towards the end of Octuber, laid fiege to Metz, contrary to the advice of his moft experienced efficers.
The attention of both the befiegers and the befieged was turned for fome time towards the motions of Albert, who fill hovered in the neighbourhood, undetersnined which fide to take, thoughl refolved to fell his fervice. Charles at laft came up to his price, and lie joined the imperial army. The emperor now flattered himfelf that nothing could refift his force; but he found himfelf deceived. After a fiege of almoft 60 days, during which he had attempted all that was thought poffible for art or valour to effect, and had loft upwards of 30,000 men by the inclemency of the weather, difeafes, or the fword of the enemy, he was obliged to abandon the euterprife.

When the French fallied out to attack the enemy's rear, the imperial camp was filled with the fick and wounded, with the dead and the dying. All the roads by which the arny retired were ftrewed with the fame miferable objeceis; who, having made an effort beyond their ftrength to efcape, and not being able to proceed, were left to perifl without affitance. Happily that, aad all the kiud offices which their friends had not the power to perform, they received from their enemies. The duke of Guife ordered them all to be taken care of, and fupplied with every neceffary'; he appointed Vor. XVII. Part IJ.
phyficians to attend, and direct what treatment was proper for the fick and wounded, and what refreflments for the feeble; and fuch as recovered he fent iome, under an efcort of foldiers, and with money to bear their charges. By thefe acts of humanity, lefs common in that age, the duke of Guife completed that heroic character which he had juftly acquired by his brave and fuccefsful defence of Metz.

The emperor's misfortunes were not confined to Germany. During his refidence at Villach, he had been obliged to borrow 200,000 crowns of Cofmo de Medici ; and fo low was his credit, that he was obliged to put Cofmo in poffeffion of the principality of Piombino as a fecurity for that inconfiderable fum; by which means he loft the footing he had hitherto maintained in Tufcany. Much about the fame time he loft Sienna. The citizens, who had long enjoyed a republican government, rofe againft the Spanifh garrifon, which they had admitted as a check upon the ryranny of the nobility, but which they found was meant to enflave them; forgetting their domeftic animofities, they recalled the cxiled nobles; they demolifhed the citadel, and put themfelves under the protection of France.

To thefe unfortunate events one ftill more fatal had almoft fucceeded. The fevere adminiftration of the viceroy of Naples had filled that kingdom with murmuring and diffatisfaction. The prince of Salerne, the head of the malecontente, fled to the court of France. The French monarch, after the example of his father, applied to the grand fignior; and Solyman, at that time highly incenfed againft the honfe of Auftria on account of the proceedings in Hungary, fent a powerful fleet into the Mediterrancan, under the command of the corfair Dragut, an officer trained up under Barbaroffa, and fcarce inferior to his mafter in courage, talents, or in good fortune. Dragut appeared on the coatt of Calabria at the time appointed; but not being joined by the French fleet according to concert, he returned to Conftantinople, after plundering and burning feveral places, and filling Naples with confternation.

Highly mortified by fo many difafters, Charles re-Is fucce 13 tired into the Low Countries; breathing vengeance ful in the againft France : and here the war was carried on with Low Courconfiderable vigour. Impatient to efface the ftain which his military reputation had received before Metz, Charles̃ laid fiege to Terouane; and the fortifications being in difrepair, that important place was carried by affault. Hefdin alfo was invefted, and carried in the fame manner. The king of France was too late in affembling his forces to afford relief to either of thefe places; and the emperor afterwards cautioufly avoided an engagement.
The imperial arms were lefs fuccefsful in Italy. The But not fo viceroy of Naples failed in au attempt to recover Siena; in other and the French not only eftablifhed themfelves more \({ }^{\text {places. }}\) firmly in Tufcany, but conquered part of the ifland of Corfica. Nor did the affairs of the hou\{f of Auftria go on better in Hungary during the courfe of this year. Ifabella and her fon appeared once more in Tranfylvania, at a time when the people were ready for revolt, in order to revenge the death of Martinuzzi, whofe lofs they had feverely felt. Some noblemen of eminence declared in favour of the young king ; and the bafhaw of Belgrade, by Solyman's order, efpoufing his caufe,

between
Philip of
Spain and
Mary of
England.
in oppofition to Ferdinand, Caltaldo, the Auftrian general, was obliged to abandon Traniylvania to Ifabella and the Turks.

In order to counterbalance thefe and other loffes, the emperor, in 1554 , concerted a marriage between his fon Philip and Mary of England, in hopes of adding that kingdom to his other dominions. Meanwhile the war between Henry and Charles was carried on with various fuccefs in the Low Countries, and in Italy much to the difadvantage of France. The French, under the command of Strozzi, were defeated in the battle of Mer. ciano; Sienna was reduced by Medicino, the Florentine general, after a fiege of ten months; and the gallant Sienefe were fubjected to the Spanifh yoke. Much about the fame time a plot was formed by the Francifcans, but happily difcovered before it could be carried into execution, to betray Metz to the Imperialifts. The father-guardian, and twenty other monks, received fentence of death on account of this confpiracy ; but the guardian, before the time appointed for his execution, was murdered by his incenfed accomplices, whom he haid feduced; and fix of the youngeft were pardoned.

While war thus raged in Italy and the Low Countries, Germany enjoyed fuch profound tranquillity, as afforded the diet full leifure to confirm and perfect the plan of religious pacification agreed upon at Paffau, and referred to the confideration of the next meeting of the Germanic body. During the negociation of this treaty, an event happened which aftonilhed all Enrope, and confounded the reafonings of the wifett politicians.

The emperor Charles V. though no more than 56 , an age when objects of ambition operate with full force on the mind, and are generally purfued with the greateft ardour, had for fome time formed the refolution of refigning his hereditary dominions to his fon Philip. He now determined to put it in execution. Various have been the opinions of hiftorians concerning a refolution fo fingular and unexpected; but the moft probable feem to be, the difappointments which Charles had met with in his ambitious hopes, and the daily decline of his health. He had early in life been attacked with the gout; and the fits were now become fo frequent and fevere, that not only the vigour of his conflitution was broken, but the faculties of his mind were fenfibly impaired. He therefore judged it more decent to conceal his infirmities in fome folitude, than to expofe them any longer to the public eye ; and as he was unwilling to forfeit the fame, or lofe the acquifitions of his better years, by attempting to guide the reins of government when he was no longer able to hold them with fteadinefs, he determined to feek in the tranquillity of retirement, that happinefs which he had in vain purfued amidft the tumults of war and the intrigues of fate.

In confequence of this refolution, Charles, who had already ceded to his fon Philip the kingdom of Naples and the duchy of Milan, effembled the fates of the Low Countries at Bruffels; and feating himfelf for the laft time in the chair of ftate, he explained to his fubjects the reafons of his refignation, and folemnly devolved his authority upon Philip. He recounted with dignity, but without oftentation, all the great things: which he had undertaken and performed fince the com. mencement of his adminiffration. "I have dedicated
(obferved he), from the 17 th year of my age, all my thonghts and attention to public objects, referving no portion of my time for the indulgence of eafe, and very little for the eajoyment of private pleafure. Either in a pacific or hoftile manner, I have vifited Germany nine times, Spain lix times, France four times, Italy feven times, the Low Countries ten times, England twice, Africa as often; and while my health permitted me to difcharge the duty of a fovereign, and the vigour of my conftitution was equal in any degree to the arduous office of governing fuch extenfive dominions, I never Thunned labour, nor repined under fatigue; but now, when my health is broken, and my vigour exhauted by the rage of an incurable diftemper, rny growing infirmities admonith me to retire; nor am I fo fond of reigning, as to retain the fceptre in an impotent hand, which is no longer able to protect my fubjects. Inftead of a fovereign worn out with difeafes (continued he), and fcarce half alive, I give you one in the prime of life, already accuftomed to govern, and who adds to the vigour of youth all the attention and faracity of maturer years." Then turning towards Philip, who fell on his knees, and kiffed his father's hand, "It is in your power (faid Charles), by a wife and virtuous adminiftration, to juftify the extraordinary proof which I give this day of my paternal affection, and to demonftrate that you are worthy of the extraordinary confidence which I repofe in you. Preferve (added he) an inviolable regard for religion; maintain the Catholic faith in its purity ; let the laws of your count: \(y\) be facred in your eyes; encroach not on the rights of your people; and if the time fhould ever come when you fhall wifh to enjoy the tranquillity of private life, may you have a fon to whom you can refign your fceptre with as much fatisfaction as I give up mine to you." A few weeks after, he refigned to Philip the fovereignty of Spain and America; referving nothing to himfelf out of all thefe valt poffeffions but an annual penfion of 100,000 crowns.

Charles was now impatient to embark for Spain, where he had fixed on a place of retreat; but by the advice of his phyficians, he put off his voyage for fome months, on account of the feverity of the feafon; 'and, by yielding to their judgment, he had the fatisfaction before he left the Low Countries of taking a confiderable ftep towards a peace with France. This he ardently longed for; not. only on his \{on's account, whofe adminiftration he wiffed to commence in quietnefs, but that he might have the glory, when quittiag the world, of reftoring to Europe that tranquillity which his ambition had banifhed out of it almolt from the time that he affumed the reins of government.

The great bar to fuch a pacification, on the part of France, was the treaty which Henry had concluded with the Pope; and the emperor's claims were too numerous to hope for adjufting them fuddenly. A A truce of five years was therefore propofed by Charles; five ye during which term, without difcuffing their refpective conclu preterifions, each flould retain what was in his poffef. with fion; and Henry, through the perfuafion of the conftable Montmorency, who reprefented the imprudence of facrificing the true interefts of his kingdom to the radh engagenents that he had come under with Paul, authorifed his ambaffadors to fign at Vaucelles a treaty \({ }_{\text {s }}\).

\section*{S P A}
the important conqueft which he had made on the Ger. man frontier, together with the greater part of the duke of Savoy's dominions.
The Pope, when informed of this tranfaction, was no lefs filled with terror and aftonifhment than rage and indignation. But he took equal care to conceal his fear and his anger. He affected to approve highly of the truce; and he offered his mediation, as the common father of Chriftendom, in order to bring about a definitive peace. Under this pretext, he appointed cardinal Rebibo his nuncio to the court of Bruffels, and his nephew cardinal Caraffa to that of Paris. The public inftructions of both were the fame; but Caraffa, befides thefe, received a private cornmiffion, to fpare neither in treaties, promifes, nor bribes, in order to induce the French monareh to renounce the truce and renew his engagements with the holy fee. He flattered IHenry with. the conqueft of Naples; he gained by his addrefs the Guifes, the queen, and even the famous Diana of Poictiers, duchefs of Valentinois, the king's miftrels ; and they eafily fwayed the king himfelf, who already leaned to that fide towards which they wifhed to incline him. All Montmorency's prudent remonftrances were difregarded ; the nuncio (by powers from Rome) abfolved Henry from his oath of truce; and that weak prince figned a new treaty with the Pope; which rekindled with frefh violence the flames of war, both in Italy and the Low Countries.

No fooner was Paul made acquainted with the fuccefs of this negotiation than he proceeded to the molt indecent extremities againf Philip. He ordered the Spanifh ambaffador to be imprifoned ; he excommunicated the Colonnas, becaufe of their attachment to the imperial houfe ; and he confidered Philip as guilty of high treafon, and to have forfeited lis right to the kingdom of Naples, which he was fuppofed to hold of the holy fee, for afterward affording them a retreat in his dominions.

Alarmed at a quarrel with the Pope, whom he had been taught to regard with the moft fuperfitious veneration, as the vicegerent of Chritt and the common father of Chrittendom, Philip tried every gentle method before he made ufe of furce. He even confulted fome Spanifh divines on the lawfulnefs of taking arms againft a perfon fo facred. They decided in his favour ; and Paul continuing inexorable, the duke of Alva, to whom. the negotiations as well as the war had been committed, entered the ecclefiaftical ftate at the head of \(10,000 \mathrm{ve}\) terans, and carried terror to the gates of Rome.

The haughty pontiff, though ftill inflexible and undaunted in himelf, was forced to give way to the fears of the cardinals, and a truce was concluded for 40 days. Mean time the duke of Guife arriving with a fupply of 20,000 Frencli troops, Paul became more arrogant than ever, and banifhed all thoughts from his mind but thofe of war and revenge. The duke of Guife, however, who had precipitated his country into this war, chiefly from a defire of gaining a field where he might difplay his own talents, was able to perform nothing in Italy worthy of his former fame. He was obliged to abandon the fiege of Civetella; he could not bring the duke of Alva to a general engagement; his army perifhed by difeafes; and the Yope neglected to furnifh the neces-
fary reinforcements. He begged to
France ftood in need of his abilities.
Philip, though willing to have avoided a rupture, was no fooner informed that Henry had violated the truce of Vaucelles, than he determined to act with fuch vigour, as thould convince Europe that his father had not erred in refigning to him the reigns of government. He immediately affembled in the Low Countries a body of 50,000 men, and obtained a fupply of 10,000 from England, which he had engaged in his quarrel; and as he was not ambitious of military fame, he gave the command of his army to Emanuel Philibert duke of Savoy, one of the greateft generals of that warlike age.

The duke of Savoy kept the enemy for fome time in fufpenfe with resard to his deftination; at laft he feemed to threaten Champagne; towards which the French drew all their troops; then turning fuddenly to the right, he advanced by rapid marches into Picardy, and laid fiege to St Quintin. It was deemed in thofe times a town of confiderable ftrensth ; but the fortifications ene French a town of confiderable frength ; but the fortifcations entirely dehad been much neglected, and the garrifon did not feated at amount to a fifth part of the number requifite for its St Quintin. defence: it muft therefore have furrendered in a few days, if the admiral de Coligny had not taken the gallant refolution of throwing himfelf into it with fuch a budy of men as could be collected on a fudden. This he effected in fpite of the enemy, breaking through their main body. 'The place, however, was clofely inveited; and the conftable Montmorency, anxious to extricate his nephew out of that perilous fituation, in which his zeal for the public had engaged him, às well as to fave a town of fuch importance, rafhly advanced to its relief with forces one half inferior to thofe of the enemy. His army was cut in pieces, and he himfelf made prifoner.

The cautieus temper of Philip on this occafion faved France from devaftation, if not ruin. The duke of Savoy propofed to overlook all inferior objects, and march fpeedily to Paris, which, in its prefent confternation, he could not lave failed to make himfelf matter of; but Philip, afraid of the confequences of fuch a bold enterprife, defired him to continue the fiege of St Quintin, in order to fecure a fafe retreat in cafe of any difaltrous event. The town, long and gallantly defended by Coligny, was at laft taken by form ; but not till France was in a ftate of defence.
Philip was now fenfible that he had loft an opportunity which could never be recalled, of diftreffing his enemy, and contented himfelf with reducing Horn and Catelet ; which petty towns, together with St Quintin, were the fole fruits of one of the moft decifive victories gained in the 16th century. The Catholic king, however, continued in ligh exultation on account of his fuccefs; and as all his paffions were tinged with fuperftition, he vowed to build a church, a monaftery, and a palace, in honour of St Laurence, on the day facred to whofe memory the battle of St Quintin had been fought. He accordingly laid the foundation of an edifice, in which all thefe were included, and which he continued to forward at vaft expence, for 22 years. The fame principle which dictated the vow directed the building. It was fo formed as to refemble a gridiron - on which culinary inftrument, according to the legendary tale,
\(4 \mathrm{M}_{2}\)

Spain. St Laurence had fuffered martyrdom. Such is the origin of the famous efcurial near Madrid, the royal refidence of the kings of Spain.

The firf account of that fatal blow which France had received at St Quintin, was carried to Rome by the courier whom Henry had fent to recal the duke of Guife. Paul remonftrated warmly againit the departure of the French army; but Guife's orders were pereinptory. The arrogant pontiff therefore found it neceffary to accommodate his conduct to the exigency of his affairs, and to employ the mediation of the Venetians, and of Cofmo de Mcdici, in order to obtain peace. The firf overtures of this nature were eagerly littened to by the Catholic king, who till doubted the juftice of his caufc, and confidered it as his greateft miffortune to be obliged to contend with the Pope. Paul agreed to renounce his league with France; and Philip ftipulated on his part, that the duke of Alva fhould repair in perfon to Rome, and after afking pardon of the holy father in his own name and in that of his mafter, for having invaded the patrimony of the church, fhould receive abfolution from that crime. Thus Panl, thro? the fuperflitious timidity of Philip, only finifhed an unpropitious war not without any detriment to the apoftolic fee, but faw his conqueror humbled at his feet : and fo exceffive was the veneration of the Spaniards in that age for the papal character, that the duke of Alva, the proudeft man perhaps of his time, and accuftomed from his infaricy to converfe with princes, acknowledged, that when he approached Paul, he was fo much overawed, that lis voice failed, and his prefence of mind forfook him.

But though this war, which at its commencement threatened mighty revolutions, was terminated without occafioning any alteration in thofe ftates which were its immediare object, it produced effects of confiderable confequence in other parts of Italy. In order to detach Octavio Farnefe, duke of Parma, from the French intereft, Philip reftored to him the city of Placentia and its territory, which had been fcized by Charles V. and he granted to Cofmo de Medici the inveltiture of Sienna, as an equivalent for the fums due to him. By thefe treaties, the balance of power among the Italian ftates was poifed with more equality, and rendered lefs variable than it had been fince it received the firt violent fhock from the invafion of Charles VIII. and Italy henceforth ceafed to be the theatre on which the monarchs of Spain, France, and Germany, contended for fame and dominion. Their hoftilities, excited by new objects, ftained other regions of Europe with blood, and made other flates feel, in their turn, the miferies of war.
The French The duke of Guife, who left Rome the fame day that unfuccersful his adverfary the duke of Alva made his humiliating in the low fubmiffion to the Pope, was received in France as the Countries. guardian angel of the kingdom. He was appointed lieutenant-general in chief, with a juriddiction almoft unlimited; and, eager to juftify the extraordinary confidence which the king had repofed in him, as well as to perform fomething fuitable to the high expectations of his countrymen, he undertook in winter the fiege of Calais. Having taken that place, he next invefted Thionville in the duchy of Luxembourg, one of the ftrongeft towns on the frontiers of the Netherlands; and forced it to capitulate after a fiege of three weeks. But
the advantages on this quarter were more than balanced by an event which happened in another part of the Low Countries. The marefchal de Termes governor of Calais, who had penetrated into Flanders and taken Dunkirk, was totally routed near Gravelines, and taken prifoner by count Egmont. This difafter obliged the duke of Guife to relinquifh all his other fchemes, and lialten towards the frontiers of Picardy, that he might there oppofe the progrefs of the enemy.

The cycs of all France were now turned towards the duke of Guife, as the only general on whofe arms victory always attended, and in whofe conduct as well as good fortune they could confide in every danger. His ftrength was nearly equal to the duke of Savoy's, each cominanding about 40,000 men. They encamped at the diftance of a fcw leagues from one another; and the French and Spanifh monarchs having joined their refpective armies, it was expected that, after the viciffitudes of war, a decifive battle would at laft determine which of the rivals fhould take the afcendant for the future in the affairs of Europe. But both monarchs, as if by agreement, ftood on the defenfive; neither of them difcovering any inclination, thongh each had it in his power, to reft the decifion of a point of fuch importance on the iflue of a fingle battle.

During this ftate of inaction, peace began' to be men- Peace c tioned in each camp, and both Henry and Philip dif-cluded covered an equal difpofition to liften to any overture \(\begin{aligned} \text { tweet } \\ \text { and }\end{aligned}\) that tended to re-eftablifh it. The private inclinations philip. of both kings concurred with their political interefts and the wifhes of their people. Philip languifhed to return to Spain, the place of his nativity ; and peace only could enable him, either with decency or fafety, to quit the Low Countries. Henry was now defirous of being freed from the avocations of war, that he might have leifure to turn the whole force of his government towards fuppreffing the opinions of the reformers, which were fpreading with fuch rapidity in Paris and the other great towns, that they began to grow formidable to the eftablifhed church. Court-intrigues confpired with thefe public and avowed motives to haften the negotiation, and the abbey of Cercamp was fixed on as the place of congrefs.

While Philip and Henry were making thefe advances towards a treaty which reftored tranquillity to Eum rope, Charles V. whofe ambition had fo long difturbed it, but who had been for fome time dead to the world, ended his days in the monaftery of St Juftus in Eftremadura, which he had chefen as the place of his retreat, Dcath as is particularly related under the article Charles V.

After the death of Charles, the kingdom of Spain foon loft great part of its confequence. Though Charles had ufed all his intereft to get his fon Pliilip clected emperor of Germany, he had been totally difappointed; and thus the grandeur of Philip II. never equalled that of his father. His dominions were alfo confiderably abridged by his tyrannical behaviour in the Netherlands. In confequence of this, the United Provinces revolted; Revolt 143 and after a long and bloody war obtained their liberty*. the Unit In this quarrel Elizabeth of England took part againft Provirce Plilip, which brought on a war with Spain. The great loffes he fuftained in thefe wars exhaufted the kingdom both of men and money, notwithftanding the great fums imported from America. Indeed, the difcovery and conqueft of that country hath much impoverifhed, in-

Itead

\section*{\(S \quad \mathbf{P} \quad A\)}
ftead of enriching Spain ; for thus the inhabitants have been rendered lazy and averfe from every kind of manufacture or traffic, which only can be a durable fource of riches and ftrength to any nation. The ruin of the kingdom in this refpect, however, was completed by Philip III. who, at the inftigation of the inquifition, and by the advice of his prime minifter the duke of Lerma, expelled from the kingdom all the Morcfcoes or Moors, defcendants of the ancient conquerors of Spain. Thirty days only were allowed them to prepare for their departure, and it was death to remain beyond that time. 'The reafon for this barbarous decree was, that thefe people were fill Mahometans in their hearts, thourgh they conformed externally to the rites of Chriftianity, and thus might corrupt the true faith. 'The Morefcoes, however, chofe themfelves a king, and attempted to eppofe the royal mandate; but, being almoft entirely unprovided with arms, they were foon obliged to fubmit, and all banifhed the kingdom. By this violent and impolitic meafure, Spain loft almoft a million of induftrious inhabitants; and as the kingdom was already depopulated by bloody wars, by repeated emigrations to America, and enervated by luxury, it now fank into a fate of languor from whence it has never recovered.

In confequence of this languor, and the maladminiftration of the Spanifh governors, Portugal, which had been reduced by Philip II. revolted, and has ever fince been an independent kingdom \(\ddagger\). However, the memory of what Spain once was, remained for a confiderable time, and the power of that kingdom long continued to be feared after it had ceafed to be powerful. In the time of queen Anne, a Britifh army was feen for the firft time in Spain, in order to fupport Charles of Auftria againft Philip the grandfon of Louis XIV. The ill fuccefs of that attempt is related under the article \(\mathrm{Briman}_{\text {rin }} \mathrm{n}^{\circ} 342-359\); and thus the crown of Spain fellato a branch of the houfe of Bourbon, in confequence of which the courts of France and Spain generally acted in the clofelt concert till the revelution, which at prefent aftonifhes Europe, put an end to monarchical government in the former country. The wars of thefe two courts with Britain are related under that article and America; and thefe, with an unfucce'sful attempt on Algiers, and the threatened war refpecting Noоткл Sound (fee that article), conflitute the noft important part of the Spanifh hiftory till the depofition and murder of Louis XVI. of France. On that event Spain joined her forces to thofe of the Empire, Britain, and Pruffia, to chattife the Convention, and prevent thofe democratical principles which had suined France from being fpread through the other nations of Europe. We cannot fay that her exertions added much to the ftrength of the alliance; and being unable to defend herfelf againft the furious inroads of the republican troops, fhe was glad to make a feparate peace with the Convention. See Revolution.

The air of Spain, during the months of June, July, and Auguit, is exceffively hot in the day-time; but the reft of the year it is pleafant and temperate. Even during the above months it is very cool in the fhade; andro cold in the night, that it makes a traveller fhiver; and in the day-time the violent heat continues only for about four or five hours. In the north, on
the mountains, and near the fea-coaft, the air is much lefs fultry in fummer than in the fouth, efpecially in the lower parts of the country, and at a diftance from the fea. It feldom rains here, except about the equinoxes: the frofts are very gentle towards the fouth; but on the mountains in the north and north-calt the air is very fharp in winter.

Though there are fome fandy barren deferts in the Soil and fouth, and many barren mourtains in the north, yet in produce. the greater part of the country, particularly in the valleys and plains, the foil is good, producing a great variety of rich wines, oil, and fruits; fuch as oranges, lemons, prunes, citrons, almonds, raifins, dates, figs, chefnuts, pomegranates, capers, pears, and peaches ; but not a fufficiency of grain, which is chiefly owing to the neglect of tillage. Wheat and barley are the molt common grain; the former of which is faid by fome to be the belt in Europe. There is not much flax, hemp, oats, or hay, in Spain : but there is plenty of honey, falt, fine wool, filk, and cotton; and, in fore places, of rice and fugar-canes. Here alfo are abundance of mules, and, in fome provinces, of horfes, together with deer, wild-fowl, and other game, chamois and other goats, but few horned cattle. Wolves are almof the only wild beafts in the country. The herb kali, which is ufed in making falt, foap, and glafs, grows in great plenty on the fea-hore. The wild bulls, ufed in their bull-fights, are bred in Andalufia. The feas about Spain: are well ftored with fifh; among which is the anchovy, in the Mediterranean. We may guefs at the number of fheep here by that of the fhepherds, which is faid to be about forty thoufand. The fheep that bear the fine wool move regularly, every funmer, from fouth to north, along the mountains, which yield a great variety of fweet herbs and plants, and return again towards winter. During this progrefs, large quantities of falt are diftributed among them, and all poffible care is taken both of their health and fleeces.

The chief mountains are the Pyrenees, which ftretch Mountaings from the Mediterranean to the Atlantic Ocean, but not minerals, in a direct line, for near 200 miles : their breadth is, \&c. in fome places, not lefs than 80 . That called the Pic \(d_{e}\) Midi is of a prodigious height. Over thefe mountains there are only about five paffages out of Spain into France, and thefe alfo narrow; even the valleys between the mountains are covered with thick and lofty woods. The other chains in Spain are the Sierra d'Occa, Sierra Molino, Sierra Moreno, and Sierra Novada or the fnowy mountains. Near Gibraltar, oppod fite to Mount Abyla in Africa, ftands the celebrated Mount Calpe : thefe were anciently called Hercules's pilhrs. The mountains yield great quanticies of tim: ber for Chipping, which are conveyed by the Ebro and other rivers to the Mediterranean. According to the ancient and modern writers, they abound alfo with golds. filver, iron, lead, tin, cinnabar, quickfilver, alum, vir triol, copperas, lapis calaminaris, \&ic. befides gems, and mineral waters both hot and cold. The gold and filver mines are not worked a.t prefent, but thofe of iron are. The neglect of the former is owing partly to the indolence of the Spaniards, and partly to the gold and filver imported from America. Belides the rivers Minho, Douro, Tagus, Monda, Lima, and Guadiana, mention ed in Portugal, but which have their fources in Spain,

\section*{S P A [ 646 ] S P A}
the moit confiderable are the Ebro, formerly Therus, Guadalavier, anciently Turia, Guadalquiver or Batis, Segura, and Xucar.
The Spaniards are zealous Romanits̀. Nowhere is there more pomp, farce, and parade, in what regards religion; and nowhere lefs true Chriftianity. Their zeal and their fuperitition exceed that of any other Ro. man Catholic country, unlefs perhaps we fhould except Portugal. Nowhere did the inquifition reign with great= er terror; there being no fubject who was not liable to be profecuted by the boly office, as it is called; however, the powers of that tribunal are now greatly diminifhed even in Spain. There are eight archbifhops in Spain, feven in America, and one in Afta at Manilla; each of which has his fuffiagan bifhops. 'The archbifhop of Toledo is primate, chancellor of Caftile, and, by virtue of his office, privy-counfellor. He is faid to have a revenue of 100,0001 . Sterling per annum, or more. The king nominates all archbifhops and bifhops; and fince 1753 all fmall benefices are alfo in his gift. He has alfo lately obtained a power to tax ecclefiattical por. feffions, according to his, pleafure and the exigency of affairs. Though the reft of the nation is poor, the clergy are immenfely rich, and their revenues of all kinds very great. Moft of the towns and eftates belong to them, and are exempt from all public burdens; yet their avarice is infatiable, efpecially that of the Mendicant friars, though they profefs poverty. Their commerce, which is free from all duties and impofts, is alfo a rich fund to them. Thcugh the Spaniards are naturally men of wit and of an elevated genius, yet little progrefs in the fciences is to be expected from them, while the clergy ufe their utmoft efforts to keep them in ignorance, branding all literary relearches with the name of herefy, and inveighing againft the feats of the mufes as the fchools of hell, where the devil teaches forcery. There are 22 univerfities, and feveral academies, in Spain ; but fo conftituted, and under fuch reftrictions, that they can never attain to any meafure of true learning. There are few printing-houfes in Spain; and moft of the books in that language are publifhed in other countries.
150
Trade and In regard to trade and manufactures, the Spaniards manufac- are far from making fuch a figure as might be expecteures. are from making fuch a figure as might be expect- manufactures, and handicrafts, is performed by the French, efpecially in the two Caftiles and the midland provinces, the natives being either too lazy or too proud to foop to fuch employments. By thefe means, the French ufually return with large fortunes to their own country. The chief manufactures of Spain are thofe of filk, wool, iron, copper, and other hardwares; but thefe fall far fhort of the flourifhing condition to which they might be brought: hence a great part of the treafures of America go to the foreign merchants, who fupply them with goods for that part of the world. However, it is certain, that Spain, fince it hath had princes of the houfe of Bourbon upon the throne, hath improved its revenues, increafed its forces by fea and land, and applied itfelf more than it did before to manufactures and hufbandry; having , fhaken off, in fome meafure, that jdie indolent difpofition which rendered it fo contemptible in the eyes of other nations; but it will be a long time before they will be able to fupply the wants of their own country, and thofe of America, in any great
degree. Spain is extremely well fituated for trade : but moft of its produce is exported by foreigners, except what is carried to the Indies ; and even with regard to that trade, they are little better than factors to the Englifh, French, Dutch, and Italians. Smuggling, which was formerly carried to a great height, is now in a great ineafure fuppreffed. Since the year 1750 , the exportation of filver hath been allowed on the payment of 3 per cent. From 1735 almoft to 1756, the flotas and galleons were difcontinued, and the trade to America carried on in regifter-fhips, which any merchant might fend, on permiffion obtained from the council of the Indies: but then the flotas and galleons were reftored. The Affogue fhips are two veffels which carry quickfilver on the king's account to Vera Cruz. There is a company which has an exclufive grant for trading to the Caraccas ; and another for trading to Porto Rico, the Bay of Honduras, the province of Guatimala and Hifpaniola ; but the Spanifh part of the laft, it is faid, hath been lately ceded to the French. One Rip, and fometimes two, fails annually from Manilla, in the ifland of Luconia, one of the Philippines, for Acapulco in Mexico: her cargo, which belongs to the convents, confifts of the principal commodities of that part of the world; but the return from Acapulco is for the moit part made in money, and amounts to a vaft fum, as appeared from the treafure found on board the Acapulco thip taken by Lord Anfon. In return for the manufactures fent to America, the Spaniards receive gold, filver, cochineal, indigo, the cocoa or chocolate nut, logwood and other dyeing woods, fugar, tobacco, fuuff, and other productions of that part of the world; fupplying moft part of Europe and Afia with the filver which they bring from thence in their galleons. In the time of the Moors and Goths, this kingdom was exceedingly populous. It is faid to have then contained between twenty and thirty millions; whereas now it does not contain above nine : and this, among other caufes, is owing to the pride and lazinels of the inhabitants, want of manufactures and good regulations, neglect of the mines and agriculture, the expulfion of the Monrs, the peopling of America, heavy taxes, the great number of convents, exceffive venery, and the confequent infecundity of both fexes. 'Their debauchery and fterility are partly occafioned by their way of living; for they make great ufe of fpices, and drink a great deal of chocolate, and ftrong wine mixed with brandy. The caufes affigned for the want of people in Spain will account in fome meafure for its poverty; notwithftanding it is computed that it receives one year with another, fetting afide other fums, above 26 millions of pieces of eight, in regiftered gold and filver. As moft of the manulactures that are fent to America are furnifhed by Britain, France, Italy, and Holland, fo a great part of the treafure brought home by the galleons is paid to the merchants of thofe nations.

The conftitution of Spain is at prefent an abfolute Conft hereditary monarchy, where the females inherit in de tionan fault of the males. The king, in his title, enumerates vernnu moft of the provinces and particular parts of the dominions he has been or is poffeffed of. In fpeaking of him, he is commonly called his Catholic Majefty, or the Catholic King. The hereditary prince is commonly fyled Prince of Afturias, and the other royal children Infants. The kings of Spain are never crowned; they

\section*{\(S\) P A \\ [ 647 ] \\ \(S\) P A}
feem to have a power to difpofe of the crown to what branch of the royal family they pleafe. For the adminiftration of the rovernment and of juftice, here are feveral councils and tribunals; as the junto or cabinetcouncil, the privy-council, the council of war, the council of Caftile, the council of the inquifition, the council of finances, the council of the Indies, the leven courts of royal audiences, \&c.

The general hiftory of Spain proves how great an Tra- influence the Cortes had in former times in the moft important affairs of government; fuch as war or peace, and the levying of taxes. Jut during a long courfe of years they have not been affembled, except for the fake of form ; and the fovereigns, without yiolence, or formally rejecting their intervention, have found means to elude their authority. They promulgate from the throne certain ordinances under the name of Pragmatics, the preambles of which give us to underftand, that they claim the fame authority as if they had been publifhed in the affembly of the Cortes; who are never convoked but at the acceffion of a new monarch, to adminifter to him an oath in the name of the nation, and to fwear fidelity to him. As thris event happened fo lately as the month of September 1789 , when the prefent king of Spain received the homare of all his fubjects in the church of St Jerome at Madrid, it may not be unacceptable to give an account of the ufual mode of af fembling them.
"On this occafion letters of convocation are fent to all the Grandees; to all perfons bearing titles of Caf tile ; to all the prelates; and to every city which has a right to fend deputies to the Cortes. The two firlt claffes reprefent the nobility; the prifts fit in the name of the clergy; and the cities, which depute one of their magittrates, reprefent the people." Except on the above-mentioned occafion, the Cortes of the whole kingdom have been affembled but twice during the prefent century, and only once upon public bufinefs, in the year 1713 , when Philip V. convoked them to give their approbation to the Pragmatic Sanction, which changed the order of fucceffion to the throne. They are ftill cenfulted, for the fake of form, in certair cales; but then, the members of which they are compofed correfpond with each other without affembling. At their breaking up in 1713 , it was regulated, that they fhould be reprefented by a permanent committee, whofe office it fhould be to watch over the adminillration of that part of the taxes known by the name of Millones, and which had been granted under Philip II. with the formal confent of the Cortes, upon certain conditions, which the monarch fwore to obferve. They retained the adminiftration of thefe impofts until the year 1718 , when cardinal Alberoni, whofe ardent and imperious genius was irritated at fuch fhackles, transferred it to the hands of the fovereign. From that time, the affemblies of the deputies of the kingdom have received no more of the revenues of the fate than is neceffary to pay the falaries and defray the expences of the members. Thefe are eight in number; and are chofen in the following manner : All the provinces of Caltile unite to nominate fix ; Catalonia and Majorca appoint one; and the regencies of Valentia and Aragon elect the eighth. Thele deputies hold their places fix years, at the end of which a new lection rakes place in the fame manner. As a selict of their ancient rights, they fill retain the privi-
lege of being, by virtue of their places, members of the council of finances, by which the fovereign communicates to the nation the neceffity of levying any new tax; and the approbation they are fuppofed to give to the royal refolution, is a fhadow of the confent of the Cortes, without which taxes could not formerly be either levied or augmented. But it is cafy to perceive how feeble this rampart of liberty mult be, which is only formed of a finall number of citizens, who poffefs but little real power; are under the controul of government, from which they expect favours and preferments; and who, after all, reprefent the moft numerous indeed, but leaft refpected, part of the nation. The provinces of Bifcay and Navarre, which have affemblies and particular privileges, fend alfo, on fome occafions, deputies to the throne; but they do not make a part of the body of the deputies of the kingdom, and their conftituents fix at pleafure the object and duration of their temporary miffion.

The adminiftration of Spain is divided into fix principal departments. The minifter for foreign affairs is in many refpects the directing miniter, and receives, as: a mark of diftinction, the title of fecretary of fiate. Theminitter of war has but a circumferibed authority. He is prefident of the council of war, which is rather a tribunal than a board of adminiftration ; but the infpectors of the infantry, and thofe of the cavalry, dragoons, and provincial regiments, draw up a ftatement of whatever relates to the corps of which they have the direction; and the minifter at war has only to prefent the memorials they give in to the king. The marine minifter has no affociates. The chiefs of the three departments of Ferrol, Carthagena, and Cadiz, and infuectors of the marine, are named by the king, on the reprefentation of the minifter; but the marine ordinances prepared by him alone, require only the fanction of the king. The minifter of the finances fhould properly be under the infpection of the fuperintendantgeneral of that department ; but thefe two offices were fome time fince united, and will probably be fo continued; for the feparation of them would multiply, without neceffity, the fprings of goverument; and the in terefts of the fate require that they fhould be fimplified as much as permanent forms, thofe facred bulwarks of juftice and property, will admit.

The higher nobility confift of counts, marquifes, and dukes. The grandees, who have precedence of all others, next the king and princes of the blood, are named out of thefe. They have the privilege of being covered in the king's prefence, who ftyles them in his letters Illuffious; and in fpeaking to them or of them, their Eminences: but there are others befide the grandees who are covered in the king's prefence; as cardinals, nuncios, archbifhops, the grand prior of Caftile and the grand prior of Malta, the generals of the orders of St Dominic and St Francis, ambaffadors of crowned heads, the knights of the golden fleece, and of the three military orders of St James, Calatrava, and A.lcantara, when the king affitts at their refpective chapters in quality of grandmafter. No grandee can be apprehended for any crime but by the exprefs order of the king; and they have many other privileges befides. thefe. The inferior nobility Ayle themfelves Cavalleros. and Hidalgos.
Of the orders in Spain, that of the golden fleece is,

Spain. the principal; which was inftituted in 1430 by Philip
152
Orders of knighthood.

The language of this country, efpecially that fpoken in Caftile, which is by far the pureft, approaches the neareft to the Latin of any language in Europe, mixed with Arabic words and terminations introduced by the Moors. In fome provinces, the vulgar tongue is a dialect of the old Frencl, or rather Gaicon, which is little underftood in the others. In Bifcay, the language is faid to be a dialect of the Gothic or Celtic, and to have fome analogy with the Welch and Irifh. As to what regards the character of the Spaniards, they do not want either an inclination or capacity for the fciences; but have hardly an opportunity of acquiring any true learning or knowledge, at leaf in their fchools and univerfiqies. They are admired for their fecrecy, conftancy, ravity, patience in adverfity, and loyalty. They are alfo faid to be true to their word, great enemies to lying, and fo nice and jealous in point of honour, that they will ftick at notling to wipe off any ftain that is caft upon it. Among their vices and defects are reckoned their pride and contempt of foreigners, their indolence, lazinefs, luft, bigotry, and credulity in believing the feigned miracles and legends of their monks. They are alfo faid to be extremely paffionate, jealous, and vindictive ; and are noted, above any other European nation, for defpiling atid neglecting agriculture, arts, and
-manufactures.
eetions . We will here fubjoin fome directions for travelling in ravelling spain by Mr Townfend, a late refpectable traveller; as in Spain. they will enable the reader to form a more diftinet notion of the ftate of that country than he could obtain from general defcription.
Townfend's Travels, vol. i.
" To travel commodioufly in Spain, a man fhould have a good conftitution, two good fervants, letters of credit for the principal cities, and a proper introduction to the beft families, both of the rative inhabitants and of ftrangers fettled in the country.
"The language will be eafily acquired.
\({ }^{\text {st }}\) His fervants fhould be a Spaniard and a Swifs; of
which one fhould be fufficiently acquainted with the art of cooking, and with the fuperior art of providing for the journey ; which implies a perfect knowledge of the country though which lie is to pafs, that he may fecure a ftock of wine, bread, and meat, in places wherc thefe excel, and fuch a ftock as may be lufficient to carry him through the diftriets in which thefe are not to be obtained. For himfelf, his fervants, and his baggage, he mouid purchafe three Itrong mules, able to fupport the load which is to be put upon them. In his baggage he fhould have fheets, a matrafs, a blanket, and a quilt, a table-cloth, knives, forks, and fpoons, with a copper veffel fufficiently capacious to boil his meat. This fhould be furnifhed with a cover and lock. Each of the fer: vants fhould have a gun flung by the fide of his mule.
" To travel as an economitt in Spain, a man muft be contented to take his chance for conveyance, and either go by the poft, wherever it is eftablifhed; or join with officers, going to their various ftations; to hire a coach, or quietly refign himfelf to a calafh, a calafine, a horfe, a mule, or a borrico. This laft is the moft convenient for the purpofe of croffing the country, or of wan. dering among the mountains. If he is to traverfe any' diftrict infefted by banditti, it will be fafe for him to go by the common carriers, in which cafe he will be mounted on a good mule, and take the place which would have been occupied by fome bale of goods. Any one, who is fond of botany, for hort excurfions, will make choice of a borrico. I'his is always to be had when, as in fome villages, neither horfe nor mule are to be obtained. I have ufed this honourable appellation for the moft patient of all animals, becaufe I would not thock the delicacy of a young traveller, by telling him, at his firf fetting out, that he may fometimes find himfelf under the neceffity of riding upon an afs. He muft, however, know, for his confolation, that an afs does not appear fo contemptible in Spain as in the colder regions of the north.
"The beft time for him to begin this expedition is in autumn, when he may go by Bayonne, Burgos, Valladolid, and Segovia, haftening to the court at \(S_{t}\) Ildefoufo. Here he is to procure letters for the chief cities in Spain. On thefe will depend the whole pleafure of his excurfion. During the winter he may fee all the fouth of Spain, Toledo, Cordova, Seville, Cadiz, Gibraltar, Malaga, Granada, Carthagena, Murcia, Alicant, Valencia, and Barceloná. Returning by Zaragoza to Aranjuez in the fpring, he may follow the Merino flock to the mountains of the north, whilf the country, on which he has turned lis back, is rendered unfit for travelling, by the diffolving heats, by want of provifions, and by malignant fevers. This feafon will be beft employed in Galicia, the Afturias, and the provinces of Bifcay, taking Salamanca and Leern in the way."

Nezu Spain. See Mexico.
SPALATRO, or Spalatte, a rich, populous, and ftrong town of the republic of Venice, capital of Venetian Dalmatia, with a good harbour and an archbifhop's fee. Here are the ruins of the palace of Dioclefian, of which the late Mr Robert A dam publifhed in \({ }_{1} 1764\) a fplendid account, enriched with 71 folio plates. In 1784 , Spalatro was nearly depopulated by the plague. It is Itrong by fituation, being built on a peninfula, which is joined to Terra Firma by a neck of land half a mile over. It is feated on the Gulf of Venice, 35 miles

\section*{S P A [ 649] S P A}

South eaft of Sebenico, and 102 north-weft of Ragufa. E. Long. 17. 3 I. N. Lat. 44. 4.

SPAN, a meafure taken from the face between the thumb and the tip of the little finger when both are ftretched out. The fpan is eftimated at three hand's breadths or nine inches.

SPANDRELL; the folid work on each haunch of an arch, to keep it from fpreading.

SPANHEIM (Ezekiel), a learned writer in the 17 th century, was borr at Geneva in 1629 ; and in 1642 went to Leyden to ftudy. Here he diftinguifhed himfelf to great advantage; and his reputation freading, Charles Louis elector palatine fent for him to be tutor to his only fon. This tafk our author difcharged to the entire fatisfaction of the elector ; by whom he was alfo employed in divers negotiations at foreign courts. He afterwards entered into the fervice of the elector of Brandenburg, who in 1680 fent him envoy-extraordinary to the court of France, and foon after made him a minifter of ftate. After the peace of Ryfwic, he was again fent on an embafly to France, where he continued from the year 1697 to 1702 . The elector of Brandenburg having duritg that interval affumed the title of King of Pirufia, conferred on him the title and dignity of a baron. In 1702 he left France; and went ambaffacior to England, where he had been feveral times. Here he died in 1710 , aged 81 years. It is -furprifing, that in difcharging the duties of a public minifter with fo much exactnefs, and amidft fo many different journeys, he could find time enough to write the feveral books publifhed by him. It may be faid of him, that he acquitted himfelf in his negotiations like a perfon who had nothing elfe in his thoughts; and that he wrote like a man who had fpent his whole time in his ftudy. The principal of his works are, 1. De praftantia et ufu numifmatum antiquorum; the beft edition of which is in two volumes folio. 2. Several letters or differtations on fearce and curions medals. 3. A preface and notes to the edition of the emperor Julian's works, printed at Leipfic in 1696 , folio.

SPANIEL, in zoology. See Canis.
SPAR, in mineralogy, a name given to thofe earths which break eafily into rhomboidal, cubical, or laminated fragments with polifhed furfaces. As the term fpar is thus applied to fones of different kinds, without any regard to the ingredients of which they are compofed, fome aderitional term muft be ufed to exprefs the conftituent parts as well as the figure ; for inflance, calcareous fpar, gypfeous fpar, \&cc. The fpars found in Britain and Ireland are of four different fpecies; opaque, refracting, diaphanous, and falactitical. 1. The opaque fpar is rhomboidal, hexangular, and triangular, of various colours, and is found in mines in Wales, Derbythire, \&c. and at Ovens near Cork. 2. The refracting fpar is rhomboidal, fhows objects feen through it double, and fometimes 8, 12 , or 16 images at once. It is frequent in the lead mines of Derbyfhire, Yorkfhire, \&c. 3. Diaphanous fpar is rhomboidal, triangular, hexangular, pyramidal or columnar; and is found in mines, quarries, and caverns, in many different places. 4. Stalactitical !par, icicle or drop-ftone, is formed by the running or dropping of water, containing a large proportion of calcarcous carth. It is opaque, generally bminated, but from accidental circumftances affumes va-

Vob, XVII. Part II.
rious forms. It occurs at Knarefborough in Yorkfhire, and at Ovens near Cork.

A new fpecies of fpar has lately been found in the Eaft Indies, which, from its extreme hardnefs, approaching to that of a diamond, is called adamantine jpar. It was difcovered by Dr Black of Edinburgh to be a diftinct fpecies. Happening one day to vifit a lapidary, it was fhown to him among other fpecimens as a ftone that was ufed in the Eaft Indies for polining gems, and grinding other hard fubftances. Dr Black immediately fingled out a fpecimen which he fent to Mr Greville, who requefted \(M\). Klaproth to analyze it.

There are two varieties of this fpar; one of them comes from China, and cryftallizes in hexagonal prifme without pyramids, the length of the fides varying from fix to twelve lines; their breadth being about nine, of a grey colour with different fhades. Though the entire pieces are opaque, the thin laminæ are tranfparent, and when broken, itg furface appears nightly ftriated. Its cryftals are covered with a very fine and ftrongly adhering cruft, compofed of fales of filvery mica, mixed with particles of red feld-fpar. Sometimes the furface has martial pyrites or yellow fulphuret of iron adhering to it. Its hardnefs is fo great, that it not only cuts glafs as eafily as the diamond, but even fcratches rockcryttal and other very hard fones. Its \{pecific gravity is to that of water as 3710 to 1000 . Sometimes it contains cryftallized graius of magnetic oxyd of iron, which may be feparated from thic fone when pulverized by means of the loadftone.

The other kind found in Hindoftan is of a whiter colour, and of a more laminated texture than the former the grains of iron contained in it are likewife of a fmaller fize than thofe of the former ; they are not diffufed through its fubftance, but only adhere to its furface.

This fpar is exceedingly difficult to analyze. To do fo, M. Klaproth was obliged to melt it no lefs than 12 times with 15 parts of foda or mineral alkali, in a filver crucible; the heat being eack time continued for five hours as ftrong as the crucible could bear. After each fufion the mafs was foftened by boiling diftilled water, filtering and precipitating by acids the fmall quantity of earth which the alkali liad diffolved ; and laftly; that portion which had not been decompofed was digefted at different times with concentrated and boiling acids. By this tedious procefs he at length found, that the fpar confifted of alumine and another kind of carth, in the proportion of 2 to 1 , the nature of which is not underftood. It is not filiceous earth, as it does not combine with fixed alkalis in a melting heat ; and for want of opportunities to make a fufficient number: of experiments, our author was unable to determine whether it be a fixth fimple earth, or a compofition of two or morc earths which he was not able to feparate.

From a letter of M. Morveau to Mr Crell, it appears that this flone is alfo found in France. A fmall bit of this was tried by him in prefence of Mr Wedgewood, and he found that its fpecific gravity was fuperior to the fpar of China, being no lefs than 4.1803 , and the true adamantine fpar of China gave 3.8222 .
sPARGANIUM, bur-Reed, in botany: A gcnus of plants belonging to the chafs of monacia, and to the order of triandria; and in the natural fyttem ranged under the 3 d order, Calamarii. The amentum of the

4 N
male

\section*{S P A}
male flower is roundif, the calyx is triphyllous, and there is no corolla. The amentum of the female flower refembles that of the male. The ftigma is bifid; the fruit is a dry berry containing one feed. There are two fpecies, the erectum and natans, both of them natives of Great Britain and Ireland. I. The Ereflum, great burreed, has a ftem two or three feet high, erect, firm and branched; the lower leaves are triangular, the upper ones plain. The male heads, are much fmaller than the female. This fpecies fowers in July, and is frequent on the banks of rivers and lakes and near flagnant waters. 2. The Natans, floating or little bur-reed, has a ftalk about two feet long. The leaves float, are about a foot long, one-fourth of an inch wide at the bafe, and one-eighth in the middle, and end in a point. The male sphorules are cenerally three, and all feffile; the female are commonly three, the two lower being fupported on peduncles, the upperinoft feffile. It flowers in July, and grows in pools and lakes, but is rare.

SPARMANNIA, in botany; a genus of plants belonging to the clafs of polyandria, and to the order of monogynia. The corolla confifts of four petals, and is bent back; the nectaria are numerous, and fwell a little; the calyx is quadriphyllous; the capfule is angulated, quinquelocular and echinated. There is only one fpecies, the Africana.

SPARTA; or LAcEDemon, the capital of the country of Laconia in Greece, an ancient and moft renowned ftate, the inhabitants of which have been in all arfes celebrated for the fingularity of their laws and character. - The hiftory of Sparta for many ages is entirely
fabulous; and the authentic accounts commence only with the celebrated lawgiver Lycurgus, who flourifhed about 870 B. C. See the article Lycurgus.
After his death, the firft important tranfaction which we find mentioned in the Spartan hifory is the Meffemian war, which commenced in the year 752 B . C. and ended in the total reduction of the Meffenian territory, as related under the article Messenia. During this period, according to fome authors, a preat change took place in the government of Sparta. This was the creation of the ephori, which is afcribed to one of the kings named Theopompus. This man perceiving that there was a neceffity for leaving magiftrates to execute the laws, when the kings were obliged to be in the field, appointed the magiftrates above mentioned, who afterwards made fo great a figure in the flate (fee EpHOR1). One great privilege of the ephori was, that they did not rife up at the prefence of the kings, as all other magiftrates did : another was, that if the kings offended againt, the laws, the ephori took cognizance of the offence, and inflicted a fuitable punifhment. From the firft election of the ephori, the year was denominated, as at Athens, from the firf election of the archons.

The conqueft of Meffenia gave Sparta the fuperiority over the rell of the ftates, excepting only that of Athens, which for a long time continued to be a very troublefome rival ; but the contefts between thefe two rival Rates have been fo fully related under the article A Trica, that nothing more is requifite to be added in the
place.-In the time of the Perfian war, Leonidas the Spartan king diftinguifhed himfelf in fuch a manner, as to become the admiration not only of that but of every fucceedins age. It being refolved in a general council to defend the ftraits of Thermopylæ againft. the Perfrans, 7000 s foot were put under the command of Leonidas ; of whom, however, only 300 were Spartans. Leonidas did not think it practicable to defend the pafs againft fuch multitudes as the Perfian king commanded; and therefore privately told his friends, that his defign was to devote himfelfs to death for his country.

Xerses advancing near the ftraits, was ftrangely fur prifed to find that the Greeks were refolved to difpute vol i. his paffage ; for he had always flattered himfelf, that on his approach they would betake themfelves to flight, and not attempt to oppofe his innumerable forces. However, Xerxes ftill entertaining fome hopes of their flight, waited four days without undertaking any thing, on purpofe to give them time to retreat. During this time, lie ufed his utmof endeavours to gain and corr!:pt Leonidas, promifing to make him mafter of all Greece if he would come over to his intereft. His offers being rejected with contempt and indignation, the king ordered him by an herald to deliver up his arms. Leonidas, in a ftyle and with a fpirit truly "laconical, anfwered, "Come thyfelf, and take them." Xerxes, at this reply, tranfported with rage, commanded the Medes and Ciffians to march againft them, take them all alive, and The \({ }^{3}\) bring them to him in fetters. The Medes, not able to fians rep ftand the fhock of the Greeks, foon betook themfelves fed with to flight : and in their room Hydarnes was ordered to great advance with that body which was called Immortal, and confifted of 10,000 chofen men; but when thefe came to clofe with the Greeks, they fucceeded no better than the Medes and Cifflans, bein obliged to retire with great flaughter. The next day the Perfians, reflecting on the fmall number of their enemies, and fuppofing fo many of them to be wounded that they could not porfibly maintain a fecond fight, refolved to make another attempt; but could not by any efforts make the Greeks give way: on the contrary, they were themfelves put to a thameful flight. The valour of the Greeks exerted itfelf on this occafion in a manner fo extraordinary, that Xerses is faid to have three times leaped from his throne, apprehending the entirc deftruction of his army.
Xerxes having loft all hopes of forcing his way through troops that were determined to conquer or die, was extremely perplexed and doubtful what mea. fures he frould take in this pofture of affairs; when one They are Epialtes, in expectation of a great reward, came to him, fhown a and difcovercd a fecret paffare to the top of the hill way over which overlooked and commanded the Spartan forces. furround The king immediately ordered Hydarnes thither with the Greel his felect body of 10,000 Perfians; who marching all night, arrived at break of day, and poffeffed themfelves of that advantageous poft. The Phocæans, who defended this pafs, being overpowered by the enemy's numbers, retired with precipitation to the very top of the mountain, prepared to die gallantly. But Hydarnes neglecting to purfue them, marched down the mountain with all poffible expedition, in order to attack thofe who defended the flraits in the rear. Leonidas being now apprifed that it was impoffible to bear up againft the enemy, obliged the reft of his allies to retire: but he ftaid himfelf, with the I'hefpians, Thebans, and 300

\section*{\(S\) P A}
arta. Lacedemonians, all refolved to die with their leader; who being told by the oracle, that either Sparta fhould be deftroyed or the king lofe his life, determined without the leaft hefitation to facrifice himfelf for his country. The Thebans indeed remaiued againft their inclination, being detained by Leonidas as hoftages; for they were fufpected to favour the Perfians. The Therpians, with their leader Demophilus, could not by any means be prevailed upon to abandon Leonidas and the Spartans. The augur Megitias, who had foretold the event of this enterprize, being preffed by Leonidas to retire, fent home his only fon ; but remained himfelf, and died by Leonidaa. Thofe who ftaid did not feed themfelves with any hopes of conquering or efcaping, but looked upon Thermopylx as their graves; and when Leonidas, exhorting them to take fome nourihment, faid, that they fhould all fup together with Pluto, with one accord they fet up a fhout of joy, as if they had been invited to a banquet.

Xerxes, after pouring out a libation at the rifing of the fun, began to move with the whole body of his army, as hic had been advifed by Epialtes. Upon their approach, Leonidas advanced to the broadeft part of the paffage, and fell upon the enemy with fuch undaunted courage and refolution, that the Perian officcrs were obliged to fland behind the divifions they commanded, in order to prevent the flight of their men. Great numbers of the enemy falling into the fea, were drowned; others were trampled under foot by their own men, and a great many killed by the Greeks; who knowing they could not avoid death upon the arrival of thofe who were advancing to fall upon their rear, exerted their utmoft efforts. In this action fell the brave Leonidas; which Abrocomes and Hyperanthes, two of the brothers of Xerxes, obferving, advanced with great refolution to feize his body, and carry it in triumph to Xerxes. But the Lacedemonians, more eager to defend it than their own lives, repulfed the enemy four times, killed both the brothers of Xerxes, with many otleer commanders of diftinction, and refcued the body of their beloved general out of the enemy's hards. But in the mean time, the army that was led by the treacherous Epialtes, advancing to attack their rear, they retired to the narroweft place of the paffage, and drawing all together except the Thebans, potted themfelves on a rifing ground. In this place they made head againft the Perians, who poured in upon them on all fides, till at length, not vanquifhed, but oppreffed and overwhelmed by numbers, they all fell, except one who efcaped to Spaita, where he was treated as a coward and traitor to his.country; but afterwards made a glorious reparation in the battle of Platæa, where he diftinguifhed himfelf in an extraordinary manner. Some time after, a magnificent monument was erected at Thermopylæ, in honour of thofe brave defenders of Greece, with two infcriptions; the one general, and relating to all thofe who died on this occafion, importing, that the Greeks of Pelopornefus, to the number only of 4000 , made head againft the Perfian army, confifting of \(3,000,000\). The other related to the Spartans in particular, and was compofed by the poet Simonides, to this purport: "Go, paffenger, and acquaint the Spartans that we died here in obedience to their juft commands." At thofe tombs a funeral oration was yearly pronounced in honour of the dead heroes, and public games performed with great folemnity,
wherein none but the Lacedemonians and Thefpians had any fhare, to fhow that they alone were concerned in the glorious defence of Thermopylx.

Sparta.
6
At the end of the 77 th Olympiad, a moft dreadful A dreadful earthquake happened at Sparta, in which, according to inthquatec Diodorus, 20,000 perfors loft their lives ; and Plutarch tells us, that only five houfes were left ftanding in the whole city. On this occation the Helotes or flaves, whom the Spartans had all along treated with the utmoot cruelty, attempted to revenge themfelves, by taking up arms, and marching directly to the ruins of the city, in hopes of cutting off at once thofe who had efcaped fiom the earthquake. But in this they were prevented by the prudence of the Spartan king Archidamus ; for he, obferving that the citizens were more defirous of preferving their effeets than taking care of their own lives, caufed an alarm to be founded, as if he had known that an enemy was at hanc. On this the citizens armed themfelves in hatte with fuch weapons as they conld come at ; and having marched a little way from the city, met the Helotes, whom they foon compelled to retire. The latter, however, knowing War with that they had now no mercy to expeet from thofe who the Helohad already treated them with fuch cruelty, refolved to tes. defend themfelves to the laft. Having therefore feized a fea-port town in Meffenia, they from thence made fuch incurfions into the Spartan territories, that they compelled thofe imperious matters to afk affiftance fron the Athenians. This was immediately granted ; but when the Spartans faw that the fkill of the Athenians in befieging towns was much greater than their own, they became jealous, and difmiffed their allies, telling them, that they had now no farther occafion for their fervices. On this the Athenians left them in difgurt; and as the Helotes and Meffenians did not choofe to come to an engagement with a Spartan army in the field, but took fhelter in their fortified places, the war was protracted for ten years and upwards. At laft the Helotes were reduced to their former mifery ; and the Meffenians were obliged to leave Peloponnefus, on pain of being made flaves alfo. Thefe poor people were then received by the Athenians, who granted them Nanpactus for their refidence, and afterwards brought them back to a part of their own country, from whence in the courfe of the Pelopounefian was they had driven the Spartans.
In the year 43 I B. C. the Peloponnefian war com. With the menced; of which a full account has becn given under And Perthe article Arrica, \(\mathrm{n}^{0} 116-165\). It ended moft un- fians. fortunately for the Athenians; their city being taken and difmantled, as related in the article above-mentioned. Thus were the Spartans raifed to the higheft pitch of glory; and, in the reign of Agefilaus, they feemed to be on the point of fubverting the Perlian empire, as related under the article PersiA, \(\mathrm{I}^{\circ}\) 34. But here theigood fortune and their views of empire were fuddenly checked. Agefilaus had carried on the war in Afia with the greatelt fuccefs; and as he would hearken to no terns of accommodation, a Perfian governor named Titbrayfles, having firt attempted in vain to bribe the king, diipatched Timocrates the Rhodian with 50 talents into Greece, in order to try whether he could there meet with any perfons lefs incorruptible than the Spartan monarch. This agent found many who inclio ned to accept his offers ; particularly in Thebes, Co-
rinth,

\section*{S P A}

\section*{combina.} tion againn §parta.
rinth, and Argos. By diftributing the money in a proper manner, he inflamed the inhabitants of thefe three cities againt the Spartans; and of all others the 'thebans came into his terms with the greateft readinefs. They faw that their antagoniifts would not of their own accord break with any of the ftates of Greece, and did not choofe to begin the war themfelves, becaufe the chiefs of the Perfian faction were unwilling to be accountable for the event. For this reafon they perfuaded the Locrians to invade a fmall diftrict which lay in difpute betwixt the Phocians and themfelves. On this the Phocians invaded Locris; the Locrians applied to the Thebans, and the Phocians to the Spartans. The latter were glad of an opportunity of breaking with the Thebans; but met with a much warmer reception than they expected. Their old general Lyfander, who had reduced Athens, was defeated and killed, with the lofs of 1000 men : on which difafter Agefilaus was recalled, and obliged to relinquiih all hopes of conquering the Perians. His return changed the fortune of the war fo much, that all the flates began to grow weary of a

10
Peace of
Antalcidas. conteft from which nobody derived any advantage except the king of Perfia. In a thort time a treaty was concluded, known in hiftory by the name of the peace of Antalcidas. The terms of this treaty were highly difadvantageous and difhonourable to the Greeks \(\wp\); for even the Spartans, though fuccefsful in Greece, had loft a great battle at fea with the Perfian fleet under Conon the Athenian, which entirely broke their power in Afia.

By the peace of Antalcidas, the government of Bocotia was taken from the Thebans, which they had for a long time enjoyed; and by this they were fo much provoked, that at firft they abfolutely refufed to accede to the treaty ; but as Agefilaus made great preparations to invade then, they thought proper at laft to comply. However, it was not long before a new war commenced, which threatened the total fubverfion of the Spartan flate. As, by the peace of Antalcidas, the king of Perfia had in a mianner guaranteed the fovereignty of Greece to Sparta, this republic very foon began to exercife its power to the utmoft extent. The Mantineans were the firlt who felt the weight of their refentment, although they had been their allies and confederates. In order to have a pretence for making war againft them, they commanded them to quit their city, and to retire into five old villages which, they faid, had ferved their forefathers, and where they would live in peace themfelves, and give no umbrage to their neighbours. This being refufed, an army was fent againft them to befiege their city. The fiege was continued through the fummer with very little fuccefs on the part of the Spartans; but having during the winter feafon dammed up the river on which the city ftood, the water rofe to fuich an height, as either to overflow or throw down the houfes; which compelled the Mantineans to fubmit to the terms prefcribed to them, and to retire into the old villages. The Spartan vengeance fell next on the Phliafians and Olynthians, whom they forced to come into fuch meafures as they thought proper. After this they fell on the Thebans; and, by attempting to feize on the Pireum, drew the Athenians afoo into the quarrel. But here their career was Ropped: the Thebans had been taught the art of war by Chabrias the Athenian ; fo that even Agecilaus himfelf took the command
of the Spartan army in vain. At fea they were defeated by Tlimotheus the fon of Conon; and by land the battle of Leuctra put an end to the fuperiority The po which Sparta had held over Greece for near 500 years. of Spar See Leuctra.

After this dreadful defeat, the Spartans had occafion broker to exert all their courage and refolution. The women and neareft relations of thofe who were killed in battle, inftead of fpending their time in lamentations, fhools each other by the hand, while the relations of thole who had efcaped fron the battle hid themfelves among the women; or if they were obliged to go abroad, they appeared in tattered clothes, with their arms folded, and their eyes fixed on the ground. It was a law among the Spartans, that fuch as fled from battle fhould be degraded from their honours, fhould be conftrained to appear in garments patched with divers celours, to wear their beards half-phaved, and to fuffer any to beat them who pleafed, without refiftance. At prefent, however,
this law was difpenfed with ; and An this law was difpenfed with; and Agefilaus by his prudent conduct kept up the fpirits of the people, at the fame time that by his fkill in military affairs he checked the progrefs of the enemy. Yet, during the lifetime of Epaminondas the Theban general, the war went on greatly to the difadvantage of the Spartans; but he being killed at the battle of Mantinea, all parties became quickly defirous of peace. A gefilaus did not long furvive ; and with him, we may fay, perihhed the glory of Sparta. Soon after this all the flates of Greece fell under the power of Alexander the Great; and the Spartans, as well as the relt, having become corrupt, and loft their martial \{pirit, became a prey to domeftic tyrants, and to foreign invaders. They maintained their ground, however, with great refolution againft the celebrated Pyrrhus king of Epirus; whom they repulfed for three days fucceffively, though not without affiftance from one of the captains of Antigonus. Eoon after this one of the kings of Sparta named Agis, perceiving the univerfal degeneracy that had taken place, made an attempt to rettore the laws and difcipline of Lycurgus, by which he fuppofed the flate would be reflored to its former glory. But though at firt he met with fome appearance of fuccefs, he was in a fhort time Cicomen tried and condemned by the ephori as a traitor to his atempt country. Cleomenes, however, who afcended the throne fiore it. in 216 B. C. accomplifhed the reformation which Ag is had attempted in vain. He fuppreffed the ephori ; can. celled all debts ; divided the lands equally, as they had been in the time of Lycurgus; and put an end to the luxury which prevailed among the citizens. But at laft he was overborne by the number of enemies which firrounded hin; and being defeated in battle by Antigonus, he fled to Egypt, where he put an end to his own life. With him perifhed every hope of retrieving the affairs of Sparta : the city for the prefent fell into the hands of Antigonus; after which a fucceffion of tyrants took \(\mathrm{F}^{\prime}\) ace ; till at laft all difturbances were ended by the Romans, who reduced Macedon and Greece to provinces of their empire, as has been related under
thefe articles.

It remains now only to fay fomething concersing the Innitution character, manners, and cuftoms of the Spattans, which, of \(L\), curt as they were founded on the laws of Lycurgus, may gus. beft be learned from a view of thefe laws.
The inftitutions of Lycurgus were divided into 12 .
tables,

\section*{S P A [ 653 ] S P A} nourable, and not attribute, as other nations did, noth and luxury to the gods. As to facrifices, they confifted of things of very fmall value; for which Lycurgus himfelf gave this reafon, That want might never hinder them from worhipping the gods. They were forbidden to make long or rafh prayers to the heavenly powers, and were injoined to ank no more than that they might live honefly and difclarge their duty. Graves were permitted to be made within the bounds of the city, contrary to the cuftom of moft of the Greek nations ; nay, they buried clofe by their temples, that all degrees of people might be made familiar with death, and not conceive it fuch a dreadful thing as it was sfenerally efteemed elfewhere : on the fame account, the touching of dead bodies, or affifting at funerals, made none unclean, but were held to be as innocent and honourable duties as any other. There was nothing thrown into the grave with the dead body; magnificent fepulchres were forbidden; neither was there fo much as an infcription, however plain or modeft, permitted. 'Tears, fighs, outcries, were not allowed in public, becaufe they were thought difhonourable in Spartans, whom their lawgiver would have to bear all things with equanimity. Mourning was limited to 11 days; on the 12 th the mourner facrificed to Ceres, and threw afide his weeds. In favour of fuch as were flain in the wars, however, and of women who devoted them. felves to a religious life, there was an exception allowed as to the rules before-mentioned ; for fuch had a fhot and decent infcription on their tombs. When a number of Spartans fell in battle, at a diftance from their country, many of them were buried together under one common tomb; but if they fell on the frontiers of their own ftate, then their bodies were carefully carried back to Sparta, and interred in their family-fepulchres.
II. Lycurgus divided all the country of Laconia into 30,000 equal fhares: the city of Sparta he divided into 9000 , as fome fay ; into 6000 , as others fay ; and, as a third party will have it, into 4500 . The intent of the legiflator was, that property fhould be equally divided amonglt his cieizens, fo that none might be powerful enough to opprefs his fellows, or any be in fuch neceffity, as to be therefrom in danger of corruption. With the fame view he forbade the biying or felling thefe poffeffions. If a franger acquired a right to any of thefe fhares, he might quietly enjoy it, provided he fubmitted to the laws of the republic. T'he city of Sparta was unwalied; Lycurgus truiting it rather to the virtue of its citizens than to the art of mafons. As to the houfes, they were very plail; for their ceilings could only be wrought by the axe, and their gates and doors only by the faw ; and their utenfils were to be of a like tamp, that luxury might have no inftruments among them.
III. The citizens were to be neither more nor lefs than the number of city-lots; and if at any time there bappened to be more, they were to be led out in colonies. As to children, their laws were equally hark and unreafonable; for a father was directed to carry his new-born infant to a certain place, where the gravelt
men of his tribe looked upon the infant; and if they perceived irs limbs ftraight, and thought it had a wholefome look, then they returned it to its parents to be educated; othervife it was thrown into a deep cavern at the foot of the mountain Taygetus. This law feems to have had one very good effect, viz. making women very carefut, when they were with child, of either eating, drinking, or exercifing, to excels : it made them alfo excellent nurfes; for which they were in mighty requeft throughout Greece. Strangers were not allowed to refide long in the city, that they might not corrupt the Spartans by teaching them new cuftoms. Citizens were alfo forbid to travel, for the fame reafon, unlefs the good of the fate required it. Such as were not bred up in their youth according to the law, were not allowed the liberty of the city, becaufe they held it unreafonable, that one who had not fubmitted to the laws in his youth fhould receive the benefit of them when a man. They never preferred any ftranger to a public office; but if at any time they had occalion for a perfon not born a Spartan, they firt made him a citizen, and then preterred him.

18
IV. Celibacy in men was infamous, and punithed in of celibacy a moft extraordinary manner ; for the old bachelor was and narconftrained to walk naked, in the depth of winter, riage. through the market-place : while he did this, he was obliged to fing a fong in difparagement of himfelf; and he had none of the honours paid him which otherwife belonged to old age, it being, held unreafonable, that the youth fhould venerate him who was refolved to leave none of his progeny behind him, to revere them when they grew old in their turn. The time of marriage was allo fixed ; and if a man did not marry when he was of full age, he was liable to an actiort; as were fuch alfo as married above or below themfelves. Such as had three children had great immunities; fuch as had four were free from all taxes whatfoever. Virgins were married without portions; becaufe neither want fould hinder a man, nor riches induce him, to marry contrary to his inclinations. When a marriage was agreed on, the hufband committed a kind of rape upon his bride. Hufbands went for a long time, fecretly and by ftealth, to the beds of their wives, that their love miyht not be quickly and eafily extinguifhed. Hußbands were allowed to lend their wives; but the kings were forbid to take this liberty. Some other laws of the like nature there were, which as they were evidently againt modefty, fo they were far from producing the end for which Lycurgus defigned them ; fince, though the men of Sparta were generally remarkable tor their virtue, the Spartan women were as generally decried for their boldnels and contempt of decency. very hirth, the Lacedemonians fhould be inured to of their conquer their appetites: for this reafon he directed, that nurfes thould accuftom their children to fpare meals, and now-and-then to falting; that they fhould carry them, when 12 or 13 years old, to thore who fhould examine their education, and who fhould carefully obferve whether they were able to be in the dark alone, and whether they had got over all other follies and weakneffes incident to children. He directed, that children of all ranks fhould be brought up in the fame way ; and that none flould be more favoured in food than another, that they might not, even in their infancy,

\section*{S P A \\ 54}

Greek and Roman authors cenfure as indecent. Gold, precious fones, and other coftly ornaments, were permitted only to common women; which permiffion was the ftronyeft prohibition to women of virtue, or who af fected to be thought virtuous. Virgins went abroad without veils, with which married women, on the contrary, were always covered. In certain public exercifes, in which girls were admitted as well as boys, they were both obliged to perform naked. Plutarch apologifes for this cuftom, urging, that there could be no danger from nakednefs to the morals of youth whofe minds were fortified and habituated to virtue. One of Lycurgus's principal views in his inftitutions, was to era. dicate the very feeds of civil diffenfion in his republic. Hence proceeded the equal divifion of eftates injoined by him ; hence the contempt of wealth, and the neglect of other diftinctions, as particularly birth, he confider. ing the people of his whole ftate as one great family; diftinctions which, in other cominonwealths, frequently produce tumults and confufions that fhake their very foundation.
VII. Though the Spartans were always free, yet it Obedienc was with this reftriction, that they were fublervient to to their rif their own laws, which bound them as ftrictly in the city periors. as foldiers, in other ftates, were bound by the rules of war in the camp. In the firft place, ftrict obedience to their fuperiors was the great thing required in Sparta. This they looked upon as the very bafis of government; without which neither laws nor magiftrates availed much. Old age was an indubitable title to honour in Sparta: to the old men the youth rofe up whenever they came into any public place; they gave way to them when they met them in the ftreets, and were filent whenever their elders fpoke. As all children were looked upon as the children of the ftate, fo all the old men had the authority of parents: they reprehended whatever they faw amifs, not only in their own, but in other people's children ; and by this method Lycurgus provided, that as youth are everywhere apt to offend, they might be nowhere without a monitor. The laws went fill further: if an old man was prefent where a young one committed a fault, and did not reprove him, he was punifhed equally with the delinquent. Amengtt the youths there was one of their own body, or at moft two years older than the reft, who was ftyled iren: he had authority to queftion all their actions, to look Atrictly to their behaviour, and to punifh them if they did amifs; neither were their punifhments light, but, on the contrary, very fevere; whereby the youth were made hardy, and accuttomed to bear tripes and rough ufage. Silence was a thing bighly commended at Sparta, where modefty was held to be a moft becoming virtue in young people; nor was it reftrained only to their words and actions, but to their very looks and geftures; Lycurgus having particularly directed, that they fhould look forward, or on the ground, and that they fhould always keep their hands within their robes. A ftupid inconfiderate perfon, one who would not liften to inftruction, but was carelefs of whatever the world might fay of him, the Lacedemonians treated as a fcandal to human nature; with fuch an one they would not converfe, but threw him off as a rotten branch and worthlefs member of fociety.
VIII. The plainnefs of their manners, and their 22 ing fo very much addicted to war, made the Lacedes monians

\section*{9 P A}
monians lefs fond of the fciences than the reft of the Greeks. A foldier was the only reputable profeffion in Sparta; a mechanic or hufbandman was thought a low'fellow. 'The realon of this was, that they imazgined profeffions which required much labour, fome conftant pofture, beine continually in the houfe, or always about a fire, weakened the body and depreffed the mind: whereas a man brought up hardily, was equally fit to attend the fervice of the republic in time of peace, and to fight its battles when encraged in war. Such occupations as were neceffary to be followed for the benefit of the whole, as hubandry, agriculture, and the like, were left to their flaves the Helotes; but for curious arts, and fuch as ferved only to luxiry, they would not fo much as fuffer them to be introduced in their city; in confequence of which, rhetoricians, augurs, bankers, and dealers in money, were fhut out. The Spartans admitted not any of the theatrical diverfions among them ; they would not bear the reprefentation of evil even to produce good; but other kinds of poetry were admitted, provided the magiftrates had the perufal of pieces before they were handed to the public.

Above all things, they affected brevity of fpeech, and accultomed their children, from their very infancy, never to exprefs themfelves in more words than "were ftrictly neceffary; whence a concife and fententious oratory is to this day ftyled Laconic. In writing they ufed the fame concifenefs; of which we have a fignal inftance in a letter of Archidamus to the Eleans, when he underfond that they had fome thoughts of affifting the Arcadians. It ran thus: "Archidamus to the Eleans: It is good to be quiet." And therefore Epaminondas thourht that he had reafon to glory in having forced the Spartans to abandon their monofyllables, and to lengthen their difcourfes.
.The greateft part of their education confifted in giving their youth right ideas of men and things : the iren or mafter propofed queftions, and either commended the anfwers that were made him, or reproved fuch as anfwered weakly. In thefe queftions, all matters, either of a trivial or abftrufe nature, were equally avoided; and they were confined to fuch points as were of the ligheft importance in civil life; fuch as, Who was the bett man in the city? Wherein lay the merit of fuch an action? and, Whether this or that hero's fame was well-founded? Harmlefs raillery was greatly encouraged; and this, joined to their fhort manner of fpeaking, rendered laconic replies univerfally admired. ©

Mufic was much encouraged; but in this, as in other things, they adhered to that which had been in favour with their anceftors; nay, they were fo ftrict therein, that they would not permit their haves to learn either the tune or the words of their moft admired odes; or, which is all one, they would not permit them to fing them if they had learned them. Thongh the youth of the male fex were nuch cherifhed and beloved, as thofe. that were to build up and continue the fiture glory of the flate, yet in Sparta it was a virtuous and modeft affection, untinged with that fenfuality which was fo fcandalous.at Athens. The good effects of this part of Lycurgus's inititutions were feen. in the union that reigned among his citizens; and which was fo extra. ordinary, that even in cafes of competition, it was hardly known that rivals bore ill-will to each other ; but,

\section*{55 ] S P A}
on the contrary, their love to the fame perfor begat a fecondary friendinip among themfelves, and united them in all things which might be for the benetit of the perfon beloved.

Some authors have accufed this great lawgiver of en. couraging theft in his inftitutions; which, they fay, was not held fcandalous among the Spartans, if it were fo dexteroufly manared as that the perfon was not detected in it. But this is certain, and feems to be a ftrong contradiction of the heinous charge, that when a theft was difcovered, it was punifhed with the utmoft feverity: a perfon even fufpected of it would endure the heavieft punifhments rather than acknowledge it, and be branded with fo bafe a crime.
IX. The exercifes inftituted by law fall under the \(\operatorname{Exerctes}^{2} 3\) ninth table. In thefe all the Greeks were extremely careful, but the Lacedemonians in a degree beyond the reft; for if a youth, by his corpulence, or any other means, became unfit for thefe exercifes, he underwent public contempt at leaft, if not banifhment.Hunting was the ufual diverfion of their children; nay, it was made a part of their education, becaufe it had a tendency to ftrengthen their limbs, and to render thofe who practifed it fupple and fleet: they likewife bred up dogs for hunting with gieat care. They had a kind of public dances, in which they exceedingly delighted, and which were common alike to virgins and young men : indeed, in all their fports, girls were allowed to divert themfelves with the youths; infomuch that, at darting, throwing the quoit, pitching the bar, and fucl-like robuft diverfions, the women were as dexterous as the men. For the manifeft oddity of this proceeding, Lycurgus affigned no other reafon, than that he fought'to render women, 'as well as men, ftrong and healthy, that the children they brought forth might be fo too. Violent exercifes, and a laborious kird oflife, were only enjoined the youth; for when they were grown up to meris effate, that is, were upwards of 30 years old, they were exempted from all kinds of labour, and employed themfelves wholly either in affairs of ftate or in war. - They lad a method of whipping, at a certain time, young men in the temple of Diana, and about her altar ; which, however palliated, was certainly unnatural and cruel. It was effeemed a great honour to furtain thefe flagellations without weeping, groaning, or fhowing any fenfe of pain; and the thirt of glory was fo flrong in thefe young minds, that they very frequently fuffered death without fhedding a tear or breathing a figh. . A defire of overcoming all the weaknefles of human nature, and thereby rendering his Spartans not only fuperior to their neighbours, but to their fpecies, runs through many of the inftitutions of Lycurgus; which principle, if well attended to, thoroughly explains them, and without atteriding to which it is impoffible to give any account of them at all.
X. Gold and Gilver were; by the confitutions of Money, \({ }^{24}\) Lycurgus, made of no value in Sparta: . He was fo \(\& \mathrm{c}\). well apprized of the danger of riches, that he made the very poffeffion of them venal ; but as there was no 1 i ving without fume furt of money, that is, fome common meafure or ftandard of the worth of things, he directed an iron coinage, whereby the Spartans were fupplied with the ufeful money, and at the fame time had no temptation to covetoufnefs afforded them; for a very fmall fum was fufficient to load a couple of horfes, and.j.

\section*{\(S\) P A}
a great one muft have been kept in a barn or warehoufe. 'The coming in of all foreign money was alfo prohibited, that corruption might not enter nnder the name of commerce. The moft ancient method of dealing, viz. by barter, or exchange of one commodity for another, was preferved by law in Sparta long after it had been out of date everywhere elfe. Intereft was a thing forbidden in the Spartan commonwealth; where they had alfo a law againft alienation of lands, accepting prefents from foreigners, even without the limits of their own country, and when their authority and character might well feem to excufe them.
XI. Such of the laws of Sparta as related to courts of jufice may be brought under the ith table. Thirty years mult have paffed over the head of him who had a right to concern hinfelf in juridical proceedings. Young men were thought unfit for them; and it was even held indecent, and of ill report, for a man to have any fondnefs for law-fuits, or to be bufying himfelf at the tribunals, when he had no affairs there of his own. By thefe rules Lycurgus thought to flut out litigioufnefs, and to prevent that multiplicity of fuits which is always fcandalous in a ftate. As young people were not permitted to inquire about the laws of other countries, and as they were hindered from hearing judicial proceedings in their courts, fo they were likewife forbidden to afk any queltions about, or to endeavour to difcover, the reafons of the laws by which themfelves were governed. Obedience was their duty; and to that alone they would have them kept. Men of abandoned characters, or who were notorioufly of ill fame, loft all right of giving their votes in refpect of public affairs, or of fpeaking in public affemblies; for they would not believe that an ill man in private life could mean his country better than he did his neigh. bour.

XIl. Till a man was 30 years old, he was not capable of ferving in the army, as the beft authors agree ; though fome think that the military age is not well afcertained by ancient writers. - They were forbidden to march at any time before the full-moon; the reafon of which law is very hard to be difcovered, if indeed it had any reafon at all, or was not rather founded on fome fuperftitious upinion, that this was a more lucky conjuncture than any other. 'They were likewife forbidden to fight often againft the fame enemy; which was one of the wifeft maxims in the political fyftem of Lycurgus: and Agefilaus, by offending againft it, deftroyed the power of his country, and loft her that authority which for many ages the maintained over the reft of Greece ; for, by continually warsing againft the Thebans, to whom he had an inveterate hatred, he at laft beat them into the knowledge of the art of war, and enabled them, under the command of Epaminondas, to maintain for a time the prin. cipality of Greece. Maritime affairs they were forbidden to meddle with, though the neceffity of things compelled them, in procefs of time, to tranfgrefs this inftitution, and by degrees to transfer to themftlves the dominion of the fea as well as of the land: but, after the Peloponnefian war, they again neglected naval :ffairs, from a perfuafion that fallors and ferangers corrupted thofe with whom they converfed. As they never fortified Sparta, they were not ready to undertake fieges : fighting in the field was their proper province, and, while they
could overcome their enemies there, they rightly con. ceived that nothing could hurt them at home. In time of war, they relaxed fomewhat of their ftrict manner of living, in which they were fingular. 'The true reafon for this was, in all probability, that war might be lefs burdenfome to them; for, as we have more than once obferved, a ftrong defire to render them bold and warlike was the reigning paffion of their legiflator. They were forbidden to remain long encamped in the fame place, as well to hinder their being furprifed, as that they might be more troublefome to their enemies, by wafting every corner of their country. They flept all night in their armour ; but their ontguards were not allowed their fhields, that, being unprovided of defence, they might not dare to fleep. In all expeditions they were careful in the performance of religious rites; and, after their evening-meal was over, the foldiers fung together hymns to their gods." When they were about to engage, the king facrificed to the mufes, that, by their affitance, they might be enabled to perform deeds worthy of being recorded to lateft times. Then the army advanced in order to the found of flutes, which played the hymn of Caftor. The king himfelf fung the pran, which was the fignal to charge. This was done with all the folemnity imaginable; and the foldiers were fure either to die or conquer : indeed they had no other choice; for if they fled they were infamous, and in danger of being flain, even by their own mothers, for difgracing their families. In this confifted all the excellency of the Spartan women, who, if poffible, exceeded in bravery the men, never lamenting over hufbands or fons, if they died lonourably in the field; but deploring the thame brought on their houfe, if either the one or the other efcaped by llight. The throwing away a fhield alfo induced infamy; and, with refpect to this, mothers, when they embraced their departing fons, were wont to caution them, that they fhould either retum armed as they were, or be brouglit back fo when they were dead; for, as we have obferved, fuch as were flain in battle were neverthelefs buried in their own country. When they made their enemies fly, they purfued no longer than till victory was certain ; becaufe they would feem to fight rather for the honour of conquering, than of putting their encmies to death. According to their excellent rules of war, they were bound not to fpoil the dead bodies of their enemies ; but in procefs of time, this, and indeed many other of their moft excellent regulations, fell inta defuetude. He who overcame by ftratagem, offiered up an ox to Mars; whereas he who conquered by force, offered up only a cock; the former being efteemed more manly than the latter. After 40 years fervice, a man was, by law, no longer required to go into the field; and confequently, if the military age was \(30_{0}\) the Spartans were not held invalids till they were 70.

SPARTIANUS (Elius), a Latin hiftorian, who wrote the lives of Adrian, Caracalla, and four other Roman emperors. He lived under the reign of Dioclefian, about the year 290.

SPAR'IIUM, Broom, in botany : A genus of plants belonging to the clafs of diadelpbia, and order of decandria; and in the natural fyftem arranged under the 32 d order, Papilionacea. The ftigma is longitudinal and woolly above : the filaments adhere to the germen. The calyx is produced downwards. There are 16 fpecies, 6
tbe

\section*{\(S \quad P \quad A\)}
[ 657 ] S P A
the fcoparium, contaminatum, fepiarium, junceum, monofpermum, fphœrocarpon, purgans, aphyllum, fcorpius, angulatum, patens, fupranulium, complicatum, radiatum, cytifoides, and fpinofum. All thefe, except the fcoparium, are exotics, chiefly from Spain, Portugal, Italy, \&c.The fooparium, or common broom, has ternate folitary leaves ; the branches angular, and without prickles.

Ufes. The common broom is ufed for a variety of purpofes. It has been of great benefit fometimes in dropfical complaints. The manner in which Dr Cullen adminiftered it was this: He ordered half an ounce of freth broom tops to be boiled in a pound of water till one half of the water was evaporated. He then gave two table-fpoonfuls of the decoction every hour till it operated both by ftool and urine. By repeating thefe dofes every day, or every fecond day, he fays fome dropfies have been cured. Dr Mead relates, that a dropfical patient, who had taken the ufual remedies, and been tapped three times without effect, was cured by taking half a pint of the decoction of green broom tops, with a fpoonful of whole muftard feed every morning and evening. "An infufion of the feeds drunk freely (fays Mr Wi thering) has been known to produce fimilar happy ef. fects; but whoever expects thefe effects to follow in every dropfical cafe, will be greatly deceived. I knew them fucceed in one cafe that was truly deplorable; but out of a great number of cafes in which the medicine had a fair trial, this proved a fingle inftance."

The flower buds are in fome countries pickled, and eaten as capers; and the feeds have been ufed as a bad fubftitute for coffee. The branches are ufed for making befoms, and tanning leather. 'They are alfo ufed inftead of thatch to cover houfes. The old wood furnifhes the cabinet-maker with beautiful materials for vaneering. The tender branches are in fome places mixed with hops for brewing, and the macerated bark may be manufactured into cloth.
The junceum, or Spanifh broom, grows naturally in the fouthern provinces of France, as well as other parts of the fouth of Europe. It grows in the pooreft foils, on the fteepeft declivities of the hills, in a ftony foil, where hardly any other plant could vegetate. In a few years it makes a vigorous fhrub; infinuating its roots between the interfices of the ftones, it binds the foil, and retains the fmall portion of vegetable earth fcattered over thefe hills, which the autumnal rains would otherwife wafh away. It is moft eafily raifed from feed, which is ufually fown in January, after the ground has received a flight dreffing.

This Chrub ferves two ufeful purpofes. Its branches yield a thread of which linen is made, and in winter fupport fheep and goats.

In manufacturing thread from broom, the youngeft plants are cut in the month of Auguft, or after har veft, and gathered together in bundles, which at firft are laid in the fun to dry: they are then beaten with a piece of wood, wathed in a river or pond, and left to fleep in the water for about four hours. The bundles thus prepared are taken to a little diftance from the water, and laid in a hollow place made for them, where they are covered with fern or ftraw, and remain thus to fteep for eight or nine days; during which time, all that is neceffary, is to throw a little water once a-day on the heap, without uncovering the broom. After this, the bundles are well wafhed, the green rind of the plant or

Vol. XVII. Part II.
epidermis comes off, and the fibrous part remains ; each \(\mathrm{S}_{\mathrm{i}} \mathrm{a}\)-tium, bundle is then beaten with a wooden hammer upon a \(\qquad\) ftorie, to detach all the threads, which are at the fame time carefully drawn to the extremity of the branches. After this operation, the faggots are untied, and fpread upon ftones or rocks till they are dry. The twigs mult not be peeled till they are perfectly dry ; they are then dreffed with the comb, and the threads are feparated according to their fineneis, and fpun upon a wheel.

The linen made of this thread ferves various purpofes in rural economy. The coarfeft is employed in making facks and other ftrong cloths for carrying grain or feeds. Of the fineft is made bed, table, and body linen. The peafants in feveral places ufe no other, for they are unacquainted with the culture of hemp or flax, their foil being too dry and too barren for raifing them. The cloth made with the thread of the broom is very ufeful; it is as foft as that made of hemp; and it would perhaps look as well as that made of flax if it was more carefully fpun. It becomes white in proportion as it is Aeeped. The price of the fineft thread, when it is fold, which feldom happens, is generally about a fhilling a-pound.

The other ufe to which this broom is applied, is to maintain fheep and goats during winter. In the mountains of Lower Languedoc thefe animals have no other food from November to A pril, except the leaves of trees preferved. The branches of this broom therefore are a refource the more precious, that it is the only frefh nourifhment which at that feafon the flocks can procure, and they prefer it at all times to every other plant. In fine weather the fheep are led out to feed on the broom where it grows; but in bad weather the fhepherds cut the branches, and bring them to the fheep-folds. There is, however, an inconvenience attending the continued - ufe of this food. It generally produces inflammation in the urinary paffages. But this inconvenience is eafily removed by cooling drink, or a change of food, or by mixing the broom with fomething elfe.

It is perhaps needlefs to add, that it differs much from the broom that is common everywhere in the north of Europe, though this too, in many places, is ufed for food to cattle. Both of them produce flowers that are very much reforted to by bees, as they contain a great quantity of honey juice. And this fhould be another inducement to the cultivation of the Spanifh bioom.

SPARUS, Gilthead, in natural hifory; a genus of animals belonging to the clafs of pifces, and the order of thoracici. The fore-teeth and dog-teeth are very ftrong; the grinders are obtufe and thick fet ; the lips are folded over; there are five rays in the gill membrane; and the opercula are fcaly : the body is compreffed ; the lateral line is crooked behind ; and the pectoral fins are roundifh.

Gmelin enumerates 39 fpecies, of which only three are found in the Britifh feas, the pagrus, auratus, and dentatus. 1. The pagrus, or fea-bream, is of a reddifh colour. The fkin forms a finus at the roots of the dorfal and anal fins. 'The body is broad; the back and belly ridged. There is only one dorfal fin. 2. The auratus, or gilt-bream. The head and fides of it are gilt, and there is a golden fpot between the eyes fhaped like a half-moon ; there is alfo a black purple fpot on the gills; and it weighs from cight lb . to ten lb. It is one 40 of

\section*{\(\mathbf{S} \mathbf{P}\) E [ 658\(] \quad\) S P E}

Opafm of the pijces faxatiles, or finh that haunts deep waters on bold rocky fhores. They feed chiefly on fhell-fifh, which they comminute with their teeth before they
fwallow; the teeth of this genus in particular being adapred for that purpofe: the grinders are flat and Atrong, like thofe of certain quadrupeds: befides which there are certain bones in the lower part of the mouth that affift in grinding their food. They are but a coarfe fifh : they were known to the Romans, who did not efteem them unlefs they were fed with Lucrine oyAers, as Martial informs us,

Non omnis laudem pretiumque Avraqa meretur,
Sed qui Jolus erit concha Lucrina cibus.
Lib. xiii. Ep. go.
3. The dentatus, toothed fea-bream, is black above, and of a filvery appearance below. The eyes and gills are very large. There are nine rows of teeth in the lower jaw, and one in the upper.

In the account of Captain Cook's voyage publifhed by Mr Forter, we are informed, that the giltheads are fometimes poifonous, owing to their feeding on certain fpecies of the raja, which have an extremely acrid and ttimulating property.

SPASM, a convulfion. See Medicine, n \({ }^{\bullet} 278\).
SPATHA, in botany, a fheath; a fpecies of calyx which burfts lengthwife, and protrudes a ftalk fupporting one or more flowers, which cominonly have no perianthium or flower-cup.

SPATHACE \(\mathbb{E}\) (from fpatia, " a fheath"), the name of the sinth order in Linnæus's Fragments of a Natural Method confifting of plants whofe flowers are protruded from a fpatka or sheath. See Botany, p. 458.

SPATHELIA, in botany; a genus of plants belonging to the clafs of pentandria, and to the order of trigynia. The calyx is pentaphyllous; the petals are five; the capfule is three-edged and trilocular ; the feeds folitary. There is only one fpecies, the fimplex, which is a native of Jamaica, and was introduced into the botanic gardens of this country in 1778 by Dr Wright, late of Jamaica.

\section*{SPAW. See SPA.}

SPAWN, in natural hiftory, the eggs of fifhes or frogs. See Fish and Rana.

SPAVEN IO. See Scanto.
SPAVIN, in the manege, a difeafe in horfes, being a fwelling or ftiffnefs, ufually in the han, occafioning a lamenels. See Farriery, \(\$ 29\).

SPAYING, or Spading, the operation of caftrating the females of feveral kinds of animals, as fows, bitches, \&c. to prevent any further conception, and promote their fattening. It is performed by cutting them in the mid flank, on the left fide, with a tharp knife or lancet, taking out the uterus, and cutting it off, and fo ftitching up the wound, anointing the part with tar, and keeping the animal warm for two or three days. The ufual way is to make the incifion aflope, two inches and a half long; that the fore-finger may be put in towards the back, to feel for the ovaries, which are two kernels as big as acorns on both fides of the uterus, one of which is drawn to the wound, and thus both taken out.

SPEAKER of the Houfe of Commons, a member of she houfe elected by a majority of votes thereof to act
as chairman or prefident in putting queftions, reading Speakin briefs, or bills, keeping order, reprimanding the refractory, adjourning the houfe, \&c. Sce Parliament.

SPEAKING, the art or act of expreffing one's thoughts in articulate founds or words. See Gram. mar, Language, Reading, and Oratory, Hart iv. Spabing-Trumpet. See T'rumpet.
SPEAR-Mint, in botany. See Mentha.
Spear-Wort. See Ranunculus.
SPECIAL, fomething that is particular, or has a particular defignation; from the Latin \(\sqrt{p}\) pcies, in oppofition to the general, from genus.

SPECIES, in logic, a relative term, expreffing an idea which is comprifed under fome general one called a genus. See Logic, \(\mathrm{n}^{\circ} 68\).
SPEC1ES, in commerce, the feveral pieces of gold, filver, copper, \&c. which having paffed their full preparation and coinage, are current is public. See Money.

SPECIFIC, in philofophy, that which is peculiar to any thing, and dittinguifhes it from all others.

SPECLFICS, in medicine. By fpecifics is not meant fuch as infallibly and in all patients produce falutary effects. Such medicines are not to be expected, becaufe the operations and effects of remedies are. not formally inherent in them, but depend upon the mutual action and reaction of the body and medicine upon each other ; hence the various effects of the fame medicine in the fame kind of diforders in different patients, and in the fame patient at difierent times. By fpecitic medicines we undertand fuch medicines as are more infallible than any other in any particular difo order.

SPRCIFIC Gravity, is a term much employed in the difcuffions of modern phyfics. It expreffes the weight of any particular kind of matter, as compared with the weight of the fame bulk of fome other body of which the weight is fuppofed to be familiarly known, and is therefore taken for the fandard of comparifon. The body generally made ufe of for this purpofe is pure water. See Hydrostatics, Seet. III.

The fpecific gravity of bodies is a very interefting queftion both to the philofopher and to the man of bufinefs. The philofopher confiders the weights of bodiee as meafures of the number of material atoms, or the quantity of matter which they contain. This he does on the fuppofition that every atom of matter is of the fame weight, whatever may be its fenfible form. 'This' fuppofition, however, is made by him with caution, and he has recourfe to fpecific gravity for afcertaining its. truth in various ways. This thall be confldered by and by. 'I'he man of bufinefs entertains no doubt of the matter, and proceeds on it as a fure guide in his moft interefting tranfactions. We meafure commodities of various kinds by tons, pounds, and ounces, in the fame manner as we meafure them by yards, feet, and inches, or by bufhels, gallons, and pints; nay, we do this with. much greater confidence, and prefer this meafurement to all others, whenever we are much interefted to know. the exact propurtions of matter that bodics contain. The weight of a quantity of grain is allowed to inform us much more exactly of its real quantity of ufeful matter than the molt accurate meafure of its bulk. We fee many circumftances which can vary the bulk of a quantity of matterg and thefe are frequently fuch as we caro

\section*{\(S\) PE \\ 659 ] \\ \(S\) PE}
pecific not regulate ar prevent ; but we know very few indeed tavity. that can make any fenfible change in this weight with-
out the addition or abtraction of other matter. Even taking it to the fummit of a high mountain, or from the equator to the polar region, will make no change in its weight as it is afcertained by the balance, becaufe there is the fame real diminution of weight in the pounds and ounces ufed in the examination.

Notwithftanding the unavoidable change which heat and cold make in the bulk of bodies, and the permanent varieties of the fame kind of matter which are cauled by different circumftances of growth, texture, \&c. moft kinds of inatter have a certain conftancy in the denfity of their particles, and therefore in the weight of a given bulk. Thus the purity of gold, and its degree of adulteration, may be inferred from its weight, it being purer in proportion as it is more denfe. The denfity, there\{ore, of different kinds of tangible matter becomes characteriftic of the kind, and a teft of its purity; it marks a particular appearance in which matter exilts, and may therefore be called, with propriety, Specific.

But this denfity cannot be directly obferved. It is not by comparing the diftances between the atoms of matter in gold and in water that we fay the firft is 19 simes denfer than the laft, and that an inch of gold contains ig times as many material atoms as an inch of water ; we reckon on the equal gravitation of every atom of matter whether of gold or of water ; therefore the weight of any body becomes the indication of its material denfity, and the weight of a given bulk becomes fecific of that kind of matter, marking its kind, and even afcertaining its purity in this form.

It is evident that, in order to make this comparifon of general ufe, the ftandard mult be familiarly-known, and must be very uniform in its denfity, and the comparifon of bulk and denfity muft be eafy and accurate. The moit obvious method would be to form, with all nicety, a piece of the ftandard matter of fome convenient bulk, and to weigh it very exactly, and keep a note of its weight: then, to make the comparifon of any other fubftance, it muft be made into a mafs of the fame precife bulk, and weighed with equal care ; and the mott convenient way of expreffing the fpecific gravity would be to confider the weight of the ftandard as unity, and then the number expreffing the fpecific gravity is the number of times that the weight of the ftandard is contained in that of the other fubftance. This comparifon is moft eafily and accurately made in fluids. We have only to make a veffel of known dimenfions equal to that of the ftandard which we employ, and to weigh it when empty, and then when filled with the fluid. Nay, the moft difficult part of the procefs, the making a veffel of the precife dimenfions of the ftandard, máy be avoided, by uling fome fluid fubtance for a ftandard. Any veffel will then do; and we may enfure very great accuracy by ufing a veffel with a flender neck, fuch as a phial or matrals; for when this is filled to a certain mark in the neck, any error in the eftimation by the eye will bear a very fmall proportion to the whole. "The weight of the fandard fluid which fills it to this mark being carefully afcertained, is kept in remembrance. The Epecific gravity of any other fluid is had by weighing the contents of this veffel when filled with it, ard dividing: the weight ly the weight of the fandard. The quotent is the fpecific gravity of the fluid. But in all other
cafes this is a very difficult problem: it requires very nice hands, and an accurate eye, to make two bodies of the fame bulk. An error of one hundredth part in the linear dimenfions of a fulid body makes an error of a 3 oth part in its bulk; and bodies of irregular fhapes and friable fubftance, fuch as the ores of metals, cannot be brought into convenient and exact dimenfions for meafurement.

From all thefe inconveniences and difficulties we are freed by the celebrated Archimedes, who, from the principles of hydroftatics difcovered or eftablifhed by him, deduced the accurate and eafy method which is now univerfally practifed for difcovering the fecific gravity and denfity of bodics. (See Archimedes and Hydrostatics, \(n^{\circ}\) 11.) Inftead of meafiring the bulk of the body by that of the difplaced fluid (which would have been impoffible for Archimedes to do with any thing like the neceffary precifion), we have only to obo ferve the lofs of weight fuftained by the folid. This can be done with great eafe and exactnefs. Whatever may be the bulk of the body, this lofs of weight is the weight of an equal bulk of the fluid; and we obtain the fpecific gravity of the body by fimply dividing its whole weight by the weight loft : the quotient is the fpecific gravity when this fluid is taken for the fandard, even though we fhould not know the abfolute weight of any given bulk of this ftandard. It alfo gives us an eafy and accurate method of afcertaining even this fundamental point. We have only to form any folid body into an exact cube, fphere, or prifm, of known dimenfions, and obferve what weight it lofes when immerfed in this ftandard fluid. 'lhis is the weight of the fame bulk of the ftandard to be kept in remembrance; and thus we obtain, by the by, a mof eafy and accurate method for meafuring the bulk or folid contents of any body, however irregular its fhape may be. We have only to fee how much weight it lofes in the ftandard fluid; we can compute what quantity of the ftandard fluid will have this weight. 'Thus fould we find that a quantity of fand, or a furze bufh, lofes 250 ounces when inmerfed in pure water, we learn by this that the folid meafure of every grain of the fand, or of every twig and prickle of the furze, whon added into one fum, amounts to the fourth part of a cubic foot, or to \(43^{2}\) cubic inches.

To all thefe advantages of the Archimedean method of afcertaining the fpecific gravity of bodies, derived from his hydroftatical doctrines and difcoveries, we may add, that the immediate ftandard of comparifon, namely, water, is, of all the fubftances that we know, the fittelt for the purpofe of an univerfal ftandard of reference. In its ordiary natural ftate it is fufficiently conftant and uniform in its weight for every examination where the utmoft mathematical accuracy is not wanted; all its variations arife from impurities, from which it may at all times be feparated by the fimple procefs of diftillation : and we have every reafon to think that when pure, its denfity, when of the fame temperature, is invariable.

Water is therefore univerfally taken for the unit of that fcale on which we meafure the fpecific gravity of bodies, and its weight is called 1. The fpecific gravity of any other body is the real weiglit in pounds and ounces, when of the bulk of one pound or one ounce of water. It is therefore of the firft importance, in all
dif.

Speeife Gravity

\section*{S P E}

Specific Gravity.
difcuffions refpecting the \{pecific gravity of bodies, to have the precife weight of fome known bulk of pure water. We have taken fome pains to examine and compare the experiments on this fubject, and fhall endeavour to afcertain this point with the precifion which it deferves. We fhall reduce all to the Englifh cubic foot and avoirdupois ounce of the Exchequer ftandard, on account of a very convenient circumftance peculiar to this unit, viz. that a cubic foot contains almolt precifely a thoufand ounces of pure water, fo that the fpecific gravity of bodies expreffes the number of fuch ounces contained in a cubic foot.
We begin with a trial made before the houfe of commons in 1696 by Mr Everard. He weighed 2145,6 cubic inches of water by a balance, which turned fenfibly with 6 grains, when there were 30 pounds in each fcale. The weights employed were the troy weights, in the depofit of the Court of Exchequer, which are ftill preferved, and have been moft fcrupulouny examised and compared with each other. The weight was 1131 aunces 14 pennyweights. This wants juft is grains of a thoufand avoirdupois ounces for 1728 cubic inches, or a cubic foot; and it would have amounted to that weight had it been a degree or two colder. The temperature indeed is not mentioned; but as the trial was made in a comfortable room, we may prefume the temperature to have been about \(55^{\circ}\) of Fahrenheit's thermometer. The dimenfions of the veffel were as accurate as the nice hand of Mr Abraham Sharp, Mr Flamfead's affiftant ar Greenwich, could execute, and it was made by the Exchequer ftandard of length.

This is confided in by the naturalifts of Europe as a very accurate ftandard experiment, and it is confirmed by many others both private and public. The ftandards of weipht and capacity employed in the experiment are fill in exiftence, and publicly known, by the report of the Royal Society to parliament in 1742, and by the report of a committee of the houfe of commons in 1758 . This gives it a fuperiority over all the meafures which have come to our knowledge.

The firft experiment, made with proper attention, that we meet with, is by the celebrated Snellius, about the year 1615 , and related in his Eratofhenes Batavus. He weighed a Rhinland cubic foot of diftilled water, and found it 62,79 Amfterdam pounds. If this was, the ordinary weight of the fhops, containing 7626 Eng. lifh troy grains, the Englif cubic foot muft be 62 pounds 9 ounces, only one ounce more than by Everard's experiment. If it was the Mint pound, the weight was 62 pounds 6 ounces. The only other trials which can come into competition with Mr Everard's are fome made by the A cademy of Sciences at Paris. Picart, in 1691 , found the Paris cubic foot of the water of the fountain d'Arcueil to weigh 69,588 pounds poids de Paris. DuHamel obtained the very fame refult ; but Mr Monge, in 1783 , fays that filtered rain-water of the temperature \(12^{\circ}\) (Reaumur) weighs 69,3792 . Both thefe meafures are confiderably below Mr Everard's, which is 62,5 , the former giving 62,053 , and the latter 61,868. M. Lavoifier ftates the Paris cubic foot at 70 pounds, which makes the Eng:I I foot 62,47. But there is an inconfiftency among them which makes the comparifon impofible. Some changes were made in

\section*{6601 \\ S P E}

1688, by royal authority, in the national ftandards, both of weight and length; and the academicians are exccedingly puzzled to this day in reconciling the differences, and cannot even alcertain with perfect affurance the lineal meafures which were employed in their moft boafted geodetical operations.

Such variations in the meafurements made by perfons of reputation for judgment and accuracy engaged the writer of this article fome years ago to attempt another. A veffel was made of a cylindrical form, as being more eafily executed with accuracy, whofe height and diameter were 6 inches, taken from a moft accurate copy of the Exchequer ftandard. It was weighed in diftilled water of the temperature \(55^{\circ}\) feveral times without varying 2 grains, and it loft 42895 grains. This gives for the cubic foot 998,74 ounces, deficient from Mr Everard's an ounce and a quarter; a difference which may be expected, fince Mr Everard ufed the New River water without diftillation.

We hope that thefe obfervations will not be thought fuperfluous in a matter of fuch continual reference, in the moft interefting queftions both to the philofopher and the man of bufinefs; and that the determination which we have given will be confidered as fufficiently authenticated.

Let us, therefore, for the future take water for the ftandard, and fuppofe that, when of the ordinary temperature of fummer, and in its fate of greateft natural pu. rity, viz. in clean rain or fnow, an Englifh cubic foot of it weighs a thoufand avoirdupois ounces of 437,5 troy grains each. Divide the weight of any body by the weight of an equal bulk of water, the quotient is the fpecific gravity of that body; and if the three firft figures of the decimal be accounted integers, the quo. tient is the number of avoirdupois ounces in a cubic foot of the body. Thus the Ipecific gravity of the very fineft gold which the refiner can produce is 19,365 , and a cubic foot of it weighs 19365 ounces.

But an important remark muft be made here. All bodies of homogeneous or unorganifed texture expand by heat. and contract by cooling. The expanfion and contraction by the fame change of temperature is very. different in different bodies. Thus water, when heated from \(60^{\circ}\) to \(100^{\circ}\), increafes its volume nearly rơ of its bulk, and mercury only \(\frac{\frac{x}{4}}{3}\), and many fubfances much lefs. Hence it follows, that an experiment determines the fecific gravity only in that very temperature in which the bodies are examined. It will therefore be proper always to note this temperature ; and it will be convenient to adopt fome very ufeful tempera: ture for fuch trials in general : perhaps about \(60^{\circ}\) of Fahrenheit's thermometer is as convenient as anyIt may always be procured in thefe climates without inconvenience. A temperature near to freezing would have fome advantages, becaufe water changes its bulk very little between the temperature \(32^{\circ}\) and \(45^{\circ}\). But this temperature cannot always be obtained. It will much conduce to the facility of the comparifon to. know the variation which heat produces on pure water. The following table, taken from the obfervations of Dr Blagden and Mr Gilpin (Phil, Tranf. 1792) will anfwer this purpofe.
\begin{tabular}{|c|c|c|}
\hline Tempera- &  & Specific Gravity. \\
\hline 30 & & \\
\hline 35 & 99910 & 1,20090 \\
\hline 40 & 99070 & 1,00094 \\
\hline 45 & 99914 & 1,00086 \\
\hline 50 & 99932 & 1,00068 \\
\hline 55 & 99962 & 1,00038 \\
\hline 60 & 100000 & 1,00000 \\
\hline 65 & 100050 & 0,99950 \\
\hline 70 & 100106 & 0,99894 \\
\hline 75 & 100171 & 0,99830 \\
\hline 80 & 10.0242 & 0,99759 \\
\hline 85 & 100320 & 0,99681 \\
\hline 90 & 100404 & 0,9959 \({ }^{8}\) \\

\hline 100 & 10-602 & 0,99702 \\
\hline
\end{tabular}

Thofe gentlemen obferved the expanfion of water to be very anomalous between \(32^{\circ}\) and \(45^{\circ}\). This is diftinctly feen during the gradual cooling of water to the point of freezing. It contracts for a while, and then fuddenly expands. - But we feldom have occafion to meafure fpecific gravities in fuch temperature.

The reader is now fufficiently acquainted with the principles of this hydroftatical method of determining the fpecific gravity of bodies, and can judge of the propriety of the forms which may be propofed for the experiment.

The fpecific gravity of a fluid may be determined either by filling with it a veffel with a narrow neck, or by weighing a folid body that is immerfed in it. It is hard to fay which is the beft way. The laft is not fubject to any error in flling, becaufe we may fufpend the folid by a fine wire, which will not difplace any fenfible quantity of the fluid; and if the folid is but a little heavier than the fluid, the balance being loaded only with the excefs, will be very fenfible to the fmalleft want of equilibrium: But this advantage is perhaps compenfated by an obfruction to the motion of the folid up or down in the fluid, arifing from vifcidity. When the weight in the oppofite fcale is yet too fmall, we flowly add more, and at laft grain by grain, which gradually brings the beam to the level. When it is exactly level, the weight in the fcale is fomewhat too great; for it not only balances the preponderance of the folid, but alfo this vifcidity of the fluid. But we may get rid of this error. Add a fmall quantity more ; this will bring the beam over to the other fide. Now put as much into the fcale on the fame fide with the folid; this will not reftore the beam to its level. We muft add more till this be accomplifhed; and this addition is the meafure of the vilcidity of the fluid, and muft be fubtracted from the weight that was in the other fcale when the beam came firf to a level. This effect of vifcidity is not infenfible, with nice apparatus, even in the pureft water, and in many fluids it is very confiderable-and, what is worfe, it is very changeable. It is greatly diminifhed by heat ; and this is an additional reafon for making thofe trials in pretty warm temperatures. But for fluids of which the vifcidity is confiderable, this method is. by no means proper; and we mut take the

\section*{[ 66: ] \\ S P E}
ather, and weigh them in a veffel with a narrow neck. Specific Mercury muft alfo be treated in this way, becaufe we Gravity. have no folid that will fink in it but gold and platina.

It is not fo eafy as one would imagine to fill a veffel precifely to the fame degree upon every trial. But if we do not operate on too fmall quantities, the unavoidable error may be made altogether infignificant, by having the neck of the veffel very fmall. If the veffel hold a pound of water, and the neck do not exceed a quarter of an inch (and it will not greatly retard the operation to have it half this fize), the examinator muft be very carelefs indeed to err one part in two thoufand; and this is perhaps as near as we can come with a balance. We mult always recollect that the capacity of the veffel changes by heat, and we muft know this variation, and take it into the account. But it is affectation to regard (as Mr Homberg would make us believe that he did) the difenfion of the veffel by the preffure of the fluid. His experiments of this kind have by no means the confiftency with each other that fhould convince us that he did not commit much greater errorsthan what arofe from-diftenfion.

In examining either folids or fluids, we muft be careful to free their furface, or that of the veffel in which the fuid is to be weighed, from air, which frequently adheres to it in a peculiar manner, and, by forming a. bubble, increafes the apparent bulk of the folid, or diminifhes the capacity of the veffel. The greateft part of what appears on thofe occafions feems to have exifted in the fluid in a fate of chemical union, and to be fet at liberty by the fuperior attraction of the fluid for the contiguous folid body. Thefe air bubbles muft be carefully brufhed off by hand. All greafy matters muft be cleared off for the fame reafon: they prevent. the fluid from coming into contact.

We mult be no lels careful that no water is imbibed. by the folid, which would increafe its weight without increafing its bulk. In fome cafes, however, a very long maceration and imbibition is neceffary. Thus, in' examining the fpecific gravity of the fibrous part of vegetables, we fhould err exceedingly if we imagined it as fmall as appears at firf. We believe that in moft: plants it is at leaft as great water, for after long ma* ceration they fink in it.

It is almoft needlefs to fay that the niceft and moft. fenfible balances are neceffary for this examination. Bam. lances are even conftructed on purpofe, and fitted withi feveral pieces of apparatus, which make the examina-1 tion eafy and neat. We have defcribed (fee Balanice) Mr Gravefande's as one of the moft convenient of any: His contrivance for obferving the fractions of a grain isextremely ingenious and expeditious, efpecially for detecting the effect of vifcidity.

The hydrometer, or aecometer, is another inftrument for afcertaining the fpecific gravity of fluids. This very pretty inftrument is the invention of a lady, as eminent for intellectual accomplifhments as: fhe was admired for her beauty. Hypatia, the learned daughter of the celebrated mathematician Theon of Alexandria, became for eminent for her mathematical knowledge, that the was made public profeffor of the fcience in the firf fchool in the world. She wrote a commentary on the work \(3^{3}\) of Apollonius and of Diophantus, and compofed Aftronomical Tables; all of which are loft. Thefe rareo
accome:
rpecific Gravity.
accomplifhments, lowever, could not fave her from the fury of the fanatics of Alexandria, who cut her in pieces for having taken an offenfive part in a difpute between the governor and patriarch.- We have defcribed fome of the moft approved of thefe inftruments in the article Hydrometer, and fhall in this place make a few obfervations on the principles of their conftruction, not as they are ufually made, accommodated to the examination of particular liquors, but as indicators of pure fpecific gravity. And we muft premife, that this would, for many reafons, be the beft way of conftructing them. The very ingenious contrivances for accommodating them to particular purpofes are unavoidably attended with many fources of error, both in their adjuftment by the maker and in their ufe ; and all that is gained by a very expenfive inftrument is the faving the trouble of infpecting a table. A fimple fcale of fpecific gravity would expofe to no error in conftruction, becaufe all the weights but one, or all the points of the fcale but one, are to be obtained by calculation, which is incomparably more exact than any manual operation, and the table can always be more exact than any complex obfervation. But a ftill greater advantage is, that the inftruments would by this means be fitted for examining all liquors whatever, whereas at prefent they are almoft ufelefs for any but the one for which they are conftrueted.

Hydrometers are of two kinds. The moft fimple and the moft delicate are juft a fubftitute for the hydroftatical balance. They confift of a ball (or rather an egg or pear.fhaped veffel, which moves more eafily through the fluid) A (fig. I.) having a foot projecting down from it, terminated by another ball \(B\), and a flender falk or wire above, carrying a little difh C. The whole is made fo light as to float in the lighteft fluid we are acquainted with; fuch as vitriolic or muriatic æther, whofe fpecific gravity is only 0,73 . This number fhould be marked on the difh, indicating that this is the fpecific gravity of the fluid in which the inftrument floats, finking to the point \(D\) of the ftem. The ball B is made heavy, and the foot is of fome length, that the inftrument may have flability, and fwim erect, even if confiderably loaded above; and, for the fame reafon, it muft be made very round, otherwife it will lean to a fide. When put into a heavier liquor, its buoyancy will caufe it to float with a part of the ball above the furface. Weights are now put into the fcale C, till the inftrument fink to D. The weight put into the fcale, added to the weight of the inftrument, is the weight of the difplaced fluid. This, compared with the weight of the whole when the infrument is fwimming in pure water, gives the fpecific gravity of the fluid. All trouble of calculation may be avoided by marking the weights with fuch numbers as thall indicate the fpecific gravity at once. Thus having loaded the inltrument to as to fink it to \(D\) in pure water, call the whole weight 1000 ; then weigh the inftrument itfelf, and fay, "as the weight when fwimming in water is to its prefent weight, fo is 1000 to a 4th proportional." This is the fpecific grawity of the liquor which would float the unloaded indtrument. Suppofe this to be 730 . The hydrometer would juft float in muriatic æther, and this fhould fee marked on the fide. Now make a fet of fmall
weights, and mark them, not by their weights in grains, but in fuch units that 270 of them fhall be equal to the weight which fits the inftrument for pure water.

Suppofe that, in order to float this infrument in a certain brandy, there are required 186 in thefe fmall weights. This added to 730 gives 916 for the fpecific gravity, and Shows it to be precifely excife proof fpirit. Nine weights, viz. \(256,128,64,32,16,8,4\), 2, 1 , will fuffice for all liquors from \(x\) ther to the ftrongeft worts. And that the trouble in changing the weights may be greatly leffened, let a few circles \(a, b, c, d, e\), be marked on the top of the ball. When we fee it float unloaded at the circle C for inftance, we know it will require at leaft \(\mathrm{r} 2 \delta\) to fink it to D thaton the ftem.

If the weights to be added above are confiderable, it raifes the centre of gravity fo much, that a fmall want of equilibrium, by laying the weights on one fide, will produce a great inclination of the inftrument, which is unfightly. Inftead therefore of making them loofe weights, it is proper to make them round plates, with a fmall hole in the middle, to go on a pin in the middle of the fcale. This will keep the inftrument always upright. But unlefs the hydrometer is of a confiderable fize, it can hardly be made fo as to extend from the lighteft to the lieavieft fluid which we may have occafion to examine, even though we except mercury. Some of the mineral acids are confiderably more than twice the weight of zther. When there is fuch a load at top, the hydrometer is very apt to overfet, and inclines with the fmalleft want of equilibrium. Great fize is inconvenient even to the philofopher, becaufe it is not always in his power to operate on a quantity of fluid fufficient to float the inftrument. 'Therefore two, or perhaps three, are neceffary for general examination. One may reach from æether to water ; another may ferve for all liquors of a fpecific gravity between 1 and \(I \frac{1}{2}\); and the third, for the mineral acids, may reach from this to 2 . If each of thefe be about two folid inches in capacity, we may eafily and expeditioully determine the fpecific gravity within one ten thoufandth part of the truth : and this is precifion enough for mof purpofes of fcience or bufinefs.
The chief queltions are, 1. To afcertain the fpecific gravity of an unknown fluid. This needs no farther explanation. 2. To afcertain the proportion of two fluids which are known to be in a mixture. This is done by difcovering the feciric gravity of the mixture by means of the hydrometer, and then deducing the proportion from a comparifon of this with the fpecific gravities of the ingredients.
In this mode of examination the bulk is always the fame ; for the hydrometer is immerged in the different fluids to the fame depth. Now if an inch, for example, of this bulk is made up of the heavieft fluid, there is an inch wanting of the lighteft; and the change made in the weight of the mixture is the difference between the weight of an inch of the heavieft and of an inch of the lighteft ingredients. The number of inches therefore of the heavieft flnid, is proportional to the addition made to the weight of the mixture. Therefore let B and \(b\) be the bulks of the heavieft and lighteft fluids in the bulk \(s\) of the mixture; and let \(D, d\), and \(\delta\) be the denfitics, or the weights, or the fpecific gravities (for they are in one:
ratio)

\section*{S P E [ 663 ] S P E}
cific ratio) of the heary fluid, the lighe fluid, and the mixture (their bulk being that of the hydrometer). We have \(\beta=\mathrm{B}+b\). The addition which would have been made to the bulk \(\beta\), if the lighteft fluid were changed entirely for the heavieft, would be \(\mathrm{D}-d\); and the change which is really made is i-d. Therefore \(\beta: b=\mathrm{D}-d: \delta-d\). For fimilar reafons we fhould have \(k: \mathrm{B}=\mathrm{D}-d: \mathrm{D}-\delta\); or, in words, "the difference between the fpecific gravities of ihe two fuids, is to the difference between the Jpecifc gravities of the mixture and of the lighteft fuid, as the bulk of the wwole to the buik of the beavieff contained in the mixture;" and "the difference of the Jpecific gravities of the two fluids, is to the difference of the fpactific gravities of the mixture and of the heavieff fuids, as the bulk of the rwhole to that of the lighteft contained in the mixture." This is the form in which the ordinary bufinefs of life requires the anfwer to be expreffed, becaufe we generally reckon the quantity of liquors by bulk, in gallons, pints, quarts. But it would have been equally eafy to have obtained the anfwer in pounds and ounces; or it may be had from their bulks, fince we know their fpecific gravities.

The hydrometer more commonly ufed is the ancient one of Hypatia, confifting of a ball, A (fig. 2.), made fleady by an addition \(B\), below it like the former, but having a long fem \(C F\) above. It is fo loaded that it finks to the top F of the ftem in the lighteft of all the fluids which we propofe to meafure with it, and to fink only to C in the heavieft. In a fluid of intermediate fpecific gravity it will fink to fome point between C and F .

In this form of the hydrometer the weight is always the fame, and the immediate information given by the infrument is that of different bulks with equal weight. Becaufe the inftrument finks till the bulk of the difplaced fluid equals it in weight, and the additions to the difplaced fluid are all made by the flem, it is evident that equal bulks of the ftem indicate equal additions of volume. Thus the ftem becomes a feale of bulks to the fame weight.

The only form in which the ftem can be made with fufficient accuracy is cylindrical or prifmatical. Such a ftem may be made in the mof accurate manner by wire-drawing, that is, paffing it through a hole made in a hardened fteel plate. If fuch a ftem be divided into equal parte, it becomes a fcale of bulks in arithmetical progreffion. 'This is the eafieft and moft natural divifion of the fcale; but it will not indicate denfities, \({ }^{\prime}\) pecific gravities, or weights of the fame bulk in arithmetical progreffion. The fpecific gravity is as the weight divided by the bulk. Now a feries of divifors (the bulks), in arithmetical progreffion, applied to the fame dividend (the bulk and weight of the hydrometer as it floats in water), will not give a feries of quotients (the fpecific gravities) in arithmetical progreffion: they will be in what is called harmonic progreffion, their differences continually diminifhing. This will appear even when phyfically confidered. When the hydrometer finks a tenth of an inch near the top of the ftem, it difplaces one tenth of an inch of a light fluid, compared with that difplaced by it when it is floating with all the ftem above the furface. In order therefore that the divifions of the ftem may indicate equal changes of fpecific gravity, they muft be in a feries of harmonic progreffionals increafing. The point at which the in.

Atrument floats in pure water fhould be marked rooos, and thofe above it \(999,998,997, \& \mathrm{cc}\); and thofe be low the water mark mult be numbered 1001, 1002, \(1003, \& \mathrm{c}\). Such a feale will be a very, appofite picture of the denfities of fluids, for the denfity or vicinity of the divifions will be precifely fimilar to the denfity of the fluids. Each interval is a bulk of fluid of the fame weight. If the whole inftrument were drawn out into wire of the fize of the ferm, the length from the water, mark would be 1000 .

Such are the rules by which the fcale muft be divided. But there mult be fome pointo of it determined by experiment, and it will be proper to take them as remote from each other as poffible. For this purpofe let the infrument be accurately, marked at the point where it ftands, in two fluids, differing as much in fpecific gravity as the inftrument will admit. Let it alfo be marked where it ftands in watér. Then determine with the utmoft precifion the fpecific gravities of thefe fluids, and put their values at the correfponding points. of the fcale. Then the intermediate points of the fcale muft be computed for the different intervening fpecific gravities, or it muft be divided from a pattern fcale of harmonic progreffionals in a way well known to the mathematical inftrument-makers. If the fpecific gravities have been accurately determined, the value 1005 will be found to fall precifely in the water mark. If we attempt the divifion entirely by experiment, by making a number of fluids of different fpecific gravities, and marking the ftem as it flands in them, we fhall find the divifions turn out very anomalous. This is however the way ufually practifed; and there are few hydrometers, even from the beft maker, that hold true to a fingle divifion or two. Yet the method by computation is not more troublefome; and one feale of harmonic progreffionals will ferve to divide every ftem that offers. We may make ufe of a fcale of equal parts for the ftem, with the affilance of two little, tables. One of thefe contains the fpecific gravities in harmonic progreffion, correfponding to the arithmetical fcale of bulks on the fem of the hydrometer; the other contains the divifions and fractions of a divifion of the fcale of bulks, which correfpond to an arithmetical fcale of fpecific gravities. We believe this to be the beft method of all. The fcale of equal parts on the flem is fo eafily made, and the little table is fo eafily infpected. that it has every advantage of accuracy and difpatch, and it gives, by the way, an amufing view of the relation of the bulks and denfities.

We have hitherto fuppofed a fcale extending from the lighteft to the heavieft fluid. But unlefs it be of a very isconvenient length, the divifions muft be very minute. Moreover, when the bulk of the ftem bears a great proportion to that of the body, the inftrument does not fwim feady; it is therefore proper to limit the range of the inftrument in the fame manner as thofe of the firlt kind. A range from the denfity of \(x\) ther to that of water may be very well executed in an inftrument of very moderate fize, and two others will do for all the heavier liquors; or an equal range in any other denfities as may fuit the ufual occupations of the experimenter.

To. avoid the inconveniences of a hydrometer with a very long and flender fem, or the neceffity of having a feries of them, a third fort has been contrived, in whicks

\section*{S P E [ 664 ] S P E}

Srecific Gravity.
which the principle of both are combined. Suppofe a hydrometer with a ftem, whofe bulk is \(\frac{x^{2}}{10}\) th of that of the ball, and that it finks in æther to the top of the ftem; it is evident that in a fluid which is \(\frac{x}{r o}\) th heavier, the whole ftem will emerge; for the bulk of the difplaced fluid is now \(\frac{1}{\text { ro }}\) th of the whole lefs, and the weight is the fame as before, and therefore the fpecific gravity is \(T^{3}\) th greater.

Thus we have obtained a hydrometer which will indicate, by means of divifions marked on the ftem, all fpecific gravities from 0,73 to 0,803 ; for 0,803 is fioth greater than 0,73 . Thefe divifions mult be made in harmonic progreffion, as before directed for an entile fcale, placing 0,73 at the top of the fem and 0,803 at the bottom.

When it floats at the loweft divifion, a weight may be put on the top of the Aem, which will again fink it to the top. This weight muft evidently be 0,073 , or \(\frac{3}{\text { ion }}\) th of the weight of the fluid difplaced by the unloaded inftrument. The hydrometer, thus loaded, indicates the fame fpecific gravity, by the top of the fem, that the unleaded inftrument indicates by the loweft divifion. Therefore, "when loaded, it will indicate another feries of fpecific gravities, from 0,803 to \(0,88_{33}\) \((=0,803+0,0803)\), and will float in a liquor of the fpecific gravity 0,8833 with the whole ftem above the furface.

In like manner, if we take off this weight, and put on \(1=0,080,3\), it will fink the hydrometer to the top of the ftem ; and with this new weight it will indicate another feries of feecific gravities from 0,8833 to \(0,97163(=0,8833+0,08833)\). And, in the fame manner, a third weight \(=08833\) will again fink it to the top of the ftem, and fit it for another feries of fpecific gravities up to 1,068793 . And thus, with three weights, we have procured a hydrometer fitted for all liquors from æether to a wort for a malt liquor of two barrels per quarter. A nother weight, in the fame progreffion, will extend the inftrument to the ftrongeft wort that is brewed.
This is a very commodious form of the inftrument, and is now in very general ufe for examining fpirituous liquors, worts, ales, brines, and many fuch articles of commerce. But the divifions of the fcale are generalIy adapted to the queftions which naturally occur in the bufinefs. Thus, in the commerce of ftrong liquors, it is ufual to eftimate the article by the quantity of fpirit of a certain ftrength which the liquor contains.This we have been accuftomed to call proof fpirit, and it is fuch that a wine gallon weighs 7 pounds 12 ounces; and it is by this ftrength that th excife duties are levied. Therefore the divifions on the fcale, and the weights which connect the fucceffive repetitions of the fcale, are made to exprefs at once the number of gallons or parts of a gallon of proof firits contained in a gallon of the liquor. Such inftruments fave all trouble of calculation to the excifeman or dealer; but they limit the ufe of a very delicate and expenfive inftiument to a very narrow employment. It would be much better to adhere to the expreffion either of fpecific gravity or of bulk; and then a very fmall table, which could be comprifed in the fmallelt cafe for the inftrument, might rendeer ti applicable to every kind of fluid.

The reader cannot but have obferved that the fucceffive weights, by which the fhort fcale of the inftru-
ment is extended to a great range of fpecific gravities, do not increafe by equal quantities. Each difference is the weight of the-liquor diplaced by the graduatec ftem of the inftrument when it is funk to the top of the fcale. It is a determined aliquot part of the whole weight of the inftrument fo loaded, (in our example it is always \(\frac{\pi}{T}\) th of it). It increafes therefore in the fame proportion with the preceding weight of the loaded inftrument. In fhort, both the fucceffive additions, and the whole weights of the loaded inftrument, are quantities in geonetrical progreffion; and, in like manner, the divifions on the fcale, if they correfpond to equal differences of fpecific gravity, muft alfo be unequal. This is not fufficiently attended to by themakers; and they commit an error here, which is very confiderable when the whole range of the inftrument is great. For the value of one divifion of the fcale, when the largeit weight is on, is as much greater than its value, when the infrument is not loaded at all, as the full loaded inftrument is heavier than the inftrument unload. ed. No manner whatever of dividing the fcale will correfpond to equal differences of focific gravity through the whole range with different weights; but if the divifions are made to indicate equal proportions of gravity when the inftrument is ufed without a weirht, they will indicate equal proportions throughout. 'This is evident from what we have been juit now faying ; for the proportion of the fpecific gravities correfponding to any two immediately fucceeding weights is always the fame.

The beft way, therefore, of conftructing the inftrument, fo that the fame divifions of the fcale may beaccurate in all its fucceffive repetitions with the different weights, is to make thefe divifions in geometrical progreffion. T'he correfponding fpecific gravities will al fo be in geometric proportion. Thefe being all inferted in a table, we obtain them with no more trouble than by infpecting the fcale which ufually accompanies the hydrometer. This table is of the moft eafy confruction; for the ratio of the fucceffive bulks and fpecific gravities being all equal, the differences of the logarithms are equal.

This will be illuftrated by applying it to the example already given of a hydrometer extending from 0,73 to 1,068793 with three weights. This gives four repetitions of the fcale on the ftem. Suppofe this fcale divided into 10 parts, we lave 40 fpecific gravities. Let thefe be indicated by the numbers \(0,1,2,3, \& \mathrm{c}\). to 4.. The mark o is affixed to the top of the ftem, and the divifions downwards are marked \(1,2,3,8 \mathrm{c}\). the loweft being io. Thefe divifions are eafily determined. The ftem, which we may fuppofe 5 inclies long, was fuppofed to be \(\frac{x^{2}}{1}\) th of the capacity of the ball. It may therefore be confidered as the extremity of a rod of II times its length, or 55 inches; and we mult find nine mean proportionals between 50 and 55 inches. Subtract each of thefe from 55 inches, and the remainders are the diftances of the points of divition from 0 , the top of the fcale. The finalleft weight is marked 10 , the next 20 , and the third 30 . If the inftrument loaded with the weight 20 finks in fome liquor to the mark 7 , it indicates the fpecific gravity 27 , that is, the 27 th of 40 mean proportionals between 0,73 and 1,068793 , or \(0,944^{2} 4^{2}\). 'J'o obtain all thefe intermediate fpecific gravities, we have only to fubtract 9.8633229 , the lo-

\section*{S P E \\ [ 663 ] \\ \(\$ \mathrm{P}\)}
garithm of 0,73 , from that of \(1.068 \% 93\), viz. \(0,02889,37\), and take 0.0041393 , the 40 th part of the difference. Multiply this by \(\mathrm{T}, 2,3\), \& c , and and the logarithm of 0,73 to each of the products. The fums are the logarithms of the fpecific gravities required: Thefe will be found to proceed fo equably, that they may be interpolated ten times by a fimple table of proportional parts without the fmalleft fentible error. Therefore the ftem may be divided into a hundred parts very fenfible to the eye (each being nearly the 20 th of an inch), and 400 degrees of fpecific gravity obtained within the range, which is as near as we can examine this matter by any hydrometer. Thus the fpecific gravities correSponding to \(\mathrm{n}^{\circ} 26,27,28,29\), are as follow :
\begin{tabular}{llcc}
26 & 0,93529 & 1f Diff. & 2 d Diff. \\
27 & \(0,944^{2}+\) & 895 & 9 \\
28 & 0,95328 & 904 & 9 \\
29 & 0,96241 & 913 &
\end{tabular}

Nay, the trouble of infpecting a table may be avoided, by forming on a fcale the logarithms of the numbers between 7300 and 1068,793, and placing along fide of it a fcale of the fame length divided into 400 equal parts, numbered from 0 to 400 . Then, looking for the mark fhown by the hydrometer on this fcale of equal parts, we fee oppofite to it the fpecific gravity.

We have been thus particular in the illuftration of this mode of conftruction, becaufe it is really a beautiful and commodious inftrument, which may be of great ufe both to the naturalift and to the man of bufinefs. A table may be comprifed in 20 octavo pages, which will contain the fpecific gravities of every fluid which can intereft either, and anfwer every queftion relative to their admixture with as much precifion as the obfervations can be made. We therefore recommend it to our readers, and we recommend the very example which we have given as one of the moft convenient. The initrument need not exceed eight inches in length, and may be contained in a pocket cafe of 2 inches broad and as many deep, which will allo contain the fcale, a thermometer, and even the table for applying it to all fuids which have been examined.

It is unfortunate that no graduated liydrometer can be made fo eafily for the examination of the corrofive mineral acids (A). Thefe mult be made of glafs, and we cannot depend on the accurate cyliadric form of any glafs ftem. But if any fuch can be procured, the conftruction is the fame. The divided fcale may either be on thin paper palted on the infide of the ftem, or it may be printed on the ftem itfelf from a plate, with ink made of a metallic calx, which will attach itfelf to the glafs with a very moderate heat. We would recommend common white enamel, or arienical glafs, as the fitteft material for the whole inffrument; and the ink ufed, in taking the impreffion of the fcale, may bc the fame that is ufed for the low-priced printing on Delft ware pottery- Firlt form the fcale on the ftem. Then, having measured the folid contents of the graduated part as exactly as poffible, and determined on the general fhape of the ball and counterpoife below, calculate its fize, 'fo that it may be a little lefs than ten times that of the Vol. XVII. Part II.
ttem. The glafs blower can copy this very nearly, and join it to the tenn. 'Then make two brines or otherli. quors, which fhall have fpecific gravities in the ratio of

Specific Giravaty. Io to 1 I . Load the inftrument fo that it may fink to o in the lighteft. When put into the heavieft, it fhould rife to 10. If it does not rife fo high, the immerfed part is too fmall. Let the glafs blower enlarge the ball of the counterpoife a little. Repeat this trial till it be exact. Nothing now remains but to form the weights : And here we obferve, that when the inftrument is to have a very great range, as for examining all ftates of the vitriolic acid, it has a chauce of being very tottering when loaded with the greateft weight on the top of fo long a fcale. To avoid this, Mr Quin and others have added fome of their weights below.But this will not fuit the prefent conftruction, becaufe it will alter the proportion between the bulks of the ftem and immerfed part. Therefore let thefe weights confift of cylinders of metal fmall enough to go into the ftem, and let them be foldered to the end of long wires, which will let them go to the bottom, and leave a fmall hook or ring at top. Thefe can lie alongfide of the inftrument in its cafe. , This is indeed the beft confluction tor every hydrometer, becaufe it inakes it incemparably more fteady. The inttrument is poifed by fmall fhot or mercury. But it will be mnch betterto do it with Newton's fufible metal (three parts of tin, five parts of lead, and eight parts of biimuth) in coarfe flings. When the exact quantity has been put in, the inftrument may be fet in a veffel of oil, and this kept on the fire till all is completely melted. It foon freezes again, and remains faft. If this metal is not to be had \({ }_{2}\) let a few bits of fealing-wax be added to the mercuny or hot, to make up the counterpoife. When heated, it will float a-top, and when it freezes again it will keep all faft. Thus we hall make a very complete and cheap inftrument.

I'here is yet another method of examining the fpecific gravities of fluids, firft propofed by Dr Wilfon, late profeffor of aftronomy in the univerfity of Glafgow. 'This is by a feries of fmall glafs bubbles, differing equally, or according to fome rule, from each other in fpecific gravity, and each marked with its proper number. When thefe are thrown into a fluid which is to be examined, all thofe which are heavier than the fluid will fall to the bottom. Then holding the veffel in the hand, or near a fire or candle, the fluid expands, and one of the floating bubbles begins to fink. Its fpecific gravity, therefore, was either equal to, or a little lefs than, that of the fluid; and the degree of the thermometer, when it began to fink, will inform us how much it was deficient, if we know the law of expanfion of the liquor. . Sets of thefe bubbles fitted for the examination of fpirituous liquors, with a little treatife thowing the manner of ufing them, and calculating by the thermometer, are made by Mr Brown, an ingenious artilt of Glafgow, and are often uied by the dealers in fpirits, being found both accurate and expeditious.

Alfo, though a bubble or two fhould be broken, the Atrength of ipirits may eafily be had by means of the remainder, unlefs two or three in immediate fucceffion \(4 . \mathrm{P}\)
(A) It would be worth while to try copper enamelled.

\section*{S PE}

Srecific Gravity.
be wanting: for a liquor which anfwers to \(\mathrm{N}^{\circ} .4\) will fink \(\mathrm{N}^{\circ}{ }_{2}\) by heating it a few degrees, and therefore \(\mathrm{N}^{\nu} 2\) may be fpared. This is a great advantage in ordinary buinefs. A nice hydrometer is not only an expenfive inftrument, but exceedingly delicate, being fo very thin. If broken or even bruifed, it is ufelefs, and can hardly be repaired except by the very maker.

As the only queftion here is, to determine how many gallons of excife proof firits is contained in a quantity of liquor, the artift has conftructed this feries of bubbles in the fimpleft manner poffible, by previoufly making 40 or 50 mixtures of fpirits and water, and then adjufting the bubbles to thefe mixtures. In fome fets the number on each bubble is the number of gallons of proof firits contained in 100 gallons of the liquor. In other fets the number on each bubble expreffes the gallons of water which will make a liquor of this ftrenvth, if added to 14 gallons of alcohol. Thus, if a liquor anfwers to \(N^{\prime}\), then 4 gallons of water added to 14 gallons of alcohol will make a liquor of this ftrength. The firf is the beft method; for we fhould be miftaken in fuppofing that 18 gallons, which anfwer to \(\mathrm{N}^{\circ} 4\), contains exactly i4 gallons of alcohol: it contains more than 14. for a reafon to be given by and by:

By examining the fpecific gravity of bodies, the philofopher has made fome very curious difcoveries. The molt remarkable of thefe is the chanre which the denfity of bodies fuffers by mixture. It is a molt reafonable expectation, that when a cubic foot of one fubftance is mised any bow with a cubic foot of another, the bulk of the mixture will be two cubic feet; and that 18 gal. Ions of water joined to 18 gallons of oil will fill a veffel of 36 gallons. A coordingly this was never doubted; and even Archimedes, the moft fcrupulous of mathematicians, proceeded on this fuppofition in the folution of his famons problem, the difcovery of the proportion of filver and gold in a mixture of both. He does not even mention it as a poftulate that may be granted him, fo much did he conceive it to be an axiom Yet a little reflection feems fufficient to make it doubtful. and to sequire examination. A box filled with mufket-balls will receive a confiderable quantity of fmall thot, and after this a confiderable quantity of fine fand, and after this a confiderable quantioy of water. Something like this might happen in the admixture of bodies of porous sexture. But fuch fubftances as metals, glafs, and fluids, where no difeuntinuity of parts can be perceived, or was sufpected, feem free from every chance of this kind of introlufception. Lord Bacon, however, without being a naturalift or mathematician ex profeffo, in \({ }^{f}\) erred from the mobility of fluids that they confifted of difcrete particles, which mult have pores interpofed, whatever be their figure And if we afcribe the different denfities, or other fenfible qualities, to difference in fize or figure of thofe particles, it mult frequently happen that the fmaller particles will be lodged in the interfices between the larger, and thus contribute to the weight of the fenfible mals without increafing its bulk. He therefore fufpects that mixtures will be in general lefs bulky than the fum of their ingredients.

Accordingly, the examination of this queftion was one of the firft employments of the Royal Society of London, and long before its inftitution had occupied the attention of the gentlemen who afterwards compofed it. The regifter of the Society's early meetings
contains many experiments on this fubject, with mix. tures of gold and filver, of other metals, and of various fluids, examined by the hydroftatical balance of Mr Boyle. Dr Hooke made a prodigions number, chiefly on articles of commerce, which were unfortunately loft in the fire of Londen.

It was foon found, however, that Lord Bacon's core jecture had been well founded, and that bodies changed their derfity very fenfibly in many cafes. In general, it was found that bodies which had a ftrong chemical affinity increafed in denfity, and that their admixture was accompanied with heat.

By this difcovery it is manifeft that Archimedes had not folved the problem of detecting the quantity of filver mixed with the gold in King Hiero's crown, and that the phyfical folution of it requires experiments made on all the kinds of matter that are mixed together. We do not find that this has been done to this day, al. though we may affirm that there are few queftions of more importance. It is a very curious fact in chemiftry, and it would be moft defirable to be able to reduce it to fome general laws : For inftance, to afcertain what is the proportion of two ingredients which produces the greateft change of denfity. This is important in the fcience of phyfics, becaufe it gives us confiderable information as to the mode of action of thofe natural powers or forces by which the particles of tano gible matter are united. If this introfufception, concentration, compenetration, or by whatever name it be called, were a mere reception of the particles of one fubftance into the interftices of thofe of another, it is evident that the greatelt concentration would be obferved when a fmall quantity of the recipiend is mix. ed with, or diffeminated through, a great quantity of the other. It is thus that a fmall quantity of fine fand will be received into the interftices of a quantity of fmall fhot, and will increafe the weight of the bagful without increafing its bulk. 'The cafe is nowife different when a piece of freeftone has grown heavier by imbibing or abforbing a quantity of water. It more than a certain quantity of fand has been added to the fmall hot, it is no longer concealed. In like manner, various quantities of water may combine with a mafs of clay, and increafe its fize and weight alike. All this is very conceivable, occalioning no difficulty.

But this is not the cafe in any of the mistures we are now confidering. In all thefe, the firft additions of either of the two fubftances produce but an inconfiderable change of general denfity ; and it is in general moft remarkable, whether it be condenfation or rares. faction, when the two ingredients are nearly of equa bulks. We can illuftrate even this difference, by rel flecting on the imbibition of water by vegetable folids, fuch as timber. Some kinds of wood have their weight much more increafed than their bulks; other kinds of wood are more enlarged ir bulk than in weight. The like happens in grains. This is curious, and fhows in the molt unqueftionable manner that the particles of bodies are not in contact, but are kept together by furces which aet at a diftance. For this diftance between the centres of the particles is mof evidently fufceptible of variation; and this variation is occafioned by the in troduction of another fubftance, which, by acting on the particles by attraction or repulfion, diminifhes or increafes thieir suutual actions, and makes new diftances.
mecef

\section*{\(S P E\)}
aife neceflary for bringing all things again into equulibrium. We refer the curious 'eader to the ingenious theory of
the Abbé Bofoovich for an excellent this fubjee Boicovich for an excellent illuttration of This quetion is no lefs important to the man of bufinefs. Thill we know the condenfation of thofe metals by mixture, we cannot tell the quantity of alloy in gold and filver by means of their fpecific gravity; nor can we tell the quantity of pure alcohol in any fpirituous liquor, or that of the valuable falt in any folution of it. For want of this knowledge, the dealers in gold and filver are obliged to have recourfe to the tedious and difficult teft of the affay, which cannot be made in all places or by all men. It is therefore much to be wifhed, that fome perfons would inftitute a feries of experiments in the molf interefting cafes: for it muft be obferved, that this change of denfity is not always a fnall matter; it is fometimes yery confiderable and paradoxical. A remarkable inflance may be given of it in the mixture of brais and tin for bells, great guns, optical 1peculums, \&c. The fpecific gravity of caft brafs is nearly 8,006 , and that of tin is nearly 7,363 . If two parts of brafs be mixed with one of tin, the fpecific grawity is 8,917 ; whereas, if each had retained its former bulk, the fpecific gravity would have been only 7,793 \(\left(=\frac{2 \times 8, \circ=6+7,363}{3}\right)\). A mixture of equal parts Thould have the fpecific gravity 7,684 ; but it is \(8,44^{1}\). A mixture of two parts tin with one part brafs, inftead of being 7,577, is 8,027 .

In all thefe cafes there is a great increafe of fpecific gravity, and confequently a great condenfation of parts or contraction of bulk. The firt mixture of eight cubic inches of brafs, for inftance, with four cubic inches of tin, does not produce 12 cubic inches of bell-metal, but only \(10 \frac{1}{2}\) nearly, having flarunk \(\frac{1}{5}\). It would appear that the diftances of the brafs particles are moft affected, or perhaps it is the brafs that receives the tin into its pores; for we find that the condenfations in thefe mixtures are nearly proportional to the quantities of the brals in the mixtures. It is remarkable that this mixture with the lighteft of all metals has made a compofition more heavy and denfe than brafs can be made by any hammering.

The moft remarkable inflance occurs in mixing iron with platina. If to cubic inches of iron are mixed with \(1 \frac{1}{4}\) of platina, the belk of the compound is only \(9 \frac{3}{4}\) inches. The iron therefore has not fimply received the platina into its pores: its own particles are brought nearer together. There are fimilar refults in the folution of turbith mineral, and of fome other falts, in water. The water, initead of rifing in the neck of the veffel, when a fmall quantity of the falt has been added to it, furks confiderably, and the two ingredients occupy lefs room than the water did alone.
The fame thing happens in the mixture of water with other fluids and different fluids with each other: But we are not able to trace any general rule that is obferved with abfolute precifion. In moot cafes of fluids the greatelt condenlation happens when the bulks of the ingredients are nearly equal. Thus, in the mixture of alcohol and water, we have the greateft condenfation when \(16 \frac{1}{2}\) ounces of alcohol are mixed with 20 ounces of water, and the condenfation is about \(\frac{1}{10}\) of the whole bulk of the ingredients. It is extremely va-
can be made in this relipest.
A differtation has beer publifhed on this fubject by Dr Hahn of Vienna, intitled De Effracia Mixtionis in mutandis Corporum Voluminitus, in which all the remarkable inftances of the variation of denfity have been collected. All that we can do (as we have no directing principle) is to record fuch inflances as are of chief importance, being articles of commerce.
The firf that occurs to us is the mixtures of alcohol and water in the compofition of fpirituous liquors. This has been confidered by many with great care. The moft fcrupulous examination of this, or perhaps of any mixture, has been lately made by Dr Blayden (now Sir Charles Blagden) of the Royal Society, on the requi. fition of the Board of Excife. He has publifhed an account of the examination in the Philofophical Tranfactions of London in 1791 and 1792 . We fhall give an account of it under the article SPIRIquous Liquors; and at prefentonnly felect one column, in order to fhow the condenfation. The alcohol was almott the ftronseft that can be produced, and its fpecific gravity, whes of the temperature \(60^{\circ}\), was 0,825 . The whole mixLures were of the fame temperature.

Column I. contains the pounds, ounces, or other meafures by weight, of alcohol in the mixture. Column 2. contains the pounds or ounces of water. Column 3 . is the fum of the bulks of the ingredients, the bulk of a pound or ounce of water being accounted 1 . Column 4. is the obferved fpecific gravity of the mixture, taken from Dr Blagden's differtation. 'Column 5. is the fpecific gravity which would have been obferved if the ingredients had each retained its own fpecific gravity. This we calculated by dividing the fum of the two numbers of the firft and fecond columns by the cor refponding number of the third. Column 6 . is the difference of colunn 4. and column 5 . and exhibits the condenfation.

\end{tabular}

It is to be remarked, that the condenfation is great eft when \(16 \frac{1}{2}\) ounces of alcohol have been added to 20 of water, and the condenfation is \(\frac{2633}{5 \frac{3}{8} \frac{3}{8} 35}\), or nearly \(\frac{1}{3}\) th of the computed denfity. Since the fpecific gravity of alcohol is 0,825 , it is evident that \(16 \frac{1}{2}\) ounces of alcohol and 20 ounces of water have equal bulks. So that the condenfation is greatef wher the fubitances are mix ed in equal volumes; and 18 gallons of alcohol mixed with 18 gallons of water will produce not 36 gallons of fpirits, but 35 only.

We may alfo obferve, that this is the mixture to which our revenue-laws refer, declaring it to be one to \(\int_{3} x\) or one in feven under proof, and to weigh 7 pounds 13 ounce per gallon. This proportion was probably felected as the moft eafily compoled, viz. by mixing cqual meafures of water and of the ftrongeft fpirit which the known proceffes of diftillation could produce. Its fpecific gravity is 0,939 very nearly.

We mult confider this elaborate examination of the mixture of water and alcoliol as a ftandard feries of experiments, to which appeal may always be made, whether for the purpofes of fcience or of trade. The regularity of the progreffion is fo great, that in the column which we have examined, viz. that for temperature \(60^{\circ}\), the greateft anomaly does not amonnt to one part in fix thoufand. The form of the ferics is alfo very judicioully chofen for the purpofes of fcience. It would perlaps have been more directly fereometrical had the proportions of the ingredients been ftated in bulks, which are more immediately connected with denfity. But the author has affigned a very cogent reafon for his choice, viz. that the proportion of bulks varies by a change of temperature, becaufe the water and fpirits follow different laws in their expanfion by heat.

This is a proper opportunity for taking notice of a miftake which is very generally made in the conclufions drawn from experiments of this kind. Equal additions of the fpiit or water produce a feries of fpecific gravities, which decreafe or increafe by differences continually diminifhing. Hence it is inferred that there is a contraction of bulk. Even Dr Lewis, one of our

\section*{S P E}
moft accomplifhed naturalifts, advances this pofition, in a differtation on the pot-a?h of America ; and it confiderably affects his method for eftimating the ftrength of the pot-af leys. But that it is a miltake, appears plainly from this, that although we add for ever equal quantities of the firits, we fhall never produce a mixture which has as fmall a fecific gravity as alcohol. Therefore the feries of fucceffive gravities muft approximate to this without end, like the ordinates of a hyperbolic curve referred to its affymptote.

That this may appear in the moft gereral terms, let \(w\) reprefent the weight of the conftant quantity of water in the mixture, and let \(a\) be the weight of the fmall addition of firits. Alfo let \(w\) reprefent the bulk of this quantity of water, and \(b\) the bulk of the fmall addition of alcohol. The weight of the mixture is \(w+a\), and its bulk is \(w+b\), and its fpecific gravity is \(\frac{w+a}{w+b}\). If we now add a fecond equal quantity of fpirits, the weight will be \(w+2 a\), and if the fpirit retains its den. fity unchanged, the bulk will be \(w+2 b\), and the fpecific gravity is \(\frac{w+2 a}{w+2 b}\) : and after any number \(m\) of fuch equal additions of fpirits, the fpecific gravity will be \(\frac{w+m a}{w+m b}\). Divide the numerator of this fraction by its denominator, and the quotient or fpecific gravity will be \(\mathrm{I}+\frac{m \times \overline{a-b}}{w+m b}\). This confifts of the conftant part r , and the variable part \(\frac{m(a-b)}{w+m b}\). We need attend only to this part. If its denominator were conflant, it is plain that the fucceffive fpecific gravities would have equal differences, each being \(=\frac{a-b}{2 v+m b}\), becaufe \(m\) in. creafes by the continual addition of an unit, and \(a-b\) is a conftant quantity. But the denominator \(w+m b\) continually increafes, and therefore the value of the fraction \(\frac{a-b}{z+m b}\) continually diminifhes.

Therefore the gradual diminution of the increments or decrements of fecific gravity, by equal additions of one ingredient to a contant meafure of the other, is not of itfelt an indication of a change of denfity of either of the ingredients; nor proves that in very diluted mix. tures a greater proportion of one ingredient is abforbed or lodged in the interftices of the other, as is generally imagined. 'This muft be afcertained by comparing each fpecific gravity with the gravity expreffed by I + \(\frac{w+m(a-b)}{w+m b}\)

This feries of fpecific gravities refembles fuch a num merical feries as the following, I ; ........;1,156; 1,\(163 ; 1,+69 ; \& c\). the terms of which alfo confilt of the conftant integer 1 , and the decimal fractions 0,156 ; 0,\(163 ; 0,169 ; \& c\). The fraction \(\frac{m(a-b)}{w+m b}\) expreffes this decimal part. Call this \(d\), or make \(d=\frac{m(a-b}{w+m b}\). This will give us \(b=\frac{m a-w d}{m(1+d)}\). Now \(a\) is the weiglit of the added ingredient, and \(d\) is the variable part of the fpecific gravity obferved; and thus we learn whe-

\section*{S P E}
[ 669 ]
recific ther \(b\), the bulk of the added ingredient, fuffers any change. We fhall have occafion by and by to refume the confideration of this queftion, which is of the firft moment in the theory of fpecific gravities, and has great influence in many tranfactions of commerce.
'This feries of fpecific gravities is not fo well fitted for commercial tranfactions. In thefe the ufual queftion is, how many gallons of alcohol is there in a caff, or fome number of gallons of fpirit? and it is more directly anfwered by means of a table, formed by mixing the ingredients in aliquant parts of one conftant bulk. The following table, conftructed from the experiments of Mr Brifon of the academy of Paris, and publihed in the Memoirs for 1769 , is therefore inferted.
\begin{tabular}{|c|c||c|c|c|c|}

\hline
\end{tabular}

In this table the whole quantity of firituous liquor is always the fame. The firft column is the number of meafures. (gallons, pints, inches, \&c.) of water in the mixture; and column 2 d gives the meafures of alcohol. Column 3d is the fpecific gravity which was obferved by Mr Briffon. Column \(4^{\text {th }}\) is the fpecific gravity which would have been obferved if the fpirits, or water, or both, had retained their fpecific deufity unchanged. And the 5 th column marks the augmentation of fpecific gravity or denfity in parts of 10,000 . A 6th column is added, frowing the bulk of the 16 cubic meafures of the two ingredients. Each meafure may be conceived as the 16 th part of \(\mathrm{re}, 000\), or 62 s ; and we may fuppofe them cubic inches, pints, gallons, or any folid meafure.

This table fcarcely differs from Sir Charles Blagden's; and the very fmall difference that may be obferved, arifes from Mr Briflon's having ufed an alcohol not fo completely rectified. Its. fpecific gravity is 0,837 1, whereas the other was only 0,825 .

Here it appears more diftinetly that the condenfation is greatelt when the two ingredients are of equal bulk.

Perhaps this feries of fpecific gravities is as declara tive as the other, whether or not there is a change of đenfity induced on either of the ingredients. The: whole bulk being always the fame, it is plain that the
fucceffive equal additions to one of the ingredients is a fucceffive equal abftraction of the other. The change produced, therefore, in the weight of the whole, is the difference between the weight of the ingredient which is taken out and the weight of the equal meafure of the other which fupplies its place. Therefore, if neither ingredient changes its denfity by mixture, the weights of the mixtures will be in arithmetical progref. fion. If they are not, there is a variation of denfity in one or both the ingredients.

We fee this very clearly in the mixtures of water and alcohol. The firft fpecific gravity differs. from the fecond by 156, and the laft differs from the preceding by no more than 8r. Had neither of the denfities changed, the common difference would have been 102 . We obferve alfo, that the augmentation of fpecific gravity, by the fucceffive addition of a meafure of water, grows lefs and lefs till 12 meafures of water is mixed: with 4 of alcohol, when the augmentation is only 58 , and then it increafes again to \(8 \mathbf{I}\).

It alfo appears, that the addition of one meafure of water to a quantity of alcohol produces a greater change of denfity than the mixture of one meafure of alcohol to a quantity of water. Hence fome conclude, that the water difappears by being lodged in the interftices of the fpirit. But it is more agreeable to the jufteft notions which we can form of the internal confitution of tangible bodies to fuppofe that the particles of water diminifh the diftances between the particles of alcohol by their ftrong attractions, and that this diminution (exceedingly minute in itfelf) becomes fenfible on account of the great number of particles whofe diftances are thus diminifhed. This is merely a probability founded on this, that it would require a much greater diminution of diftances if it was the particles of water which had their diftances thus diminifhed. But the greater probability is, that the condenfation takes place in both.

We have been fo particular in our confideration of this inixture, becaufe the law of variation of denfity has, in this inftance, been afcertained with fuch precilion by the elaborate examination of Sir Charles Blagden, fo that it may ferve as an example of what happens in almoft every mixture of bodies It merits a ftill farther difcuflion, becaufe it is intimately connected with the action of the corpufcular forces; and an exact knowledge. of the variations of diftance between the particles will go far to afcertain the law of action of thefe forces. But the limits of a Work like this will not permit us to dwell longer on this fubject. We proceed therefore to give another ufefil table.

The vitriolic or fulphuric acid is of extenfive ufe in manufactures under the name of oil of vitriol. Its value depends entirely on the faline ingredient, and the: water is merely a vehicle for the acid. This, being much denfer than water, affects its fpecific gravity, and thus gives us a method of afcertaining its ftrength.

The ftrongeft oil of vitriol that can be eafily manu. factured contains \(612 \frac{3}{\frac{3}{0}}\) grains of dity acid; united with \(3^{8} 7 \frac{1}{20}\) grains of water, which cannot be feparated from it by diftillation, making 1000 grains of O1L O vitriol. Its fpecific gravity in this ftate is \(1,877\).

The following table fhows its fpecific gravity at the tentperature \(55^{\circ}\), when diluted by the fucceffive addition of parts of water by weight.

\end{tabular}

Here is obferved a much greater condenfation than in the mixture of alcohol and water. But we cannot affign the proportion of ingredients which produces the greateft condenfation ; becaufe we cannot, in any cafe, fay what is the proportion of the faline and watery ingredients. The ftrongeft oil of vitriol is already a watery folution; and it is by a confiderable and uncertain detour tiat Mr Kirwan has affigned the proportion of 612 and 388 nearly. If this be the true ratio, it is unlike every other folution that we are acquainted with; for in all folutions of falts, the falt occupies lefs room in its liquid form than it did when folid; and here it would be greatly the reverfe.

This folution is remarkable alfo for the copious emergence of heat in its dilutions with more water. This has been afcribed to the great fuperiority of water in its capacity for heat; but there are facts which render this very doubtful. A veffel of water, and another of oil of vitriol, being brought from a cold room into a warm one, they both imbibe heat, and rife in their temperature; and the water employs nearly the fame time to attain the temperature of the room.

Aquafortis or nitrous acid is another fluid very much employed in commerce ; fo that it is of importance to afcertain the relation between its faline ftrength and its fpecific gravity. We owe alfo to Mr Kirwan a table for this purpofe.

The moft concentrated fate into which it can eafily be brought is fuch, that 1000 grains of it confifts of 563 grains of water and 437 of dry acid. In this ftate its fpecific gravity is 1,557 . Let this be called nitrous acid.
\begin{tabular}{|c|c|c|c|c|c|}
\hline \multirow[t]{7}{*}{Nitr. Ac. 10} & \multicolumn{2}{|r|}{Water.} & \multirow[b]{2}{*}{1,557} & \multirow[b]{2}{*}{1,557} & \\
\hline & X & \(\bigcirc\) & & & \\
\hline & & 1 & 1,474 & 1,474 & \\
\hline & & 6 & 1,350 & I, 273 & 0,077 \\
\hline & & 11 & 1,269 & 1,191 & 0,078 \\
\hline & & 16 & 1,214 & 1,147 & 0,067 \\
\hline & & 21 & 1,175 & 1,120 & 0,055 \\
\hline & & 26 & 1,151 & 1, IOI & 0,250 \\
\hline & & 31 & 1, 127 & 1,087 & 0,040 \\
\hline & & 36 & 1,106 & 1,077 & 0,029 \\
\hline & & 41 & 1,086 & 1,068 & 0,018 \\
\hline
\end{tabular}

There is not the fame uniformity in the denfities of this acid in its different ftates of dilution. This feems owing to the yariable proportion of the deleterious and wital air which compofe this acid. It is more denfe in
proportion as it contains more of the latter ingre. dient.

The proportions of the aeriform ingredients of the muriatic acid are fo very variable, and fo little under our command, that we cannot frame tables of its fpecific gravity which would enable us to judge of its ftrength.

It is a general property of thefe acids, that they are more expanfible by heat as they are more concentrated.

There is another clafs of fluids which it would be of great confequence to reduce to fome rules with refpect to \{pecific gravity, namely, the folutions of falts, gums, and refins. It is interefting to the philofopher to know in what manuer falts are contained in thefe watery folutions, and to difcover the relation between their frength and denfity; and to the man of bufinefs it would be a moft defirable thing to have a criterion of the quantity of falt in any brine, or of extractible matter in a decoction. It would be equally defirable to thofe who are to purchafe them as to thofe who manu. facture or employ them. Perhaps we might afcertain in this way the value of fugar, depending on the quantity of fweetening matter which it contains; a thing which at prefent refts on the vague determination of the eye or palate. It would therefore be doing a great fervice to the public, if fome intelligent perfon would undertake a train of experiments with this view. Accuracy alone is required; and it may be left to the philofophers to compare the facts, and draw the confequences refpecting the internal arrangement of the particks

One circumflance in the folution of falts is very general ; and we are inclined, for ferious reafons, to think it univerfal : this is a diminution of bulk. This indeed in fome falts is inconfiderable. Sedative falt, for inftance, hardly fhows any diminution, and might be confidered as an exception, were it not the fingle inftance. This circumftance, and fome confiderations connected with our notions of this kind of folution, difpofe us to think that this falt differs in contraction from others only in degree, and that there is fome, though it was not fenfible, in the experiments hitherto made.

Thefe experiments, indeed, have not been numerous. Thofe of Mr Achard of Berlin, and of Dr Richard Watfon of Cambridge, are perhaps the only ones of which we have a defcriptive narration, by which we can judge of the validity of the inferences drawn from them. The fubject is not fufceptible of much accuracy; for falts in their folid form are feldom free from cavities and thivery interlices, which do not admit the water on their firt immerfion, and thereby appear of greater bulk when we attempt to meafure their fpecific gravity by weighing them in fluids which do not diffolve them, fuch as fpirits of turpentine. They alfo attach to them. felves, with confiderable tenacity, a quantity of atmofpheric air, which merely adheres, but makes no part of their compofition. This efcapes in the act of folution, being fet at liberty by the ftronger affinity of the water. Sal gem, however, and a few others, may be very accurately meafured; and in thefe inftances the degree of contraction is very conftant.

The following experiments of Dr Watfon appear to us the mof inftructive as to this circumftance. A glafs veffel was ufed, having a nender cylindrical neck, and. bolding 67 ounces of pure water when filled to a cer-

\section*{S PE \\ [ 671 ] \\ S P E}
tain mark. The neck above this mark had a feale of equal parts pafted on it. It was filled to the mark with water. Twenty four pennyweights of falt were thrown into it as fpeedily as poffible, and the bulk of the falt was meafured by the elevation of the water. Every thing was attended to which could retard the immediate folution, that the error arifing from the folution of the firft particles, before the reft could be put in, might be as fmall as poffible; and in order that both the abfolute bulk and its variations misht be obtained by fome known feale, 24 pennyweights of water were put in. This raifed the furface 58 parts of the fcale. Now we know exactly the bulk of 24 pennyweights of pure water. It is 2,275 cubic inches; and thus we obtain every thing in abfolute meafures: And by comparing the bulk of each falt, both at its firft immerfion and after its complete folution, we obtain its fpecific gravity, and the change made on it in paffing from a folid to a fluid form. The tollowing table is an abftract of thefe experiments. The firt column of numbers is the elevation of the furface immediately after immerfion; the fecond gives the elevation when the falt is completely diffolved ; and the third and fourth columns are the fpecific gravities of the falts in thefe two ftates.

Twenty-four Pennyweights.

\end{tabular}

The infpecton of this lift naturally fuggefts two fates of the cafe as particularly interefting to the philofopher ftudying the theory of folution. The firft ftate is when the lixivium approaches to faturation. In the very point of faturation any addition of falt retains its bulk unchanged. In diluted brines, we fhall fee that the denfity of the fluid falt is greater, and gradually diminifhes as we add more falt. It is an important queftion, Whether this diminution goes on centinually, till the Auid denfity of the falt is the fame with its folid denfity? or, Whether there is an abrupt paffage from fome
degree of the one to the fixed degree of the other, as we obferve in the freezing of aron, the fetting of ftucco, and fome other inftances ?

The other interefting ftate is that of extreme dilution, when the differences between the fucceffive denfio ties bear a great proportion to the denfities themfelves, and thus enable the mathematician to afcertain with fome precifion the variations of corpufcular force, in confequence of a variation of diftance between the particles. 'The fketch of an inveftigation of this important queftion given by Bofcovich, in his 'Theory of Natural Philofophy, is very promifing, and fhould incite the philofophical chemift to the ftudy. The firt thing to be done is to compare the law of fpecific gravity; that is, the relation between the fpecific gravity and quantity of falt held in folution.

Wifhing to make this work as ufeful as poffible, we have fearched for experiments, and trains of experiments, on the denfity of the many brines which make important articles of commerce; but we were mortio fied by the fcantinefs of the information, and difappeinted in our hopes of being able to combine the detached obfervations, fuited to the immediate views of their authors, in fuch a manner as to deduce from them fcales (as they may be called) of their frength. We rarely found thefe detached obfervations attended with circumitances which would connect them with others; and there was frequently fuch a difcrepancy, nay oppofition, in feriefes of experiments made for afcertaining the relation between the denfity and the ftrength, that we could not obtain general principles which enable us to conftruct tables of ftrength à priori.

Mr Lambert, one of the firlt mathematicians and philofophers of Europe, in a differtation in the Berlin Memoirs ( 1762 ), gives a narration of experiments on the brines of common falt, from which he deduces a very great condenfation, which he attributes to an abforption. in the weak brines of the falt, or a lodgement of its particles in the interttices of the particles of water. Mr Achard of the fame academy, in 1785 , gives a very great lift of experiments on the bulks of various brines made in a differeut way, which fhow no fuch introfufception ; and Dr Watfon, formerly regius profeffor of chemiftry at Cambridge, and now bihop of Landaff, thinks this contirmed by experiments which he narrates in his Chemical Effays. We fee great rea. fon for hefitating our affent to either fide, and do not think the experiments decifive. We incline to Mr Lambert's opinion; for this reafon, that in the fucceffive dilutions of oil of vitriol and aquafortis there is a moft evident and remarkable condenfation. Now what are thele but brines, of which we have not been able to get the faline ingredient in a feparate form? The experiments of Mr Achard and Dr WatIon were made in fuch a way that a fingle grain in the meafure ment bore too great a proportion to the whole changeof fpecific gravity. At the fame time, fome of Dr Watfon's are fo fimple in their nature that it is very: difficult to with hold the affent.

In this fate of uncertainty, in a fubject which: feems to us to be of public importance, we thought. it our duty to undertake a train of experiments to which recourfe may always be had. Works like this are feldom confidered as fources of original informas. tion; and it is thought fufficient when the knove

\section*{5 P E}

Breeffe Graviry.
qedge already diffufed is judicionily compiled. But
a due refpect for the public, and gratitude for the very honourable reception hitherto given to our labours, induce us to exert ourfelves with honet zeal to merit the continuance of public favour. We affure our readers that the experiments were made with care, and on quantities fufficiently large to make the unavoidable irregularities in fuch cafes quite infignificant. The law of denfity was afcertained in each fubftance in two ways. We diffolved different portions of falt in the fame quantity of water, and examined the fpecific gravity of the brine by weighing it in a veffel with a narrow neck. 'I'he portions of falt were each of them oneeighth of what would make a nearly faturated folution of the temperature 55. We did not make the brine ftronger, that there might be no rifk of a precipitation in form of cryftals. We confidered the fpecific giavities as the ordinates of a curve, of which the abfciffx were the numbers of ounces of dry falt contained in a cubic foot of the brine. Having thus obtained eight ordinates correfponding to \(\mathrm{I}, 2,3,4,5,6,7\), and 8 portions of falt, the ordinates or fpecific gravities for every other proportion of falt were had by the ufual methods of interpofition.

The other method was, by firt making, a brine nearly faturated, in which the proportion of falt and water was exactly determined. We then took out one-eighth of the brine, and filled up the veffel with water, taking care that the mixture fhould be complete: for which purpofe, befides agitation, the diluted brine was allowed to remain 24 hours before weighing. Taking out one-eighth of the brine alfo takes out one eighth of the falt; fo that the proportion of falt and water in the diluted brine was known. It was now weighed, and thus we determined the fpecific gravity for a new proportion of falt and water.

We then took out one-feventh of the brine. It is evident that this takes out one-eighth of the original quantity of falt ; an abftraction equal to the former. We filled the veffel with water with the faine precautions; and in the fame manner we proceeded till there remained only one-eighth of the original quantity of falt.

The fpecific gravities by thefe two methods agreed extremely well. In the very deliquefcent falts the firf method exhibited fome fmall irregularities, arifing from the unequal quantities of water which they had imbibed from the atmofphere. We therefore confided moft in the experiments made with diluted brines.

That the reader may judge of the authority of the tables which we fhall intert, we fubmit to his infpection one feries of experiments.

Two thoufand one hundred and eighty-eight grains of very pure and dry (but not decrepitated) common falt, prepared in large cryftals, were diffolved in 6562 grains of diftilled water of the temperature \(55^{\circ}\). A fmall matrafs with a narrow neck, which held 4200 grains of diftilled water, was filled with this brine. Its contents weighed 5027 grains. Now \(6562+21 \times 8\) \(: 2188=5027: 1256,75\). Therefore the bottle of brine contained 1256,75 grains of falt diffolved in 3770,25 grains of water. Its fpecific gravity is \(=\) \(\frac{5027}{4200}\), or 1,196905 ; and a cubic foot of brine weighs E196,9 ounces avoirdupois. Alfo 5027:1256,75=
\(119^{5,9: 199,28 . ~ T h e r e f o r e ~ a ~ c u b i a ~ f o o t ~ o f ~ t h i s ~ b r i n e ~}\) contains 299,28 ounces of perfectly dry fait.

The fubfequent iteps of the procefs are reprefented as follows.

\end{tabular}

Thus, by repeated abftraction of brine, fo as always to take out \(\frac{1}{8}\) th of the falt contained in one conftant bulk, we have obtained a brine confifting of 157 grains of falt united with \(43^{13-157}\), or 4156 grains of water. Its \{pecific gravity is \(\frac{4313}{4200}=1,0279\), and a cubic foot of it weighs 1028 ounces, and contains \(37 \frac{4}{\mathrm{TO}}\) ounces of dry falt. In like manner may the fpecific gravity, the weight of a cubic foot, and the falt it contains, be eftimated for the intermediate brines.

When thefe eight quantities of falt contained in a cubic foot are made the abfciffr, and the weights of the cubic foot of brine are the correfponding ordinates, the

\section*{S P E [ 673 ] S P E}
curre will be found to be extremely regular, refembling a hyperbolic arch' whofe affymptote makes an angle of \(30^{\circ}\) with the axis. Ordinates were then interpolated analytically for every 10 ounces of contained falt, and thus the table was conftructed. We did not, however, reft it on one feries alone; but made others, in which \(\frac{x}{4}\) th of the falt was repeatedly abitracted. They agreed, in the cafe of common falt, with great exactnefs, and in fome others there were fome very inconfiderable irregularities.

To fhow the authority of the tables of ftrength was by no means our only motive for giving an example of the procefs. It may be of ufe as a pattern for fimilar experiments. But, befides, it is very inftructive. We fee, in the firf place, that there is a very fenfible change of denfity in one or both of the ingredients. For the feries is of that nature (as we have formerly explained), that if the ingredients retained their denfities in every proportion of commixture, the \{pecific gravities would have been in arithmetical progreffion; whereas we fee that their differences continually diminifh as the brines grow more denfe. We can form fome notion of this by comparing the different brines. Thus in the firt brine, weighing 5027 grains, there are 3770 grains of water in a veffel holding 4200 . If the denfity of the water remains the fame, there is left for the falt only as much fpace as would hold 430 grains of water. In this fpace are lodged 1257 grains of falt, and its fpecific gravity, in its liquid form, is \(\frac{1257}{430}=2,8907\) very nearly. But in the 8th brine the quantity of water is 4556 , the face left for 157 grains of falt is ouly the bulk of 44 grains of water, and the denfity of the falt is \(\frac{157}{44}=3,568\), confiderably greater than before. This induced us to continue the dilution of the brine as follows, beginning with the 8 th brine.
\begin{tabular}{|c|c|}
\hline \multirow[t]{4}{*}{\[
\begin{aligned}
& 157 \\
& 78,5
\end{aligned}

\hline & 2156,5 \\
\hline & 2105,5 \\
\hline \multirow[t]{3}{*}{\[
\begin{aligned}
& 78,5 \\
& 39,7
\end{aligned}
\]} & 2) 4262,0 ' 9 th brine \\
\hline & 2131 \\
\hline & 2131
2102 \\
\hline \multirow[t]{4}{*}{39,7} & 2)4233 roth brine \\
\hline & 2116,5 \\
\hline & 2116,5 \\
\hline & 2102 \\
\hline 19,8 & 4218 11th brine. \\
\hline
\end{tabular}

This laft brine contains 4198,2 grains of water, leaving only the bulk of 1,8 grains of water to contain 19,8 of falt, fo that the falt is ten times denfer than water. This will make the ftrength 243 inftead of 210 indicated by the fpecific gravity. But we do not pretend to meafure the denfities with accuracy in thefe diluted brines. It is evident from the procefs that a fingle grain of excefs or defect in taking out the brine

Voz. XVIF. Part II.
and replacing it with water has a fenfible proportion to the whole variation. But \(\bar{w} e\) fee with fufficient evidence, that from the frong to the weak brines the fpace left for the portion of falt is continually diminifhing. In the firf dilition \(5^{2} 7^{\frac{1}{2}}\) grains of water were added to fill up the veffel; but \(\frac{1}{8}\) th of its contents of pure water is only 525 : fo that here is a diminution of \(2 \frac{x}{2}\) grains in the fpace occupied by the remaining falt. The fublequent additions are 604,\(7 ; 706,5 ; 847\); 1054,5;1405;2102;2105,5;2102;2102; inftead of \(600 ; 700 ; 840 ; 1050 ; 1400 ; 2100 ; 2100\); 2100; 2100. Nothing can more plainly fhow the condenfation in general, though we do not learn whether it happens in one or both of the ingredients ; nor do the experimente fhow with fufficient accuracy the proyreffion of this diminution. The exceffes of the added water being only fix or feven grains, we cannot expect a nice repartition. When the brine is taken out, the upper part of the veffel remains lined with 2 briny film containing a portion of falt and water, perhaps equal or fuperior to the differences. Had our time permitted, we fhould have examined this matter with fcrupulous attention, ufing a veffel with a ftill narrower rueck, and in each dilution abftracting one half of. the brine. The eurve, whole abfiffre and ordinates reprefent the weight of the contained falt and the weight of a conftant bulk of the brine, exhibits the beft and moft fynoptical view of the law of condenfation, becaufe the pofition of the tangent in any point, or the value of the fymbol \(\stackrel{\dot{x}}{-\dot{y}}\), always fhows the rate at which the fpecific gravity increafes or diminifhes. We are inclined to think that the curve in all cafes is of the hyperbolic kind, and complete; that is, having the tangent perpendicular to the axis at the beginning of the curve. The mathematical reader will eafily guefs the phyfical notions which incline us to this opinion; and will alfo fee that it is hardly poffible to difcover this experimentally, becaufe the miftake of a fingle grain in the very fmali ordinates will change the pofition of the tangent many degrees. It was for this reafon that we thought it ufelefs to profecute the dilution any farther. But we think that it may be profecuted much farther in Dr Watfon's or Mr Achard's method, viz. by diffolving equal weights of falt in two veffels, of very different capacities, having tubular necks, in which the change of bulk may be very accurately obferved. We can only conclude, that the condenfation is greateft in the ftrongeft brines, and probably attains its maximum when the quantities of true faline matter and water are nearly equal, as in the cafe of vio triolic acid, \&c.

We confider thefe experiments as abundantly fufficient for deciding the queftion "Whether the falt can be received into the pores of the water, or the water into the pores of the falt, fo as to increafe its weight without increafing its bulk?" and we muft grant that it may. We do not mean that it is fimply lodged in the pores as fand is lodged in the intertices of fmall for ; but the two together occupy lefs room than when feparate. The experiments of Mr Achard were infufficient for a decifion, becaufe made on fo fmall a quantity as 600 grains of water. Dr Watfon's experiments'have, for the moft part, the fame defect. Some of them, however, are of great value in this queftion, and are very fit for afcer-
\(4 Q\).... tating

Specific Gravity.

\section*{S P E [ 674 ] S P E}

Specifie Eeavity.
taining the fpecific gravity of diffolved falts. In one of them (not particularly narrated) he found that a quantity of diffolved falt occupied the fame bulk in two very different flates of dilution. We cannot pretend to reconcile this with our experiments. We have given thefe as they ftood; and we think them conclufive, becaufe they were fo numerous and fo perfectly confitent with each other; and their refult is fo general, shat we have not found an exception. Common falt is by no means the moft remarkable inftance of condenfation. Vegetable alkali, fal ammoniac, and fome others, exhibit much greater condenfation.

We thought this a proper opportunity of confidering this queftion, which is intimately connected with the principles of chemical folution, and was not perhaps confidered in fufficient detail under the article Chemistry. We learn from it in general, that the quantities of falt in brines increafe at fomewhat a greater xate than their feecifc gravities. This difference is in many cafes of fenfible importànce in a commercial view. Thus an alkaline lixivium for the purpoles of bleaching or foap-making, whofe feccific gravity is 1,234 , or exceeds that of water by 234 , contains 351 ounces of falt in a cubic foot; a ley, which exceeds the weight of water twice as much, or 468 ounces per cubic foot, contains 777 ounces of falt, which exceeds the double of 361 by 55 ounces more than 7 per cent. Hence we learn, that hydrometers for difcovering the frength of brines, having equal divifions on a cylindrical ftem, are very erroneous; for even if the increments of \{pecific gravity were proportional to the quantities of falt in a gallon of brine, the divifions at the bottom of the ftem ought to be fimaller than thofe above.

The conftruction of the following table of Atrengths froin the above narrated feries of brines is fufficiently obvious. Column Ift is the fpecific gravity as difcovered by the balance or hydometer, and afo is the number of ounces in a cubic foot of the brine. Col. 2d is the Qunces of the dry falt contained in it.

The table differs confiderably from Mr Lambert's The quantities of falt correfponding to any fpecific gravity are about \(\frac{T^{2}}{8}\) th lefs than in his table. But the zeader will fee that they correfpond with the feries of
experiments above narrated; and thefe were but a few of many which all correfponded within an hundredth part. The caufe of the difference feems to be, that moft kinds of common falt contain magnefian falts, which contain a very great proportion of water neceffary for their cryftallization. The falt which we ufed was of the pureft kind, but fuch as may be had from every falt work, by Lord Duadonald's very eafy procefs, viz. by paffing through it a faturated folution boiling hot, which carries off with it about \(\frac{4}{5}\) ths of all the bitter falts. Our aim being to afcertain the quantities of pure feafalt, and to learn by the by its relation to water in refpect of denfity, we thought it neceffary to ufe the pureft falt. We alfo dried it for feveral days in a fove, fo that it contained no water not abfolutely neceffary for its cryftallization. An ounce of fuch falt will com. municate a greater fpecific gravity to water than an ounce of a falt that is lefs pure, or that contains extra. neous water.

The feecific gravity 1,090 is that of ordinary pickles, which are eftimated as to frength by floating an egg.

We cannot raife the fpecific gravity higher than 1,206 by fimply diffolving falt in cold water. By it will become much denfer, and will even attain the fpe. cific gravity 1,240 by boiling, then holding about 366 ounces in the cubic foot of hot brinte. But it will depofir by cooling, and when of the temperature \(55^{\circ}\) or \(60^{\circ}\). hardly exceeds 1,206 . We obtained a brine by boiling till the falt grained very' rapidly. When it cooled to \(60^{\circ}\), its \{pecific gravity was, 2053 ; for a veffel which held 3506 grains of diftilled water held 4229 of this brine. This was evaporated to drynefs, and there were obtained 1344 grains of falt. By this was computed the number interpofed bet ween 310 and 320 in the table. We have however raifed the fpecific gravity to 1,217 , by putting in no more falt than was neceflary for this denfity, and ufing heat. It then cooled duwn to \(60^{\circ}\) without quitting any falt ; but if a few grains of falt be thrown into this brine, it will quickly depolit a great deal more, and its denfity will decreafe to 1,206 . We find this to hold in all falts; and it is a very inftructive fact in the theory of cryftallization ; it refembles the effeet which a magnet produces upon iron filings in its neighbourhood. It makes them temporary magnets, and caufes them to arrange themfelves as if they had been really made permanent magnets. Jult fo a cryftal already formed difpofes the reft to cryftallize. We imagine that this analogy is complete, and that the forces are fimilar in both cafes.

The above table is computed for the temperature \(55^{\circ}\); but in other temperatures the firength will be different on two accounts, viz. the expanfion of the brine and the diffolving power of the water. Water expands about 40 parts in 1000 when heated from. \(60^{\circ}\) to \(212^{\circ}\). Saturated brine expands about 48 parts, or \(\frac{1}{5}\) th more than water; and this excefs of expanfion is nearly proportional to the quantity of falt in the brine. If therefore any circumftance fhould obli,e us- to examine a brine in a temperature much above \(60^{\circ}\), allowance fhould be made for this. Thus, fhould the feecific gravity of brine of the temperature \({ }^{1} 30\) (which is nearly half way between 60 and 212) be ', 140 , we mûft. increafe it by 20 (half of 4c); and having found the ftrength 24 . correfponding to this corrected fpecific gravity, we muft correct it again by adding I to the fpecific gravity for every 45 ounces of falt.

\section*{SP E}
\(S\) PE

But a much greater and more uncertain correction is neceffary on account of the variation of the diffolving power of water by heat. This indeed is very fall in the cafe of fea-falt in companion with other falts. We prefume that our readers are apprifed of this peculiarity of fea-falt, that it diffolves nearly in equal quantities in hot or in cold water. But although water of the termperature 60 will not diffolve more than 320 or 325 ounces of the purest and dryef fea.falt, it will take up above 20 ounces more by boiling on it. When thus faturated to the utmoft, and allowed to cool, it does not quit any of it till it is far cooled, viz. near to \(60^{\circ}\), It then depofits this redundant fall, and holds the reft till it is juft going to freeze, when it lets it go in the infant of freezing. If evaporated in the fate in which it continues to hold the flt, it will yield above 400 ounces per cubic foot of brine, in good cryfals, but rathe overcharged with water. And fence in this fate the cubic foot of brine weighs about 1220 ounces, it follows, that 820 ounces of water will, by boiling, ifSolve 400 of crystallized flt.

The table flows how much any brine mut be boiled down in order to grain. Havingobferved its Specific gravity, find in the table the quantity of flt corresponding. Call this \(x\). Then, fince a boiling hot graining or fatrated folution contains 340 ounces in the cubic foot of brine, fay \(340: 1000=x: \frac{1000}{340} x\). This is the bulk to which every cubic foot (valued at 1000 ) mut be boiled down. Thus fuppofe the brine has the fpecific gravity II Dg. It holds 160 ounces per foot, and we mull boil it down to \(\frac{1000 \times 160}{340}\) or 471 ; that is, we muff boil off \(\frac{529}{1000}\) of every cubic foot or gallon.

There remarks are of importance in the manufacture of common fat; they ? enable us to appretiate the valuce of fall firings, and to know how far it may be prusdent to engage in the manufacture. For the doctrine of latent heat affures us, that in order to boil off a certain quantity of water, a certain quantity of heat is indiıpenfably neceffary. After the mot judicious applecation of this heat, the consumption of fuel may be too expenfive.

The Specific gravity of fea-water in the fe climates does not exceed 1,03 , or the cubic foot weighs 1030 ounces, and it contains about 41 ounces of flt. 'the brinepits in England are vaftly richer; but in many parts of the world brines are boiled for fat which do not contain above 10 or 20 ounces in the cubic foot.

In buying falt by weight, it is of importance to know the degree of humidity. A fat will appear pretty dry (if free from magnefia fats) though moistend with I per cent. of water; and it is found that incipient humidity exposes it much to farther deliquefcence. A much faller degree of humidity may be difcovered'by the Specific gravity of a brine made with a few ounces of the fat. And the infection of the table informs us that the brine should be weak; for the differences of Specific gravity go on diminifhing in the ftronger brines: 300 ounces of dry fat diffolved in 897 ounces of water flould give the Specific gravity I197. Suppofe it be but 1190 , the quantity of fall correfponding is only 290 ; but when mixed with 897 -ounces of water, the weight is 1197 , although the
weight of the cubic foot is only 1190 . There is therefore more than a cubic foot of the brine, and there is as much fat as will make more than a cubic foot of the G avity. weight 190 . There is \(290 \times \frac{197}{1190}\), or \(291 \frac{2}{3}\) ounces \({ }_{0}\) and there is \(8 \frac{1}{3}\) ounces of water attached to the fat.

The various information which we have pointed out as deducible from a knowledge of the fpecific gravity of the brings of common fall, will ferve to fuggeft feveral advantages of the knowledge of this circumstance in other lixivia. We hall not therefore refume them, but fimply give another table or two of fuch as are molt interefting. Of those alkaline leys are the chief, being of extenfive use in bleaching, foap-making, glafs-making, \&c.

We therefore made a very flong ley of the pureft vegetable alkali that is ever unfed in the manufactories, not thinking it neceflary, or even proper, to take it in its fate of utmoft purity, as obtained from cubic nitre and the like. We took fall of tartar from the apothecary, perfectly dry, of which \(39^{8} 3\) grains were diffolved in \(354^{\circ}\) grains of distilled water ; and after agitation for feveral days, and then flanding to deposit fediment, the clear ley was decanted. It was again agitated ; becaufe, when of this ftrength, it becomes, in a very fthort time, rarer above and denfer at the bottom. A flak containing 4200 grains of water held 616 g of this ley when of the temperature \(55^{\circ}\). Its fpecific gravity was therefore 1,4678 , and the 6165 grains of ley contained 3264 grain of flt. We examined its fpecific gravity in differrent fates of dilution, till we came to a brine containing 51 grains ot fat, and 4189 grains of water, and the contents of the flak weighed 4240 grains: its Specific gravity was therefore 1,0095 . In this train of experiments the progreffion was molt regular and fatistactory; fo that when we constructed the curve of specific gravities geometrically, none of the points deviated from a molt regular curve. It was confiderably more incurvated near its commencement than the curve for fea-falt, indicating a much greater condenfation in the diluted bines. We think that the following table, conftructed in the fame manner as that for common fall, may be depended on as very exact.

We

\section*{S P E}

Specific Gravity.

We fee the fame augmentation of the denfity of the falt in the diluted brines here as in the cafe of commont falt. Thus a brine, of which the cubic foot weiphs \(14^{82}\) ounces, or which has the fpecific gravity 1,482 , contains 800 ounces of dry alkali and 682 of water. Therefore, if we fuppofe the denfity of the water unchanged, there remains the bulk of 318 ounces of water to receive 840 ounces of falt: its denfity is therefore \(\frac{800}{318}\) \(=2,512\) nearly. But in the brine whofe weight per foot is only 1016 there are 20 ounces of falt, and therefore 996 of water ; and there is only four ounce-meafures of water, that is, the bulk of four ounces of water, to receive 20 ounces of falt. Its fpecific gravity therefore is \(\frac{23}{4},=5\), almof twice as great as in the ftrong brinc. Accordingly Mr Achard is difpofed to admit the abforption (as jt is carelefsly termed) in the cafe of fal tart. But it is a general (we think an univerfal) fact in the folution of falts. It muft be carefully diftinguifhed from the firf contraction of bulk which falts undergo in paffing from a folid to a fluid form. The contraction now under confideration is analogous to the contraction of oil of virtriol when diluted with water; for oil of vitriol muft be confidered as a very ftrong brine which we cannot dephlegmate by diftillation, and therefore cannot obtain the dry faline ingredient in a feparate form, fo as to obferve its folid denfity, and fay how much it contracts in firf becoming fluid. The way of conceiving the firft contraction in the act of folution as a lodging of the particles of the one ingredient on the interltices of the other, "ou ils fe nichent, en augmentant Te poids fans affecter le volume de la faumure," as Eller and Lambert exprefs themfelves, is impoffible here, when both are flivids. Indeed it is but a flovenly way of thinking in either cafe, and fhould be avoided, becaufe inadvertent perfons are apt to ufe as a phyfical principle what is merely a mode of feech.

We learn from the table, that a hydrometer with equidiftant divifions on a cylindrical or prifmatical ftem is ftill more erroneous than in the brines of common falt.

We learn from the experiments of Kirwan, Lavoifier, and others, that dry falt of tartar contains about \(\frac{x}{4}\) th of its weight of fixed air. In many applications of this falt to the purpofes of manufacture, this ingredient is of no ufe. In fome it is hurtful, and muft be abtracted by lime. Soap-maker's ley confifts of the pure alka. line falt diffolved in water. It is therefore of importance to afcertain its quantity by means of the fpecific gravity of the brine. For this purpofe, we took a ley of fal tart. whofe fpecific gravity was 1,20417 , containing 314 oz . of mild alkali in a cubic foot of ley, and we rendered it nearly cauftic by lime. The feecific gravity was then 1,1897 . This is a very unexpected refult. Nothing is employed with more fuccefs than quick. lime for dephlegmating any watery fluid. We fhould rather have expected an increafe of fpecific gravity by the abftraction of fome of the water of the menftruum, and perhaps the water of the cryftallization, and the. aerial part of the falt. But we mult afcribe this to the great denfity in which the fixed air exifts in the mild alkali.

It is unneceffary to give fimilar tables for all the falts, unlefs we were writing a differtation on the theory of their folution. We fhall only obferve, that we examined with particular attention fal ammoniac, becaufe Mr Achard, who denies what is called the abforption of
falts, finds himfelf obliged to allow fonething like it in this falt. It does not, however, differ from thofe of which we have given an account in detail in any other refpect than this, that the changes of fluid denfity are much lefs than in others (inftead of being greater, as Achard's experiments feem to indicate) in all brines of moderate ftrength. But in the very weak brines there is indeed a remarkable difference; and if we have not committed an error in our examination, the addition of one part of fal ammoniac to 64 of water occupies lefs room than the water alone. We think that we have met with this as an accicental remark by fome author, whofe work we do not recollect. liut we do not choofe to reft fo much on our form of the experiment in fuch weak brines. The following mixtures will abundantly ferve for conftructing the table of its frergth: Sal ammoniac \(=960\) grains was diffolved in 3506 grains of water, making a brine of 4466 grains. A phial which held 1600 grains water held 1698 of this brine. It contained \(\frac{1698 \times 960}{4466}\), or 365 grains of falt. The fpecific gravity was \(\frac{1698}{1600}=1,061\), and the cubic foot weighed 1061 ounces. It alfo contained \(\frac{1061 \times}{1698} \frac{365}{}\), or 228 ounces of falt. By repeated abftraction of brine, and replacing with water, we had the following feries :
\begin{tabular}{lccc} 
Series. & Brine. & Sp. Gr. & \begin{tabular}{c} 
Oz. Salt \\
in
\end{tabular} \\
Cub. F.
\end{tabular}

This feries is extremely regular, and the progrefs of denfity may be confidently deduced from it.

From the whole of this difquifition on the relation between the fpecific gravities of brines and the quantities of falt contained, we fee in general that it may be gueffed at, with a ufeful degree of precifion, from the denfity or fpecific gravity of faturated folutions. We therefore con* clude with a lift of the fecific gravities of feveral faturated folutions, made with great care by the bifhop of Landaff.-Thetemperature was \(42^{\circ}\). The firt numerical columan is the denfity of faturated brine, and the next is the denfity of a brine coufifting of 12 parts (by weight) of water and one of falt. From this may be inferred the quantity in the faturated folution, and from this again may, be inferred the quantity correfponding to inferior denfities.

\section*{S P E [ 677 ] S P E}
tacles : SPECTACLES, in dioptrics, a machine confifting defects of thes fet in filver, horn, \&cc. to affirit the who have fat organ of fight. Old people, and others the rays of light converge fo as to meet upon the reaure or \({ }^{\text {g }}\) o as to mcet upon the retina: lenfes for fpectacles, which caufes the rays to divere and prevent their mecting ere they reach to diverge, See Optics, no 73.
Ocular SPECTRA, images prefented to the eye after 1 emoving them from a bright object, or clofing them. When any one has long and attentively looked at a bright object, as at the fetting fun, on clofing his eyes, or removing them, an image, which refembles in form the object he was artending to, continues fome time to be vilible. This appearance in the eye we fhall call the ocular fpectrum of that object.
Thefe ocular fpectra are of four kinds: Ift, Such as are owing to a lefs fenfibility of a defined part of the retina or fpectra from defect of fenfibility. 2 d , Such as are owing to a greater fenfibility of a defined part of the retina, or fpectra from excefs of fenlibility. 3 d, Suçh as refemble their object in its colour as well as form ; which may be termed direct ocular fpectra. \(4^{\text {thl, }}\), Such \(2 s\) are of a colour contrary to that of their object, which may be termed reverfe ocular fpectra.
SPECTRE, an apparition, fomething made preternaturally vifible to human fight, whether the ghofts of dead men or beings fuperior to man.

A belief that fupernatural beings fometimes make themfelves vifible, and that the dead fometimes revifit the living, has prevailed amang moft nations, efpecially in the rudeft flages of fociety. It was common among the Jews, among- the Greeks, and among the Romans, as we find from the Scripturcs, and from the poerms of Homer and Virgil. Celeftial appearances were indeed fo often exhibited to the Jews, that the origin of their belief is not difficult to be explained. The Divine Being manifetted himfelf to each of the Pa triarchs by fome fenfible fign, generally by a flame of fire, as he did to Mofes. Under this femblance alfo did he appear to the Irraelites during their abode in the defert, and after they obtained a fettlement in the land of Canaan. Nor did they believe that heavenly beings alone affumed a fenfible eppearance: They believed that deceafed men alfo fometimes revifited this world. When Saul went to confult the witch at Endor, he afked her to bring up the perfon whom he fhould name unto her; a proof that he confidered his demand as eafy to be performed, and therefore that he probably acted under the influence of popular opinion. The fame opinions had been generally entertained at a much ealier period; for necromancy and witchcraft, the arts by which the dead were fuppofed to be raifed, had been prohibited while the Ifraelites were in the wildernefs, and yet untainted with the vices of the Canaanites. They muft therefore have derived them from Egypt, the cradle of supertition, as well as of the arts and fciences.

Among the Greeks and Romans the apparition of fpectres was generally believed. On innumerable occafions the gods are faid to have diicovered themfelves to the eyes of mortals, to have held conferences, and to have interpofed their aid. The ghofts of the dead, too, are faid to have appeared. When Tneas, amidtt the diftraction and confution of his mind in flying from the
deftruction of Troy, had loft his wife by the way, he returned in fearch of her. Her fhade appeared to him (for fhe herfelf had been flain) with the fame afpect as before, but her figure was larger. She endeavoured to affuage the grief of her unhappy hufband, by afcribing her death to the appointment of the gods, and by foretelling the illuftrious honours which yet awaited him. But when .Eneas attempted to clafp her in his arms, the phantom immediately vanifhed into air. From this flory we may obferve, that the ancients believed that the umbre or fhades, retained nearly the fame appearance after death as béfore; that they had fo far the refemblance of a. body as to be vifible; that they could think and fpeak asformerly, but could not be touched. This deffription applies equally well to thofe fhades which had paffed the river Styx, and taken up their refidence in the infernal. regions. Such were the fhades of Dido, of Deiphobus, and all thofe which Eneas met with in his journey through the fubterraneous world.
It appcars from the writings of modern travellers who have vifited rude and favage nations, that the belief of fpectres is po lefs common among them. Mr Bruce tells us, that the prieft of the Nile affirmed, that he hadmore than once feen the firit of the river in the form of an old man with a white beard. Among the Mahometans the doctrine of fpectres feems to be reduced to. a regular fyftem, by the accounts. which they give of genii. Whoever has read the Arabian Nights Entertainments mult have furnifhed his memory with a thoufand inftances of this kind. Their opinions concerning genii feem to be a corrupted mixture of the doctrines of the Jews and ancient Perfians. In Chriftian countries, too, notwihhtanding the additional light which their religion has fpread, and the great improvement in the fciences to which it has been fubfervient, the belief of ghofts and apparitions is very general, efpecially amiong the lower ranks. They believe that evil fpirits fome times make their appearance in order to terrify wicked men, efpecially thofe who have committed murder. They fuppofe that the firits of dead men affume acorporeal appearance, hover about church yards and the houfes of the deceafed, or haunt the places where murders have been committed. (See Grost.) In fome places it is believed that beings have been feen bearing a. peifcet refemblance to men.alive. In the Highlands of Scotland, what is called the fecond fiyht is ftill believed by many (fee Second Sight); ;iz. that future events. are foretold by certain individuals by means of fecetral reprefentation.
So general has the belief of fpectres been, that this circumftance alone may be thought by fome fufficient to prove that it.mult have its foundation in human nature, or muft reft upon rational evidence. When any doa trine has been univerfally received by all nations, by generations living feveral thoufand years from one an. other, and by people in all the different flages of focie. ty, there is certainly the ftrongefl prefumption to conclude that fuch a doctrine has its foundation in reafon and in truth. In this way we argue in favour of theexiftence of a God, concerning moral. diftinction, and the doctrine of a future flate: : and certainly. fo far we argue well. But if the fame. argument be applied toidolatry, to facrifices, or to apparitions, we fhall find that it is applied improperly. Idolatry was very general. among ancient nations ; fo was the offering of facrificea)

\section*{S P E [ \(678 \quad] \quad\) S P E}
speetre. fo was polytheifm : but they were by no means univerfal. Should we allow, for the fake of fhortening the argument, that all ancient, nations were polytheits and idolaters, and prefented oblations to their imaginary deities, all that could be concluded from this conceffion is, that they fell into thefe miftakes from their ignorance and from the rude fate of fociety, from which their imperfect knowiedge of theology and moral philofophy was never able to refcue them. Thefe erroneous notions fled before the brightnefs of the Chriftian fyftem; while the doctrines of the exiftence of God, of moral diftinction, and of a future ftate, have been more thoreughly confirmed and afcertained. The fame thing may be faid of the belief of fpectres. However generally it has been adopted in the firt ftages of fociety, or by civilized nations who had made but little progrefs in the ftudy of divine things, it has been rejected, we may fay invariably, wherever theology and philofophy have gone fand in hand.

As all popular and long eftablifhed opinions are objects of curiofity and refearch for the philofopher, we think the belief of fectres worthy of foze attention even in this light. It will therefore, we hope, give fome fatisfaction to the philofophical reader to fee a fhort account of the fources or principles from which this belief is derived. But as the belief of fpectres is connected with other opinions which appear to us highly injurious to religion; opinions which have been fupported by many learned men, and which are ftill believed by fome men of literary education-it will alfo be proper, in the firft place, to confider the evidence on which this belief refts, in which we muft confider both their probability and credibility.

In the prefent inveftigation we mean to fet afide altogether the celeftial appearances recorded in Scripture, as being founded on unqueftionable evidence, and perfectly agreeable to thofe rules by which the Deity acts in the ufual courfe of his Providence. The Ifraelites, during the exiftence of their fate, were inmediately under the authority of God, not only as the moral governor of the world, but as the king of Ifrael. In the infancy of the world, while men were rude and unenlightened, and entirely under the influence of idolatry, many revelations were neceffary to preferve in their minds pure ideas of the nature of God, and of the worthip due to Him. They were neceflary allo to pavg the way for that illuftrious difpenfation which the Lord Jefus came from Heaven to diffufe over the world. Every celeftial appearance recorded in Scripture was exhibited for fome wife and important purpore, which muft be apparent to every perfon who confiders thefe appearances with attention. But when the Scriptures were written and publifhed, and the Chriftian religion fully eftablifhed, revelation ceafed, and miracles and heavenly meffages were no longer requifite. What credit then ought we to give to thofe marvellous fories related in ancient authors concerning prodigies in the heavens, and the apparition of angels both good and bad?

It is not pretended that any of thofe prodigies and appearances were exhibited for purpofes equally great and important with thofe which are defcribed in Scripture : And can we fuppofe that the all-wife Governor of the World would permit his angels to render themfelves wifible to the eyeof man for no purpofe at all, or for a purpofe which might have been equally well accomplifhed
without their interpofition? Would this be confiftent sped with perfect wifdom, or would it be confiftent even with the excellence and fuperiority of undertanding which we are taught to arcribe to thefe elevated beings? The whole will of God is revealed to us in the Scriptures; what further ufe for the vifible interpofition of angels? It may be objected, Are they not all miniftering fpirits fent forth to minifter for them who Thall be heirs of falvation §? We anfwer, That angels may animate and § Heb fupport good men by an invifible interpofition. But 14 . the A poitle is not fpeaking of celeftial fpirits. The word arysios fignifies "a meffenger ;" and in Scripture often refers to men. In the paffage which we are now reviewing it certainly is applied with much more propriety to men than to angels: for the Apofle is fating a comparifon between the Prophets, by whom God, at fundry times and in divers manners, fpake in time patt to the fathers, and the Son, by whom he hath fpoken in thefe laft days.

And if God has given no commiffion to his angels to deliver to men fince the publication of the Chritian religion, is there any probability that he would give any commiffion or any licence to evil fpirits? It will be faid, that this doctrine is clearly taught in the New Teftament, in thefe words, "The devil goeth about as a roaring lion feeking whom he may devour." We will not avail ourfelves of the interpretation of-fome, who fay that the word devil, which in the Greek language fignifies an adverfary, or flanderer, refers here to fome human being, who was a violent enemy of the Chriftians. All that can be deduced from the fe words, upon the fuppofition that they refer to a malignaut fpirit, is merely that he goeth about feducing men to vice. But it is not by affuming a hideous form, and prefenting himfelf to the midnight traveller, that fuch a purpofe is to be accomplifhed. A fpirit may probably have direct accefs to our minds without the intervention of any thing corporeal; and by exciting our paffions may plunge us into vice, which is the only object fuch a being is fuppofed to have in view. None of the marvellous ftories which we have heard concerning the apparition of evil fpirits lead us to conclude that they appear to entice men to commit crimes. We never heard of any evil fpirits that required men to fteal, to perpetrate robbery or murder. They only appeared to terrify fome crazy timorous individuals, who have whims and fancies enow of their own to agitate their minds, though no preternatural vifion fhould ever appear to them. It is not confiftent, therefore, with the character of God, and what he has revealed to us of his will, to believe that he would commiffion good angels, or permit evil angels, to appear to men firce the propagation of the gofpel, or indeed at any former period of the world, unlefs fome great and mighty purpofe was to be fulfilled. It is not confiftent with what we know of the nature of good or bad angels to fuppofe, that though permiffion were granted them occafionally to fhow themfelves to men, that they would appear in that way which ftorytellers defcribe.

It is equally improbable that the fpirits of the dead who have removed from this world fhould again be permitted to vifit it. At death men undergo as great, perhaps a greater change, than when they came firt into the light of the fun. Is it not therefore as improbable that a'man should return in a vifible corporeal

\section*{S P E}
form after death, as that, after having arrived at manhood, he fhould return to the flate in which he was before his birth? Such changes as thefe are evidently made permanent by the invariable laws of nature. But fuppofe it were poffible, for what purpofe fhould they return? To deferibe to us what is paffing in the other world, to animate us to virtue, by informing us of the rewards which there await the good; or to alarm us, by defribing the punifhment of the wicked. Thefe feem important reafons. But Divine Providence has wifely thrown a veil over futurity. We know every thing of the other world from the feripture which it is proper for us at prefent to know. And as to incentives to virtue, we are already bleffed with a number fufficiently great and powerful for moral beings, who are to act from rational motives, and not from compulfion. "He that will not hear Mofes and the prophets, will not be perfuaded though one rofe from the dead."
There is one ftrong objection againft the probability of fpectres, which is fufficient to prove that they are not intelligent creatures; or at leaft that they poffers fo fimall a degree of intelligence, that they are unqualified to act with prudence, to propofe any end to themfelves, or ufe the proper means to accomplifh that end. Ghofts often appear in order to difcover fome crime that has been committed: but they never appear to a magitrate, or perfon ii authority, but to fome illiterate clown, who happenis to live near the place where the crime was perpetrated; to fome perfon who has no connection with the affair at all, and who in general is the moft improper in the world for making the difcovery. For inftance,' in Glanville's Saducifmus triumph; aths (a book written in the lait century by a chap. lain of Charles II. in fupport of the common opinions relpecting witchcraft and apparitions), we have the following ftory : James Haddock, a farmer, was married to Elenor Wellh, by whom he had a fon. After the death of Hatdock, his wife married one Davis; and both agreed to defraud the fon by the former màrriage of a leafe bequeathed to him by his father. Upon this the ghof of Haddock appeared to one Francis Taverner the fervant of lord Chichefter, and defired him to go to Elenor Welfh, and to inform her that it was the will of her former hufband that their fon fhould enjoy the leafe. Taverner did not at firt execute this commiffion; but he was continually haunted by the apparition in the moft hideous fhapes, which even threatened to tear him in pieces, till at laft he delivered the meffage. Now, had this fpectre had the leaf common fenfe, it would have appeared firt to Elenor Welth and her hufband Davis, and frightened them into compliance at once, and not have kept poor Taverner in fuch conftant difquietude, who had no concern in the matter.

Another very odd circumftance refpecting appazitions in general muft not be omitted, which is, that they have no power to fpeak till they are addreffed. In the 27 th of Glanville's Relations we read of an old woman that appeared often to. David Hunter, a neat-herd, at the houre of the "iffop of Down and Contiers. Whenever fhe appeared, he found himfelt obliged to follow her ; and for three quarters of a year poor David ipent the whole of almoft every night in fcampering up and down through the woods after this old woman. How long this extraordinary employment might have conti-
nued, it is impolible to guefs, had not David's violent spectre. fatigue made him one nirht exclaim, "Lord blefs me! would I were dead!-fhall I never be delivered from this mifery!" On which the phantom replied, "Lord blefs me too! It was happy you fpoke firlt, for till then I had no power to fpeak, though I have followed you fo long." Then fhe gave him a meffaye to her two. fons, though David told her he remembered nothing about her. David, it feems, neglected to deliver the meffage; at which the old beldam was fo much provoked. that fhe returned and hit him a hearty bloiv on the froulder, which made him cry out, and then fpeak. to her. Now if fhe could not fpeak till David addreffed her, why might fhe not have applied this orato-
rial rial medicine the firft time the appeared to him ? It would have faved both herfelr and him many a weary journey; and certainly David would nuch rather have had even half a dozen of blows from her choppy fitts than have wanted fo many nights fleep. To complete the floty, we muf add, that when David's wife found it impoffible to keep him from following the troublefome vifitor, the trudged after him, but never was gratified with a fi ght of the enchantrefs. David's little dog too was a dutiful attendant on his mafter during his pilgria mage.

It is remarked by Glanville, that ghofts are generally very eager to be gone: Indeed they are often fo muck. fo, that they do not flay to tell their errand. One would be induced from this, as well as the circumftan. ces already mentioned, to think that they are the ftupideft and duileft of the dead that affume the appearance of ghofts ; unlefs we adopt the ingenious folution of Glanville, "that it is a very hard and painful thing for ther to force their thin and tenuious bodies into a vifible confiftence ; that their bodies muft needs be exceedingly compreffed; and that therefore they mult be in hafte to be delivered from the unnatural preffine."
With refpect to the evidence in favour of fpectres, if examined ever fo dightly, it will be found very defective. They only appear to one perfon at a time; they are feen only in the night; they are vifible ouly. to ighorant, illiterate, and credulous perfons, and never prefent themfelves before men of education and learning.

That fpectres only appear to one perfon at a time, even though there are more in company, is an objection againit the credibility of their appearance quite infurinountable. How is it poffible that two men of eye-. fight equally good, directing their eyes to the lame fpot, fhould not fee fo large an object. as that of a man. or woman at a fmall diftance equally well ? Some will tell us that a milt is caft over the eyes of the one, while the -view of the other is free from obftruction. But how is this to be proved? and befites what purpofe would it ferve? Ghofts have feldom any fecrets to difclofe ; they might be proclaimed to a multitude with as. much propriety as confined to one perfon. Shall we be told, that the fpectre has the power of becoming vifible to fome, and of remaining invifible to others? This cannot be allowed without adopting opinions deAtructive to revealed religion ; for it would he a miracle : and we cannot be perluaded, without evidence, that God would empower any inferior being to controul at pleafure the wife laws which he has oidained for governin? the world. To him who is of a different opinion, we
woulà:

\section*{S Pl E}

Spectre. would recommend Farmer on Miracles; a book in which this queftion is fully examined.

Spectres appear only in the nighit. But why fhould they fhur the lipht of the fun? Thofe mifchievous ghofts that Glanville mentions might indeed have fome reaion to choofe midnight for the execution of their pranks, as they would be more eafily detected iu open day. Such was the roguifh drummer that haunted Mr Mompeffon's houfe, who beat his drum all night, threw the old gentlewoman's clothes about the room, hid her Bible in the afhes, plucked the clothes off the bed, and amufed himfelf with toffing about Mr Mom. peffon's fhoes. But why thould a grave ferious ghoft appear at midnight? Might it not deliver its meffage with as much eafe and more fuccefs in the day-time ? In the day-time it would not excite much fear; it would be liftened to therefore with more attention; and did it choofe to exhibit itfelf before a number of witneffes, its grievances would be more fpeedily redreffed, becaufe more perfons would intereft themfelves in feeing juftice done to the injured ghoft.

Spectres not only choofe the mof improper time, Wut the moft improper perfons. To render the teftimony of arry perfon credible, he muft not only be a man of veracity, but he mult have fufficient ability to judge of the fubject to which he is to bear witnefs. It is not on the evidence of an ignorant illiterate perfon, who has more fancy and fear than judgment, that we are to reft our belief of what is fupernatural It is alfo worthy of remark, that we have never heard of a ghoft appearing to any perfon who did not previounly believe their exiftence. A man muft be prejudiced in favour of this opinion, or he will never fee a ghoft. But fenfible men know, that he who has been accultomed to hear frightful ftories of ghofts and apparitions gliding thro' a church-yard, or haunting fome particular place, can fcarcely pafs through a church-yard or haunted fpot without conjuring up in his imagination the hideous phantoms which he has been accuftomed to alfociate with fuch places. Is it Arange, then, that an ignorant man, with a mind uncultivated and uninformed, with all the prejudices of the nurfery about him, fhould imagine he fees ghofts in thofe places where he believes they hover, efpecially in the dead hour of midnight, when, with the dighteft aid of the imagination, a cow
may be turned into a monflrous phantom, and the reflection of the beams of the moon from a little water be converted into a ghoft with a winding fheet? But why fhould apparitions fhun men of uudertanding and learning? Why fhould learning be formidable to them (A)? It was not fo with the celeltial meffengers mentioned in the Scriptures : they appeared to the patriarchs and prophets; and the miracles there recorded were performed in the molt public places, before the eyes of Rabbies, of Scribes, and Pharifees. Indeed this circumftance is fufficient to deftroy the evidence of fpectres. They have never been feen by any but men of weak or diftempered minds, or by men who have previoufly believed in them.

Having now conlidered the evidence on which the belief of ipectres refts, we will endeavour to give fome account of the foundation of it. To trace an opinion that has prevailed fo generally in the world to its fource, is a labour not unworthy of the philofopher, even tho' the opinion be falfe. It is always gratifying to detect the caufes of error: it is no lefs ufeful; for in order to refute error, it is often fufficient to point out the fources from which it has fprung. To reach the origin of the belief of ipectres is not more difficult than to account for idolatry or polytheifm. In the infant fate of the intellectual powers every thing is confidered as poffeffing life and intelliyence. The child beats the ftool over which he has fallen with the fame paffion that he would treat his companion: The young girl talks to her doll as if it underitood her: 'The favages afcribe every change which they obferve on the face of nature to the action of fume animated being. As knowledge advances, they fingle out thofe beings'which feem to produce the moft itriking effects, arrange them into fome kind of order, and divide the governinent of the world among them. Unable, at the fame time, to conceive any notion of a pure fpirit, they imavine thofe divinities are corporeal beings. This is the foundation of idolatry. The belief of feectres is but another ftep. That thefe animated corporeal beings, to whom they addrefs their prayers, and who prefide over the world, fhould on particular occafions difplay themfelves to the human eye, is what they mult be previoully difpofed to expect. Hence the numberlefs appearances of the heathen gods, of the Perfian and Mahometan genii. The
(A) The celebrated hitorian De Thou had a very fingular adventure at Saumur, in the year 1598. One night, having retired to reft very much fatigued, while he was enjoyigg a found fleep, he felt a very extraordinary weight upon his feet, which, haviny made him turn fuddenly, fell down and awakened him. At firft he imagined that it had been only a dream, but hearing foon after fome noife in his chamber, he drew afide the curtains, and faw, by help of the moon, which at that time fhone very bright, a large white figure walking up and down, and at the fame time obferved upon a chair fome rags, which he thought belonged to thieves who had come to rob him. The figure then approaching his bed, he had the courage to alk it what it was. "I am (faid it) the Queen of Heaven." Had fuch a figure appeared to any credulous ignorant man in the dead of night, and made fuch a fpeech, would he not have trembled with fear, and have frightened the whole neighbourhood with a marvellous defrription of it? But De Thou had too much undertanding to be fo impofed upon. Upon hearing the words which dropped from the figure, he immediately concluded that it was fome mad woman, got up, called his fervants, and ordered them to turn her out of doors; after which he returned to bed and fell afleep. Next morning he found that he had not been deceived in his conjecture, and that having forgot to thut his door, this female figure had efcaped from her keepers, and entered his apartment. The brave Schomberg, to whom De Thou related his adventure fome days after, confeffed that in fuch a cafe he would not have fhown fo much courage. The king alfo, who was informed of it by Schomberg, made the farme acknowledgement.

\section*{S P E}

\section*{[ 681 ]}

S P E
are. belief of ghofts may be eafily deduced from the opinions entertained relpecting a future flate. Thefe opinions are founded on that effential doctrine of natural religion, that there is another world in which men flall exitt wherr death has removed them hence. This doctrine has been univerfally received both by favage and civilized nations; but, as might be expected, men have formed very different fentiments concerning the nature of a future ftate, of the fituation and employments of departed fpirits, according to the degree of knowledge which they poffeffed. But the general opinion in an. cient and rude nations was, that departed fpirits retained the fame external appearance, the fame paffions and principles as before. Nothing therefore was more natural than the opinion, that they might occafionally revifit this world, from an anxious defire, to alleviate the fufferings of thofe beloved friends and relations whom they had left behind them, or to communicate from the unfeen world what might be important to their welfare. Upon fuch an errand did Creuifa appear to Encas. The apparition of the ghofts of murderers is eatily explained upon the fame general principles. The remorfe and horror of mind which the murderer feels are fuppofed to haunt him in the other world, and to render his fituation there intolerable (efpecially if the murder was never detected and punifhed), till he return and give information againft limeffe. In this way, then, we thiuk it highly"probable the belief of fpectres has originated. But many other caufes concur to confirm and propagate this belief. Thefe are, imperfect vifion united with fear, dreams, opium, difeafes, drunkennefs, and artifice.
1. Indiftinct vifion is one fource of apparitions, efpecially when the mind is under the influence of fear. It is well known, that the fenfe of feeing conveys no idea of diftance till improved by experience and obfervation; and how we come at length to diftinguirh objects at a diftance from thofe that are near, has been explained in another place (fee Metaphysics, \(\mathrm{n}^{\circ} 50\) ).

In the day-time we feldom commit miftakes, becaufe we know the object at which we look; but at night, when we fee objects obfcurely, and know not what they are, we have no diftinct idea either of their diffances or of their magnitude. We may miftake a bufh that is near us for a tree at a diftance ; or if the imagination be under the influence of fear, it will eafily convert it into a gigantic figure." It is generally afferted (fays Buffon) that thefe figures exift only in the imagiuation; yet they may have a real exittence in the eye; for whenever we have no other mode of judging of an unknown object but by the angle it forms in the eye, its magnitude will uniformly increafe in proportion to its propinquity. If it appears, when at the diftance of 20 or 30 paces, to be only a few feet high, its height, when within two or three feet of the eye, will be many fathoms. An object of this kind muft naturally excite terror and aftonifhment in the fpectator, till he approaches and recognifes it by actual feeling; for the moment a man knows Vol. XVII. Part II.
an object, the gigantic appearance it affumed in the eye inftantly diminifhes, and its apparent magnitude is reduced to its real dimenfions. But if, inftead of approaching fuch an object, the fpeciator flies from it, he can have no other idea of it but from the image whick it formed in his eye; and, in this cafe, he may affirm with truth that he faw an object terrible in its afpect, and enormous in its fize. Thus the notions concerning fpectres is founded in nature, and depend not, as fome philofophers affirm, upon the imagination alone."
In addition to thefe obfervations of Buffon, we may take notice, that objects are always magnified in a fog; fo that when a fog happens in the night-time, objects may be magnified to an enormouss fize. But, at any rate, whether there be fog in the night or not, there is fuch a great analogy between darknefs and a fog, that if the latter deceive us with refpect to the fize of objects, the former will alfo deceive us. The writer of this article was paffing the Frith of Forth at Queens.îry, near Edinburgh, one morning which was extremely foggy. Though the water be only two miles broad, the boat did not get within fight of the fouthern fhore till it approached very near it. He then faw to his great furprife a large perpendicular rock, where he knew the fhore was low and almoft flat. As the boat advanced a little nearer, the rock feemed to fplit perpendicularly into portions, which feparated at a little diftance from one another. He next faw thefe perpendicular divifions move; and upon approaching a little nearer, found it was a number of people flanding on the beach, waiting the arrival of the ferry-boat.
2. Dreams are another fertile fource of apparitions. It is well known to every perfon, that while the mind is under the influence of a dream it confiders it as much a reality as it does any particular action while awake. Now if a perfon of a weak fupertitious mind fhould have a very lively dream, which interefts his paffions, particularly the paffion of fear, it may make fo deep an impreffion, that he may be firmly convinced that he has actually feen with his eyes what has only paffed before his imagination (See Apparition) (b). We fhall here tell a ftory, by way of illurtration, which we have received on unquettionable authority. An Eaft Indian captain liad an honef faithful fervant named Fobn, for whom he had a great regard. John died, if we recollect right, on a voyage from England to the Eaft Indies during a French war. As the fhip approached the place of its deftination the captain had a dream, in which John appeared to him, and earnefly befought him not to fail to the port. for which he was bound, as it was in the hands of the French. The captain, though not addicted to fupertition, thought it prudent to follow this admonition; and after landing at a different port, he was informed that the place to which he lad intended to fteer was, according to the information of the dream, captured by the French. On the voyage home, the captain had a fecond dream, in which John again appeared to him, and gave him no4 R
(в) When the thoughts are much troubled, and when a perfon fleeps without the circumfances of going to bed, or putting off his clothes, as when he nods in his chair, it is wery difficult, as Hobbes remarks, to diftinguifh a dream from a reality. On the contrary, he that compofes himfelf to fleep, in cafe of any uncouth ar abfurd fancy; eafily fufpects it to have been a dream, -Leviathan, par. i. c. 1.

\section*{S P E [682] S P E}

Spectre, tice that he frould foon die, and that the fhip thould be taken in the mouth of the Channel by the French. Next morning the captain called his firft mate, told him his dream, which he believed was prophetic, and delivered his papers, that he might take proper care of them after his deceafe. Every thing happened exactly as the dream had foretold; the captain died, and the veffel was taken by a Frenclı man of war in the mouth of the Channel. This drenm, wonderful as it appears, is eafly explained. In the voyage out to India, no thing was more natural than that the captain flowld fometimes be thinking, that amidt the various chances of war, the port to which he was bound might be taken; perhaps it was a place of confequence, which the French might be eager to poffefs. The captain being accuftomed to revolve thefe thoughts in the day-time, they would naturally return at night ; the regret which he felt for the lofs of a faithful' fervant might mingle with his apprehenfions, and thus produce the dream. Perhaps the advice was fuch as John would have given had he been alive. It is equally eafy to explain the caufe of the dream in the paffage home. The captain, we are told, was very ill, and thought himfelf dying, at the very time he had the fecond drean, and thereSore did not expect to reach England. This part of the dream, then, was only his own thoughts, delivered by his fervant. As to the other part, that his fhip fhould be taken in the mouth of the Channel, it may be thought unaccountable how the very place Thould be forefeen. But we muft recoilect, that the mouth of the Channel, being over againft the coaft of France, was by far the moft dangerous place in the whole paffage; and that, therefore, the captain had more reafon to be afraid of lofing his fhip there than in any other place. The ufe which we mean to make of this fory is this: Had the captain been a man of a tveak mind, he would certainly have confidered the dream as a reality, and believed, that inftead of having dreamed of the things on which his imagination had dwelled, he had actually feen his fervant return from the dead, and heard him deliver the meffage. But, on the other hand, the captain, though he believed the dream was prophetic, mentioned it without any figns of fear; and no man of courage and reflection ever fees an apparition. This fight is referved for the weak, the timid, and fuperfitious. Of this many inflances might be mentioned.
3. Spectres are fonetimes alfo occafioned by opium. Gaffendi the philofopher found a number of people going to put a man to Aeath for having intercourfe with the devil ; a crime which the poor wretch readily acknowledged. Gaffendi begged of the people that they would permit him firf to examine the wizard before putting him to death. They did fo; and Gaffendi, upon examination, found that the man firmly believed himfelf guilty of this impoffible crime. He even offered to Gaffendi to introduce him to the devil. The philofopher agreed; and when midnight came, the man gave him a pill, which he faid it was neceflary to fwallow before fetting off. Gaffendi took the pill, but gave it to his dog. The man having fwallowed his, fell into a profound fleep; during which he feemed much agitated by dreams. The dog was affected in a fimilar manwer. When the man awoke, he congratulated Gafo
fendi on the favourable reception he had met with from his fable highnefs. It was with difficulty Gaffendi convinced him that the whole was a dream, the effeet of foporific medicines, and that he had never ftirred from one fpot during the whole night.
4. That difeafes, efpecially the night-mare, the hypochondria, hyfteric paffion, and madnefs, are another fource of fpcteres, we have the ftrongeft reafon to affirm, Perfons fubject to the night-mare often imagine that they fee fpectres. This is ftill more the cafe with hypochondriac and hyfteric perfons, and thofe who are in any degree deranged in their intellects. A fact which fell within the obfervation of the writer of this article will Both prove and illuftrate this affertion. In a village in one of the midland counties of Scotland, lived a widow diftingnithed among her neighbours for decency of manners, integrity, and refpect for religion. She affirmed, that for feveral nights together the had heard a fupernatural voice exclaiming aloud, Murder! murder!' This was immediately reported throngh the neighbourhood; all were alarmed, and looked around them with folicitude for the detection of the murder which they fuppofed to have been committed; and it was not long till a difcovery feemed aceually to be made. It was reported, that a gentleman, who had relations at no great diftance, and had been refiding in the Weft Indies, had lately arrived with a confiderable fortune; that he had lodged in an inn about three miles off; and that he had afterwards been feen entering a houfe in the village where the widow lived, from which he had never returned. It was next affirmed, that a tradefman paffing the church-yard about twelve at midnight had feen four men carry a dead corpfe into that cemetery. Thefe three facts being joined together feemed perfectly to agree and to confirm one another, and all believed fome horrible murder had been committed. The selations of the gentleman thought they were called upon to make inquiry into the truth of thefe allegations: they accordingly came firft to the church-yard, where, in company with the fexton, they exanined all the graves with great care, in order to difcover whether any of them had been lately dug, or had the appearance of containing more than one coffin. But this fearch was to no purpofe, for no alteration had been made upon the graves. It was next reported that the murdered man had been buried in a plantation about a mile diffant from the village. As the alarm was now very general, a number of the inhabitants propofed of their own accord to explore it. They accordingly fpread themfelves over the wood, and fearched it with care, but no grave nor new dug earth was found. 'The writer of this article, whe was then a boy at fchool, was along with them. The matter did not reft here: The perfon who was faid to have feen four men carry a dead corpfe into the church-yard at midnight was fummoned to appear before a meeting of the juttices of the peace. Upon examination he denied any knowledge of the affair, but referred the court to another perfon from whom he had received his information. This perfon was examined, and the refult was the fame as the former. In fhort, one perfon had heard it from another, who had received it from a third, who had heard it from a fourth; but it had received a little ombellifhment from every perfon who

\section*{S P E}

Are, repeated it. It turned out to be the fame with Smollet's ftory' of the three black crows, which fome body was faid to have vomited.
Upon inquiry at the inn where the Weft Indian gentleman had lodged, no fuch gentleman had been feen there. It was found afterwards he had never left the Weft Indies. Still, however, the veracity of the widow was not difputed; and fome dark and fecret tranfaction was fufpected. But the whole affair was at length explained by difcovering that fhe was fomewhat deranged by melancholy. And the eries which the had at firt imagined fhe had heard were afterwards: in itated by fome roguifh perfon, who was highly amuled with fpreading terror among the credulous.
5. Drunkennefs alfo has the power of creating fpectres. Its natural effeet in moft cafes is to derange the underflanding, to throw it off its guard, and to give full fcope to that paffion which has a natural difpolition to gain an afcendancy; and fometimes it excites paffions which fcarcely feem to exift at any other time. It makes fome men licentious, fome furious, fome all benevolence and kindnefs, fome from being cowards it renders undaunted heroes. It feldom, if ever, excites fear ; and therefore it may be thought ftrange that men fhould imagine they fee ghofts when intoxicated. But it mult be remarked, that the ghofts which the drunkard fees, he fees not with the fame alarm and terror as men who are fober. He is not afraid of them. He has the courage to converfe with them, and even to fight with them, if they give him provocation. A man returning home intoxicated, affirmed that he had met with the devil; and that after a fevere encounter he had vanquifhed him and brought him to the ground, to which he had nailed him faft by driving hia ftaff through his body. Next morning the ftaff was found fluck with great violence into a heap of turfs !
6. Many apparitions of fpectres have no other origin than the artifices of the waggith or felf.interefted. Dr Plot, in his Natural Hiftory of Oxfordfhire, relates a marvellous ftory, which will illuftrate this affertion. Soon after the murder of King Charles I. a commiffion was appointed to furvey the king's houfe at Woodflock, with the manor, park, woods, and other demefnes to that manor belonging; and one Collins, under a feigned name, hired himfelf as fecretary to the commiffioners, who, upon the \(13{ }^{\text {th }}\) of Oetober 1649 , met, and took up their refidence in the king's own rooms. His majefty's bed-chamber they made their kitchen, the council hall their pantry, and the prefence-chamber was the place where they fat for the difpatch of bufinefs. His majety's dining-room they made their wood-yard, and fored it with the wood of the famous royal-oak from the High Park, which, that nothing might be left with the name of king about it, they had dug up by the roots, and fplit and bundled up into faggots for their firing. Things being thus prepared, they fat on the 16 th of the fame month for the difpatch of bufinefs 1 ; and in the midft of their firft debate there entered a large black dog (as they thought), which made a dreadful howling, overturned two or theee of their chairs, and then crept under a bed and vanifhed. This gave them the greater furprife, as the doore were kept conAtantly locked, fo that no real dog could get in or out. The next day their furprife was increafed, when fitting ot dinner in a lower room, they heard plainly the noile
of perfons walking over their heads, though they well knew the doors were all locked, and there could be no of the king's oak brought by parcels from the diningroom, and thrown with great violence into the prefence chamber; as alfo all the chairs, ftools, tables, and other furniture, forcibly hurled about the room; their papers, containing the minutes of their tranfactions, were torn, and the ink-glafs broken. When all this noife had ceafed, Giles Sharp, their fecretary, propofed to enter firft into thefe rooms; and in prefence of the commiffioners, from whom he received the key, he opened the doors, and found the wood fpread about the room, the chairs toffed about and broken, the papers torn, the ink-glafs broken (as has been faid), but not the leaft tract of any human creature, nor the leaft reafon to fufpect one, as the doors were all faft, and the keys in the cuftody of the commiffioners. It was therefore unanimoufly agreed, that the power who did this mifchief muft have entered the room at the key-hole. The night following, Sharp the fecretary, with two of the commiffioners fervants, as they were in bed in the fame room, which room was contiguous to that where the commiffioners lay, had their bed's feet lifted up fo much higher than their heads, that they expected to have their necks broken, and then they were let fall at once with fo much violence as fhook the ywhole houfe, and more than ever terrified the commiffioners. On the night of the 19 th, as all were in bed in the fame room for greater fafety, and lights burning by them, the candles in"an inftant went out with a fulphureous fmell, and that moment many trenchers of wood were hurled about the room, which next morning were found to be the fame their honours had eaten on the day before, which were all removed from the pantry, though not a lock was found opened in the whole houfe. The next night they fill fared worfe; the candles went out as before, the curtains of their honours beds were rattled to and fro with great violence; their honours received many cruel blows and bruifes, by eight great perter-difhes and a number of wooden trenchers being thrown on their beds, which being heaved off, were heard rolling about the room, though in the morning none of thefo were to be feen. This night likewife they were alarmed with the tumbling down of oaken billets about their beds, and other frightful noifes; but all was clear in the morning, as if no fuch thing happened. The next. night the keeper of the king's houfe and his dog lay in the commiffioners room, and the they had no difturbance. But on the night of the 22d, though the dog lay in the room as before, yet the candles went out, \({ }^{\boldsymbol{a}}\) number of brick-bats fell from the chimney into the noom, the dog howled piteoully, their bed clothes were all ftripped off, and their terror increafed. On the 24th they thought all the wood of the kin's's oak was violently thrown down by their bed-fides; they counted 64 billets that fell; and fome hit and frook the beds in which they lay; but in the morning none were found there, nor had the door been opened where the billet wood was kept. The next night the caudles were put out, the curtains rattled, and a dreadful crack like thunder was heard; and one of the fervants running in hafte, thinking his mafter was killed, found three dozen of trenchers laid fmoothly under the quilt by him. But all this was nothing to what fucceeded afterwards: The 29th, about midnight, the candles went out, fomething walked majeftically through the room, and opened and fhut the windows; great ftgnes were thrown violently into the room, fome of which fell on the beds, others on the floor; and at about a quarter after onc a noife was heard as of forty caunon difcharged to ather, and again repeated at about cight minutes diffance. This alarmed and raifed all the neighbourhood, who coming into their honours room, gathered up the great ftones, fourfeore in number, and laid them by in the corner of a field, where, in Dr Plot's time, who reports this fory, they were to be feen. This noife, like the difcharge of cannon, was heard through all the country for 16 miles round. During thefe noifes, which were heard in both rooms together, the commiffoncrs and their fervants gave one another over for loft, and cried out for help; and Giles Sharp, fnatching up a fword, had well nigh killed one of their honours, miftaking him for the fpirit, as he cane in his fhirt from his own room to theirs. While they were together, the noife was continued, and part of the tiling of the houfe was ftript off, and all the windows of an upper room were taken away with it. On the 3oth at midnight fomething walked into the chamber treading like a bear; it walked many times about, then threw the warming-pan violently on the floor; at the fame time a large quantity of broken glafs, accompanicd with great ftones and horfes bones, came pouring into the room with uncommon force. Thefe were all found in the morning to the aftonifhment and terror of the commiffioners, who were yet determined to go on with their bufinefs. But on the firt of November the moft dreadful focne of all enfued: Candles in every part of the room were lighted up, and a great fire made ; at midnight, the candles all yet burning, a noife like-the burtting of a cannon was heard in the room, and the burning billets were toffed about by it even into their honours beds; who called Giles and his companions to their relief, otherwife the baufe had been burnt to the ground; about on hour after the candles went out as ufual, the crack ns if many cannon was heard, and many pailfuls of grecn ftinking water were thrown upon their honours beds; great fones were alfo thrown in as before, the bed curtains and bedfteads torn and broken, the windows fhattered, and the whole neighbourhood alarmed with the moft dreadful noifcs; nay, the yery rabbitStealers that were abroad that night in the warren were fo terrified, that they fled for fear and left their ferrets behind them. One of their honours this night fpoke, and, in the name of God, afked what it was, and why it - Nifurbed them fo? No anfwer was given to this; but the noife ceafed for a while, when the fpirit came again; and, as they all agreed, brought with it feven devils worfe than itfelf. Oue of the fervants now lighted a large candle, and fet it in the door-way between the two chambers, to fee what paffed; and as he watched it, he plainly faw a hoof friking the candle and candleftick into the middle of the room, and afterwards ma. king three fcrapes over the fnuff, fcraped it out. Upon this the fame perfon was fo bold as to draw a fword; but he had fcarce got it out when he felt another invifible hand holding it too, and pulling it from him ; and at length prevailing, ftruck him fo violently on the head with the pummel, that he fell down for dead with the blow. At this inftant was heard another burt like
the difcharge of the broadfide of a chip of war, and at about a minute or two's diftance each no lefs that ig more fuch : thefe fhook the houfe fo violently, that they expected every moment it would fall upon their heads. The neighbours, on this, as has been faid, being all alarmed, flocked to the houfc in great numbers, and all joined in prayer and pfalm-finging ; during which the noife ftill continued in the other rooms, and the dif. charge of cannons was heard as from without, though no vifible agent was feen to difcharge them. But what was the moft alarming of all, and put an end to their proceedings effectually, happened the next day as they were all at dinner, when a paper, in which they had figned a mutual agreement to referve a part of the premifes out of the general furvey, and afterwards to fhare it equally amongtt themfelves, (which paper they had hid for the prefent under the earth in a pot in one corner of the room, and in which an orange-tree grew), was confumed in a wonderful manner, by the earth's taking fire with which the pot was filled, and buining violently with a blue fume, and an intolerable ftench; fo that they were all driven out of the houfe, to which they could never be again prevailed upon to return.

This wonderful contrivance was all the invention of the memorable Jofeph Collins of Oxford, otherwife called Funny Foe, who having hircd himfelf as fecretary, under the name of Giles Sharp, by knowing the pri* vate traps belonging to the houfe, and the help of pulvis fulminans and other chemical preparations, and lettiug his fellow-fervants into the fcheme, earried on the deceit without difcovery to the very laft; infomuch that the late Dr Plot, in his Natural Hiftory, relates the whole for fact, and concludes in this grave manner, "That though tricks have been often played in affairs of this kind, many of the things above related are not reconcileable with juggling; fuch as the loud noifes, beyond the power of man to make without fuch inftruments as were not there; the tearing and breaking the beds; the throwing about the fire; the hoof treading out the candle; and the ftriving for the fword, and the blow the man received from the pummel of it."
SPECULARIS lapis, in natural hiftory, a genus of talcs, compofed of large plates vifibly feparate, and of extreme thinnefs; and each fiffile again feparated into a number of plates ft:ll finer. (See Tasc.) Of this genus there are three fpecies: r. The white fhining fpecularis, with large and broad leaves, commorly called ijinglafs and Mufcovy glafs; its lamellw, or leaves, are extremely thin, elaftic, and tranfparent; it makes not the leaft effervefcence with aquafortis, and is not eafily calcined in the fire. It is imported in great quantitics; the miniature-painters cover their pictures with it ; the lantérn-makers fametimes ufe it inftead of horn; and minute objects are ufually preferved between two plates of it, for examination by the microfcope. 2. The bright brown fpecularis, with broad leaves; a very valuable fpecies, though inferior to the former. 3. The purple bright fpecularis, with broad leaves, which is the moft elegant of all the talco, and not lefs beautifully tranfparent than the firf kind.

SPECULATIVE, fomething relating to the theory of fome art or fcience, in contradiftinction to prac-
tical. tical.

SPECULUM for reflecting telefcopes, is made of a kind of white copper confifting of \(3^{2}\) parts fine

\section*{S P E}
the pure fome black tin be melted in another crucible, alfo with pour the melted tin them both from the fire, and crucible. Stir the whole fuled mafs in the large of birch, and pour off the fufed with a dry fpatula to a large quantity of cold water. The fuddentely in the water will caufe the fluid metal to divide into an infinite number of fmall particles, which will cool in. ftantly.
2. If the copper be completely faturated, the fracture of one piece of this mixed metal will appear bright, and of a gloffy look, refembling the face of pure quickfilver. But if it is of a brown reddifh colour, it wants a little more tin. Toafcertain the required proportion, melt a fmall quantity, known by weight, of the mixed metal, with a known very fmall part of tin; and, if neceffary, repeat the trial with different dozes, till the fracture of the new mixture looks as already defcribed. Having now afcertained the neceffary addition of tin that is required, proceed to the lait melting of the whole metal, together with the additional proportional dofe of tin; fufe the whole, obferving the fame cautions as before; and you will find that the mixture will melt with a much lefs heat than that for the firft fufion. Have ready as many ounces of white arfenic in coarfe powder as there are pounds in the weight of the metal; wrap up the arfenic in a fmall paper, and put it, with a pair of tongs, into the crucible; ftir it well with the fpatula, retaining the breath to ayoid the arfenical fumes or vapours (which however are not found to be hurtful to the lungs) till they difappear; take the crucible off the fire, clear away the drols from the top of the metal, pour in about one ounce of powdered rofin, with as much nitre, in order to give the metal a clean furface, and pour out the metal into the moulded flaks.
3. The fpeculum fhould be moulded with the concave furface downwards, and many fmall holes fhould be made through the fand upwards, to difcharge the air. The moulding fand from Highgate near London, ufed by the founders, is as good as any for cafting thefe metallic mirrors. The caft metal fhould be taken out from the fand of the flalks whilft it is hot, or elfe it may happen to crack if left to cool within. See'lelescope.

Speculum, a looking glafs or mirror, capable of reflecting the rays of the fun.
SPECULUM, in furgery, an inftrıment for dilating a wound, or the like, in order to examine it attentively. See Surgery.

SPEECH, in general, the art or act of expreffing a perfon's thoughts by means of articulate founds, which we. call words. See Language, Grammar, Reading, and Oratory, part iv.

SPEED (John), an eminent Englifh hiftorian, was born at Farington, in Chemire, in 1542 . He was by profeffion a taylor, and freeman of the company of mer-chant-taylors in the city of London. In 1606 , he pub. white arfenic. The procefs given by the late J. Edwards, who was rewarded by the Board of Longitude for difclofing it to the public, was publifhed in the Nautical Almanack for 1787 , and is as follows: Melt the copper in a large crucible, employing fome black flux, compofed of two parts of tartar and one of nitre ; In 1614 appeared his Hifory of Great Britaine, which has been tranflated into Latin; and in 1616 he publifhed his Cloud of Witneffes, in octavo. He lived in marriage 57 years with his wife, by whom he had twelve fons and fix daughters; and died in 1629. He was interred in the church of St Giles's, Cripplegate, London, where a monument was erected to hiśs memory.

SPEEDWELL, in botany. See Veronica.
SPELL, a charm confiting of fome words of occult power, generally attended with fome ceremony.In order to explain it, we will produce a few examples. On St Agnes's night, 2 ift of January, take a row of pins, and pull out every one, one after another, faying a Pater-nofter on fticking a pin in your fleeve, and you will dream of him or her you fhall-marry.

Another method to fee a future fpoufe in a dream: Grofe's Pro The party inquiring muft lie in a different county from vinciul Glof that in which he commonly refides, and on going te \({ }^{\text {fary. }}\) bed muft knit the left garter about the right-legged ftocking, letting the other garter and ftocking alone; and as he rehearfes the following verfes, at every comma knit a knot :

This knot I knit,
To know the thing I know not yet ;
That I may fee
The man (woman) that fhall my huband (wife) be ; How he goes, and what he wears,
And what he does all days and years.
Accordingly, in a dream, he will appear with the in: fignia of his trade or profeffion.
Another, performed by charming the moon, thus: At the firlt appearance of the new moon, immediately after the new year's day, (though fome fay any other new moon is as grood), go out in the evening, and ftand over the fpars of a gate or file, and, looking on the: moon, repeat the following lines :

All hail to the moon ! all hail to thee !
I prithee, good moon, reveal to me
I'his night who my hufband '(wife) mult' be
Immediately after you muft go to bed, when you will dream of the perfon deftined for your future hufband : or wife.

SPELLING, in grammar, that part of orthography which teaches: the true manner of refolving words into their.fyllables.

All words are either fimple or compound, as \(u f e\), difufe; done, undone; and the rules for dividing each mult be fuch as are derived. from the analogy of language in general, or from the eftablifhed cuitom of fpeaking; which, for the Englifh language, are reduced to the following rules: 1. A confonant between two vowels muft be joined with the latter in fpelling, as na-ture, ve-ri-ly, ge-nt-rous ; except, however, the letter \(x\), which is joined to the firt, as in flux-en, ox\(e n, \& \mathrm{c}\), and componnd words, as in \(u p \cdot o n, u n-u j_{\epsilon} d\), \&c. 2. A double confonant muft. be divided, as in let-ter, man-ner, \&c. 3. Thofe confonants which can begia a word muft not be parted in fpelling, as in de-frauls,

\section*{S PE}

Spelman
!
Spence.
e-prove, di-fing: however, this rule is found fometimes to fail ; for though \(g n\) begins a word, as gnazv, grat, \&c. yet it muft be divided in fpelling, as in cog-
ni-zance, ma.lig-ni-ty, \&c. 4. Thofe confonants which cannot begin a word muft be divided, as \(l d\) in fellom, It in mul-ti-tude, mp in tem-per, rd in ar-dent; but in final fyllables there are exceptions, as \(t l\) in \(t i-l l e, d l\) in bandle, \&c. 5. When two vowels come together, and are both of them diftinetly. founded, they mult be feparated in fpelling, as in co-e-val, mu-tu-al, \&c. 6. The grammatical terminations or endings mult be feparated in fpelling, as ed in rwing-ed, edff in dedi-ver-edff, ing in bear-ing, ance in de-li.ver-ance, \&c. 7. Compound words mutt be refolved into their. fimple or component words, as up-on, in-to, ne-ver-the-lefs, not-with-fanding, \&c.

SPELMAN (Sir Henry), an eminent Englifh antiquarian, was defcended from an ancient family, and born at Cengham, near Lynn in Norfolk; about the year 1561. He was knighted by king James I. who had a particular efteem for him on account of his known capacity for bufinefs; and he employed him feveral cimes in Ireland on public affairs. When he was about 50 years of age, he went to refide in London; where falling into a ftudy to which his own genius had always inclined him, lie collected all fuch books and "MSS. as concerned the fubject of antiquities, either foreign or domeftic. In 1626, he publifhed the firt part of his well-known Gloffary, which he never carried beyond the letter \(\mathcal{L}\); becaufe, as fome have fuggefted, he had faid things under "Magna charta," and "Maximum confilium," that could not then have appeared without giving offence. Upon his death all his papers came into the hands of his fon Sir John Spelman, a gentleman who had abilities to have completed his father's defign, if death had not prevented him. The fecond part was afterwards publifhed by Sir William Dugdale; but with all the marks of a fcanty unfinifhed performance. The next work he entered upon was an edition of the Englifh Councils, of which he publifhed the firft volume about two years before his death, leaving the fecond volume, as well of this as of lis Gloffary, to be publifhed by Sir Willian Dugdale. Sir Henry wrote feveral other things, all relating to ancient laws and cuftoms, and died in 1641. His Pofthumous Works were publifhed in folio, 1698, under the infpection of Mr Giblon, afterwards bifhop of London.

SPELTER, in metallurgy, the fame with Zinc.
SPENCE (Jofeph), was fellow of New College, Oxford, where he took the degree of A. M. in \(172^{\prime} \%\). About that time he became firit known as an author, by an Effay on Pope's Odyfey, in which fome particular beauties and blemifbes of that work are confidered; a work of great merit, and which for found criticifm and candid difquifition is almoft withont a parallel. He was elected profeffor of poetry by the univerfity in 1728 , and held that office ten years, which is as long as the ftatutes will allow. His Hiftory of Stephen Duck was firft publifhed in 1731 ; but it was afterwards much alftred, and prefixed to an edition of Duck's paems.

About this time he travelle? into Italy as tutor to the earl of Lincoln, a terwards duke of Newcafle.In \(173^{5}\) he republifhed Grorboduc, at Mr Pope's defire, with a preface giving an account of the author, the earl of Dorfet. He quitted his fellowihip in 1742, up- the rectory of Great Harwood in Buckinghannhire. He never refided in his living; but paid it an annual vifit, diftributing large fums of money among the poor, and providing for many of their children. The fame year he was made profeffor of modern hiftory at Oxford. In 1747 he publifhed Polymatis; oran inquiry concerning the agreement between the works of the Roman poets and the remains of ancient artifts, being an attempt to illuf trate them mutually from each other. 'I'his work was treated by Gray with a contempt which it did not deferve. He raifes objections becaufe the author did not illuftrate his fubject from Greek writers ; that is, becaufe he failed to execute what he never undertook. He was inftalled prebendary of the feventh fall at Durham the 24th May 1754. He publifhed the fame year, "An Account of the Life, Character, and Poems, of Mr Blacklock, ftudent of philofophy at Edinburgh;" which was after wards prefixed to his Poems. The profe pieces which he printed in the Mufeum he collected and publifhed, together with fome others, in a pamphlet called Moralities, by Sir Harry Beaumont. Under the fame name he publifhed "Crito, or a dialogue on beauty," and "A particular Account of the Emperor of China's Gardens near Pekin, in a letter from F. Attiret, a French miffionary now employed by that Emperor to paint the apartments inthofe gardens, to his friend at Paris." Both thefe treatifes are printed in Dodfley's fugitive pieces, as is alfo "A Letter from a Swifs Officer to his friend at Rome;" which Mr Spence firft publifhed in the Mufeum. In 1758 he publihed "A Parallel, in the Man. ner of Plutarch, between a moft celebrated man of Flo. rence and one fearce ever heard of in England." This was alfo inferted in the fugitive pieces. The fame year he made a journey into Scotland, which he defrribed in an affectionate letter to Mr Shenftone, publifhed in Hall's Collection of Letters, 1.778 . In 1764 he was very well defcribed by Mr James Ridley, in his admirable Tales of the Genii, under the name of Phefoi Ecneps (his name read backwards), dervife of the groves. A letter from Mr Spence to that ingenious moralift, under the fame fignature, is preferved in the 3 d volume of "Letters of Eminent Perfons." In 1768 he publifhed "Remarks and Differtations on Virgil, with fome other claffical obfervations, by the late Mr Holdfworth." On the 2oth of Auguft the fame year he was unfortu. nately drowned in a canal in his garden at Byfleet in Surrey. He was found flat upon his face at the edge of the canal, where fle water was fo fhallow as not even to cover his head. The accident, it was fuppofed, for le was quite alone, was owing to a fit.

The duke of Newcaftle poffeffes fome manufcript volumes of a aecdotes collected by Mr Spence, from which Dr Johnfon was permitted to infert many extracts in his Lives of the Poets.

SPLNCER (Dr John), an eminent divine, was born in Kent in 1630 , and educated at Cambridge. He was chofenfellow of his college, and took a doctor's degree in 1663. In 5667 he was chofen mafter of Corpus Chrifti College, and preferred to the deanery of Ely in 1677 . He died on the 2cth of May 1695. His works are, 3. The Righteous Ruler; a fermon on Proverbs xxix. 2. preached June 28. T660. 2. A Difcourfe concernirg Prodigies, wherein the vanity of prefages by them is reprehended, and their true and proper ends afferted and
vindicated

\section*{\(S\) P E}

\section*{S. P E}
vindicated. To this excellent work was afterwards added, A Dicourfe concerning vulgar prophecies, wherein the vanity of receiving them as the certain indications of any future event is expofed; and fome marks of diftinction between true and pretended prophets are laid down. 3. A Latin Differtation eoncerning Urin and Thummin. . 4. His famous treatife De legibus Hebroorum ritualibus et earum rationibus. The intention of this book, as he informs us himfelf, was to vindicate the Deity from the imputation of acting from arbitrary and fantaftical motives. 'It has been highly and juftly efteemed both for the elegance of ftile and the uncommon erudition and found fenfe which it difplays. It has, however, (that part of it particularly which endeavours to deduce fonte of the Jewifh ccremonies from the practices of their heathen neighbours), alarmed many perfons, as if fuch a doctrine, if it could be proved, would derogate from the Divine wifdom, and undermine revelation. But this is fo far from being the cafe, that Dr Spencer's attempt, whether fucceifful or not, deferves the gratitude of Chriftians, becaufe it has' a tendency to throw light on an important and difficult fubject.

SPENSER (Edmund); the peet, was born in London in the year 1553, and defcended from an ancient family of the Spenfers in Northamptonhire. All we know concerning his education is, that he was admitted a fizer of Pembroke-hall in Cambridge, and matriculated in 1569 . At this time began his intimacy with Mr Gabriel Harvey, a man of genius and a poet. ln 1576, having completed his degrees in arts, he left the univerfity, as it is conjectured, for want of fubfiftence, and retired to the north of England. Here he had the misfortune to become enamoured of his Rofalind, who, after flattering his paffion for a time, at length preferred his happier rival. Spenfer continued in the country till the year 1578 , when at the perfuafion of his friend Mr Harvey he removed to London, where that gentleman introduced him to Mr Sidncy (afterwards Sir Philip Sidney). Concerning his firt introduction to Sir Philip, there is indeed a different ftory, which was firft told by the writer of his life, prefixed to his works in \(\$ 679\), and tranfcribed by Hughes, Cibber, and feveral others; which, neverthelefs, is certainly not trne. The purport of it is, that Spenfer, being unknown to this Mecænas of the age, went to Leicefter-houfe, and fent in the 9th canto of the firft book of the Fairy Queen ; that, on reading part of it, Sir Plilip ordered his ftew. ard to give the bearer 501. ; on reading a little farther 501. more ; then 2001 . bidding him to make hafte and pay the money, left he fould give the poet his whole eftate. The fory tells prettily enough; but it is very certain, that the Fairy Queen was begun long after his acquaintance with Sir Philip. By this univerfal patron of genius, however, he was prefented to queen Elizabeth, who honoured him with the place of poet-laureat. Abont this time he finifhed his Shepherd's Calendar, which was firft printed in 1579; and in the following year, being recommended by his patron to the earl of

Leicefter, he went to Ireland as fecretary to the lord Spenfer, Grey of Wilton, then appointed lord-lieutenant of \(\underbrace{S \text { ergula. }}\) that kingdom. Lord Grey was recalled in 1582 , and with him Spenfer returned to London, where he continued till after the death of Sir Philip Sidney in 1586 ; a lofs which he bewailed to the end of his life. The following year, our poet, having obtained a royal grant of - 3000 acres of forfeited lands in the county of Cork in Ireland, fet out for that kingdom, took poffeffion of his eftate, and fixed his refidence in the caftle of Kil. colman, which had belonged to the earl of Definond. In this retirement he refumed his great work of the Fairy Queen ; and continued in Ireland till, being vifited by his old friend Sir Walter Raleigh in 1589 , he came over with him to England, but returned to Ircland the year following, where he fell in love with a country girl, and married her. Soon after his marriage, he paid another vifit to his native country, where we alfo find him in 1596 . In the following year he returned once more to Kilcolman; but on the rebellion of Lord T'yrone, who ravaged the whole county of Cork, he was obliged to fly for fafety with his family to England, where, in the year 1599, he died in extreme poverty (A). He was buried in Weftminfter Abbey, according to his requeft, near Chaucer. A monument was erected to his memory by Ann countefs of Dorfet. We know but little of his character as a man ; as a poet, confidering the age in which he lived, he deferves our utmoft veneration. He wrote various pieces befides thofe above-mentioned His whole works, with his life by Hughes, were publifhed in fix volumes 12 mo , in 1715 and 1750.
SPERGULA, Spurrey, in botany: Agenus of plants belonging to the clafs of decandria, and the order of pentagynia; and in the natural fyftem arranged under the 22d order, caryophyllea. The calyx is pentaphyllous: the petals five, and undivided; the capfule oval, unilocu, lar, and containing five valves. There are five fpecies, the arvenfis, nodofa, pentandra, laricina, and faginoides ; all of which are Britifh : 1. The arvenfis, corn-fpurrey, has linear furrowed leaves, from eight to twenty in a whirl. The flowers are fmall, white, and terminal. It is frequent in corn-fieids. In Holland it is cultivated as food for cattle, and has the advantage of growing on the very pooreft foils; but does not afford a great deal of food. . Poultry are fond of the feeds; and the inhabitants of Finland and Norway make bread of them when their crops of corn fail. Horfes, fheep, goats, and fivine, eat it. Cows refufe it.
2. The nodofa, knotted fpurrey. Several ftalks arife from one root, fometimes reclining and fometimes erect, and from three to five inches high. The leaves are fmooth, of a fine green, narrow, pointed, and oppofite. The flowers are white, terminal, with yellow anthere.
3. Pentandra, frall fpurrey. The leaves are very narrow, and grow in whirls at the joints. The feeds are black with a white circle. It flowers in July.
4. Laricina, larch-leaved fpurrey. Several falks
(A) This is Camden's account, and it has been generally believed; but Mr Malone, the laft editor of Shakefpeare's works, by examining the patent roll, \(3_{3}\) Eliz. p. 3. has difovered, that in February 1790-FSpenfer obtained from Queen Elizabeth an annuity or penfion of \(L\). 50 during his Life; a fum equivalent to L. 200 at prefent.

\section*{S P E \\ [ 688] - S P E}
sperm, arife from ore root, from an inch to an inch and a half \(\underbrace{\text { Spermaceti }}\) high ; the leaves are linear, fubulate, and acuminated, fomewhat hairy on the edges, and their points turned to one fide of the ftalk. The petals are white and about the length of the calyx. Lightfoot found this fipecies on a hill in the ifle of Bute. Hc is dorbtful whether the fagina procumbens, var. \(\beta\) of Linnæeus, be not the fame plant with this. It flowers in July.
5. Sagizoidss, pearlwort fpurrey; has fmooth, linear, eppofite leaves: the peduncles are folitary and very long. Aiton fays it is a native of England, and flowers from June to Augutt.

SPERM, the feed whereof an animal is formed. See Physiology.
SPERMIACETI, a whitifh, unctuous, flaky fubftance, prepared from: oil, but chiefly from the brains of a fpecies of whale called ppyyfer macrocep balus.

The method of preparing fpermaceti is kept a fecret; but the procefs is faid to be this: The brains being taken out of the animal, are then, as fome fay, melted over a gentle fire, poured into moulds, and when cold melted again; and this procefs is continued till they are purified. Others fay, that after being preffed and drained they are more thoroughty purified by fleeping them in a ley of alkaline falt and quicklime. 'The brains are then wafhed, and cut into thin flakes or flices with wooden knives. One fifh is faid to afford fome tons of brains. Good fpermaceti is gloffy and femitranfparent, in fine white flakes; foft and unctuous to the touch, yet dry and friable ; in tafte, fomewhat like butter, and of a faint fmell like that of tallow. Some adulterate it with wax ; but the deceit is difcovered, either by the fmell of the wax or by the dulnefs of the colour. Some allfo fell a preparation of oil taken from the tail of the whale inftead of that from the brain; but this kind turns yellow as foon as expofed to the air. Indeed it is apt in general to grow yellowinh, and to contract a rancid filhy fmell if not carefully fecured from the air. The more perfectly it has been purified at firlt, the lefs furceptible it is of thefe alterations; and after it has been changed, it may be rendered white and fweet again by fteeping it afrefh in a ley of alkaline falt and quicklime. It melts in a fmall degree of heat, and congeals again as it cools.

Spermaceti is of ufe in medicine. Quincy fays it is a noble remedy in the afthma, \& c . though chiefly ufed in bruifes, inward hurts, and after delivery. For internal ufe, fit may be diffolved in aqueous liquors into the form of an emulfion, by trituration with almones, the yolk or white of an egg, and more elegrantly by mucilages; or made into a lohoch, by mixing two drams of it with a fuitable quantity of yolk of egg, then adding half an ounce of frefh drawn oil of almonds, and an ounce of balfamic fyrtip. Spermaceti is not capable of being difolved by cauftic alkalis, and of forming foaps, like other oily matters: but it is altogether foluble in oils, and unites by liquefastion with wax and refins; and in thefc forms is applied externally. But it is certain, its greazeft property, and that which makes it fo much in vogue in many places, is its foftening the Akin. Whence it comes to be ufed by the ladies in paftes, wathes, \&c.

Spermaceti candles are of modern manufacture : they are made fmooth, with a fine glofs, free from rings and fcars, fuperior to the finett wax-candles in colour and
luftre ; and, when genuine, leave no fpot or ftain on the Sperm fineft filk, cloth, or linen.

A method has been lately propofed by Mr Smith Gibbes of Magdalen collcge, Oxford, to convert animal mufcle into a fubltance much refembling fpermaceti. The procefs is remarkably fimple: Nothing more is Pbil. 2 neceffary than to take a dead carcafe and expofe it to a 1794. ftream of running water: it will in a fhort time be changed to a mafs of fatty matter. To remove the offenfive fmell, a quantity of nitrous acid may then be poured upon it, which uniting with the fetid matter, the fat is feparated in a pure ftate. This acid indeed turns it yellow, but it may bc rendered white and pure by the action of the oxygenated muriatic acid. Mr Gibbes brought about the lame change in a much fhorter time. He took three lean pieces of mutton and poured on them the three mineral acids, and he perceived that at the end of three days each was much altered ; that in the nitrous acid was much foftened, and on feparating the acid from it, he found it to be cxactly the fame with that which he had before got from the water; that in the muriatic acid was not in that time fo much altered ; the vitriolic acid had turned the other black.
SPERMACOCE, butTon-wood, in botany: A genus of plants belonging to the clafs of tetrandria, and order of monogynia; and in the natural fyftem arranged under the 47 th order, Atellatio. The corolla is monopetalous and funnel-fhaped, and there are two bidentate feeds. The fpecies are eight, tenuior, verticillata, hirta, articularis, Itricta, hifpida, procumbens; and fpinofa.
SPERMATIC, in anatomy, fomething belonging to the fperm or feed.

SPEUSIPPUS, an Athenian philofopher, the nephew and fucceflor,of Plato. Contrary to the practice of Plato, Speufippus required from liis pupils a ftated gratuity. He placed thatues of the graces in the fchool which Plato had built. On account of his infirm ftate of health, he was commonly carried to and from the academy in a vehicle. On his way thither he one day met Diogenes, and faluted hin ; the furly philofopher refufed to return the falute, and told him, that fuch a feeble wretch ought to be afhamed to live; to which Speufippus replied, that he lived not in his limbs, but in his mind. At length, being wholly incapacitated, by a paralytic ftroke, for the duties of the chair, he refigned it to Xenocrates. He is faid to have been of a violent temper, fond of pleafure, and exceedingly avaricious. Speufippus wrote many philofophical works, which are now loft, but which Ariftotle thought fufficiently valuable to purchafc at the expence of three talents. From the few fragments which remain of his philofoply, it appears that he adhered very ftrietly to the doctrine of his matter.

SPEY, a river of Scotland, rifing from a lake of the fame name in Badenoch, and, after a ferpentine courfe of 75 miles, paffes by Rothes caftle, and falls into the German fea at Garnoch near Elgin. Mr Pennant tells us, that the Spey is a dangerous neighbour to Cafle Gordon, overflowing frequently in a dreadful manner, as appears by its ravages far beyond its banks. The bed of the river is wide and full of gravel, and the channel very ghifting. - In 1745 the duke of Cumberland paffed this river at Belly church, near Caftle Gordon, when the channel was fo deep as to take an officer, from
whona
acelus whom Mr Pennant had the accóunt, and who was fix feet four inches high, up to the breaf. The banks are here very high and fteep; fo that had not the rebels been infatuated in fuch a manner as to neglect oppofition, the paffage munt have been attended with confitherable lofs. On this river there is a great falmonTiihery ; about 1700 barrels full are caught in the feafon, and the thore is rented for about x 2001 . per annum.

SPHACELUS, in furgery and medicine, an abfolute and perfect corruption or death of the parts.

SPHÆRANTHUS, in botany: A genus of plants belonging to the clafs of fyngenefia, and to the order of polygamia fegregata; and in the natural fyttem arranged under the 49 th order, Compofita. Each partial calyx contains eight florets; the florets are tubulated, the female being fcarcely diftinguifhable. The receptacle is fcaly; and there is no pappus. The fpecies are three, the indicus, africanus, and chinemfis.

SPHA GNUM, boc-moss, in botany; a genus of plants belonging to the clafs of cryptogamia and order of mu/ci. The anthiere are globofe; the mouth entire and clofed by an operculun? ; the calyptra is wanting. There are three fpecies, the paluttre, alpinum, and arboreum, i. The faluffre, common bog-mofs, grows on our bogs in wide patches, fo as frequently to cover a large portion of their furface. The ftalks are from two inches to two feet long, irregularly firrounded with numerous, conical,' pendant branches, and terminated with a rofaceous clufter of ereet fhert ones. It is gene. rally believed, that the roots and decayed ftalks of this mofs conftitute a principal part of that ufeful bituminous fubftance called feat, which is the chief fuel of the northern regions. - The Lapland matrons are well acquainted with this mofs. They dry and lay it in their cradle, to fupply the place of bed, bolter, and every covering ; and, being clanged night and morning, it keeps the infant remarkably clean, dry, and warm. It is fufficiently !oft of itfelf; but the tender mother, not fatisfied with this, frequently covers the mofs with the downy hairs of the rein-deer; and by that means makes a moft delicate neff for the young babe. 2. The alpinum, green bog-mofs. Its brancles are fubulate and erect; the anthere are oval. It grows in monntain bogs in Solith Britain. 3 The arboreum, creeping bormols, is branched; the anthere are numerous, feffile, hairy, and grow along the branches chiefly on one fide. It is found on the trunks of trees.
Os SPHENOIDES, the feventh bone of the cranium or fkull. See Anatomy, \({ }^{\circ}{ }^{1} 1\).

SPHERE, is a folid contained under one uniform round furface, every point of which is equally diftant from a certain point in the middle called its centre ; and is formed by the revolution of a femicircle about its diameter. See Gfometry.
Projection of the Sphere. See Projection.
Sphere, in aftronomy, that concave orb or expanfe which invefts our globe, and in which the heavenly bodies appear to be fixed, and at 'an equal diftance from the eye.

The better to determine the places of the heavenly bodies in the fphere, feveral circles are fuppofed to be defribed on the furface thereof, hence called the circles of the Sphere: of thefe fome are called great circles, as the equinoctial, ecliptic, meridian, \& cc. and others fmall

Vos. XVII. Part II.
circles, as the tropics, parallels, \&c. See Grography; and Astronomy, paffim.
Armillary Sphere. See Geography.
Sphere of Acivivity of a Body, is that determinate face or extent to which, and no farther, the effluvia continually emitted from that body reach; and where they operate according to their nature.

SPHERES, in optics, the fame with metalline mirrors, for telefcopes or other purpofes. See Mirror.
SPHEROID, in geometry, a folid approaching to the figure of a fphere. It is generated by the entire revolution of a femi-ellipfis about its axis. When the revolution is made round the largeft axis, the fpheroid is celled prolate; and when round the fhorteft, oblate. Tlis laft is the figure of the earth, and probably of all the planets.
SPHEX, Ichneumon Wasp, or Savage; a genus of infects belonging to the order of bymenoptere. The mouth is armed with entire jaws, but contains no tongue; the mandibles are horny, crooked, dentated; the lip horny, the apex membranaceous. The palpi or feelers are four. The antennæ have from to to 16 joints. The wings of both fexes are extended without folds, and laid horizontally on the back. The "ting is fharp, and concealed within the abdomen. There are 97 fpecies, of which two only are natives of Britain and Ireland, the viatica and cribraria. - I. The victica is black : the antennæ are fhort and thick : the three firft fegments of the abdomen red-brown: the prdicle is fhort: the length half an incli. 2. The cribraria is black, with yellow ringlets on the abdomen : the antennx are fhort, and turned backwards: the fore-leys are
broad, with an appendix like a Chield. broad, with an appendix like a fhield.
The manner of living is different in the various fpecies, and fo is the general form of the body and their haunts ; but thongh the method of life be nitterly different, yet the fame manners appear inmate and inherent in all. They agree in beiing the fierceft of all fies: they will attack infeets mucl larger than themfelves, and this whether they be defencelefs or armed, as they are provided with a fting. The ftrength in all this favage kind is great ; their jaws arc hard and fharp, and in their fting lies a poifon filddenly atal to the creatures with whom they engage. The favarge feizes hardily on the aninial he attacks, and gives a ftooke of amazing force; after which he falls down as if himfelf were killed, but it is to reft from his fati;gue, and enjoy his victory. He keeps a theady eye on the creature he has itruck till it dies, which happens in a few minutes, and then drags it to the neft to feed the young. The number of orher infects they deftroy is fcarce to be conceived; the mouth of their cave is like that of a giant in the days of yore, ftrewed with the remains of prey. The eyes, the filament that ferves as a brain, and a fmall part of the contents of the body, are all the favage eats, and will kill ; o' for a meal.

SPHINCTER, in anatomy, a term applied to a kind of circular mufcies, or mufcles in form of ringe, which ferve to clefe and draw up feveral orifices of the body, and prevent the excretion of the contents.

SPHINX (fab. hift.), a monfter which had the head and breafts of a woman, the body of a dog, the tail of a ferpent, the wings of a bird, the paws of a lion, and an human voice. It fprane from the union of Orthos 4 S
with

Sphére

Sphinx. with the Chimæra, or of Typhon with Echidna. The Sphinx had been fent into the neirhbourhood of Thebes by Juno, who wifhed to punifh the family of Cadmus, which the perfecuted with immortal hatred, and it laid this part of Bœotia under continual alarms, by propofing enigmas, and devouriny the inhabitants if unable to explain them. In the midtt of their conternation the 'thebans were told by the oracle, that the fphinx would deftroy herfelf as foon as one of the en. igmas the propofed was explained. In this enigma fhe
Zempriere's Bibliotbeca CbIfica. wifhed to know what animal walked on four legs in the morning, t wo at noon, and three in the evening. Upon this Creon king of Thebes promifed his crown and his fifter Jocalta in marriage to him who conld deliver his country from the monfter by a fucceffful explanation of the enioma. It was at laft happily explained by Edipus, who obferved, that man walked on his liands and feet when young, or in the morning of life, at the noon of life he walked erect, and in the evening of his days he fupported his infirmities upon a flick. (Vid. Oedipus). The fphinx no fooner heard this explanation than fhe dafhed her head againft a rock, and immediately expired. Some mythologitts wifh to unriddle the fabulous traditions about the Sphinx by the fuppofition that one of the daugliters of Cadmus, or Laius, infefted the country of 'Thebes by her continual depredations, becaufe the had been refufed a part of her father's poffeffions. The lion's paw expreffed, as they obferve, her cruelty, the body of the dog her lafcivioufnefs, her enigmas the fnares the laid for Atrangers and travellers, and her wings the difpatch the ufed in her expeditions.

Among the Egyptians the fphinx was the fymbol of religion, by reafon of the obfcurity of its myfteries; and on the fame account the Romans placed a fphinx in the pronaos or porch of their temples. Sphinxes were ufed by the Egyptians to fhow the begiming of the water's rifing in the Nile : with this view, as it had the head of a woman and body of a lion, it fisnified that the Nile began to fwell in the months of July and Augult, when the fun paffes through the figns of Lea and Virgo. There are feveral of thefe fill to be feen; one in particular, near the pyramids, much fpoken of by the ancients; being of a prodigious fize, and cut out of the rock ; the head and neck appear only at prefent, the reft of the body being hid in the fand. This, according to Thevenot, is 26 feet high, and 15 feet from the ear to the chin : but Pliny affures us, the head was no lefs than 102 feet in circumference, and 62 feet high from the belly, and that the body was 143 feet long, and was thought to be the fepulchre of king Amafis.
* Ansient

The learned Mr Bryant * obferves, that the fphinx Mytboloory, feems to have been originally a vaft rock of different

\section*{vol. iii.}
fo. 532.
\(\ddagger\) Vol. ii.
P.334. ftrata; which, from a fhapelefs mafs, the Egyptians fathioned into an object of beauty and veneration. The Egyptians ufed this figure in their building; from them the Greeks derived it, and afterwards improved it into an elegant ornament. It is alfo frequently ufed in modern architecture.

It is proper to obferve, that the fphinx of the Egyptians is faid in the Afratic Refearches \(\ddagger\) to have been found in India. Colonel Pearfe was told by Murari Pandit, a man of learning among the Hindoos, that the fphinx there called fingh is to appear at the end of the
world, and as foon as he is born will prey on an ele. phant: he is therefore figured feizing an elephant in his claws ; and the elephant is made fmall, to thow that the fangh, even a noment after his birth, will be very large in proportion to it. But in oppofition to this account given by Murari Pandit, the late Sir William Jones, the learned and illuntrious prefident of the Atiatic Society, was affured by feveral Brahmans, that the figure taken for a fphinx was a reprefentation of a lion feizing a young elephant. 'rhis point therefore requires farther inveitigation.

Sphinx, HAWK-Molh, in natural hifory; a genus of infects belonging to the order of lepidoptera. The antenne are fhaped fomewhat like a prifm, and are more nender at each end than at the middle. The tongue is generally thruft out : the two palpi are bemt back, and the winrs deflexed. There are about 165 fpecies already difcovered, of which 10 are found in Great Britain and Ireland.
1. The ocellata, eyed willow hawk-moth. There is no trunk; the wings are indented. Above, if wings dark and light-brown, marbled ; 2d, red, with a large yellow-black cye. Beneath, a large red triangle fron the bafe of the ift wings. The breadth one inch and an half. Caterpillar fmooth, green, with oblique white lines on the fides, and a pofterior horn. The eggs are green. It lives on willows. 2. Populi, poplar hawkmoth. The wings are fcalloped, bluifh grey, and waved with dark lines. On the ift winge a long white fpot, and the bafe of the 2 d red brown. Wings reverfed. Length one inch. A long fpiral trunk caterpillar green, fmooth, with oblique white fpots, and as pofterior horn. It lives on poplars and willows. 3. Tilic, lime hawk-moth. No trunk: the wings are fealloped : the antennæ are white on the upper fide, yellow on the under. Above, ift wings grey-brown, with two irregular large green fpots; 2d, wings orange. Beneath greenifh grey. Caterpillar green, fhagreened, with a pofterior horn. 4. Convolvuli, unicorn, or bindweed hawk-moth. The antennæ are long and thick: the trunk very long and fpiral. Above, body marked with black and red belts; wings entire, brown.grey, with black ais-zag tranfverfe lines. The breadth three inches. Caterpillar fmonth, green, with a pofterior horn. 5. Ligultri, privet hawls-moth. The antenne are long, thick, and brown. 'Irunk long, fpiral. Ift wings two inches long, narrow, entire, brown; 2d, fhort, red, with black bars. The abdomen is red, with black rings Caterpillar fmooth, yellow-greers, with a pofterior horn. 6. Atropos, jeffamine hawk-moth. The wings are en tire : the trunk long, fpiral. Above, if wings brown, clouded with grey and yellow, and a yellowihh foot in the centre; 2d, yellow, with two waved tranfverfe ftripes. The abdomen is yellow, with feven black-brown belts. 'I'he thorax marked like a Death's-head. Length two inches. Caterpillar very large, yellow, with fix green and orange oblique belts, and a polterior horn. 7.Elpenor, elephant moth. The wings are angular, entire. Above, Ift wings ftriped tranfverfely with red and green; 2d, black at the bafe, and red outwards. The body red and green. Caterpillar fmooth, brown and yellow, with a pofterior horn, and a fnout like a hog. It lives on vines, convolvulus, \&c. 8. Stellatarum, large bee moth. The antennz are thick towards the ends,

\section*{S P I}
hinx, brown. The trunk is fpiral: the wings are fhort and entire : the body is thick, brown, and hairy. Firft wings are brown, waved; 2 d , red brown. It refembles a large bee. Caterpillar fmooth, with a pofterior blue horn, tipt with red. It lives on gallium. 9. Tipuliformis, fmall bee moth. The thorax is yellow beneath: the wings are fhort, with black veins. The abdomen black, نearded, yellow at the extremity. Caterpillar on the lonicera. ro. Filipendule, burnet moth. 'The antennx, legs, and body, are black. Second wings red, with a greenilh border. Firft wings bluifh green, with fix red fpots, in pairs. Length eight lines. Caterpillar yellow, with black fpots. It lives on grafs.

The name \(\int p\) phinx is given to this genus on account of the fingular attitudes of their caterpillars, who apply the hinder part of their body to a branch of a tree, holding the reft of it erect, like the fabulous fphinx. Mof of them fin their cod under ground, making them up with fmall parcels of earth and grains of corn intervoven with threads. The fphinges fly either early in the morning, or atter funfet in the evening. They fly heavily and Aluggifhly, often emitting a kind of sound.
spigelta, Worm-grass, in botany: A genus of plants belonging to the clafs of pentandria, and order of monogynia; and in the natural fyttem arranged under the \(47^{\text {th }}\) order, Stellata. The corolla is funnel-fhaped; the capfule is didymous, bilocular, and polyfpermous. There are two fpecies, the anthelmia and mari1andica.

The anthelmia has a herbaceous ftem, and its higheit teaves are fourfold.
"'The effects of this medicine (fays Dr Browne) are thefe: It firtt procures fleep, almoft as certainly, and in an equal degree, with opiun; the eyes feem to be diftended, and fpa:kle as it were before the eruption of the fmall-pox or meafles, which may be eafily obferved after the ficep is over ; the pulfe grows regular and rifes, the fever cools, the fymptoms appear more favourable, and the worms are generally difeharged by the ufe of the fubfequent purgatives (if not before) in great quantities, often above 100 at a time; but when a few only come away, which is feldon, and thefe alive, the fame dofes are again sepeated, which feldom or never fail. I never faw this medicine fail when there was the leaft probability of Euccefs; nay, often prove fuceefsful when there was not the leaft reafon to expect it. I have been, however, cautious in ordering it for children ; for though I never knew it at all hurtful, its effect upon the eyes has of ten deterred me from ordering it to children, whofe fibres are weak and relaxed, and in whom the fevers from this fource are feldom fo vehement as to hinder the adminiftration of other medicines, likely as effectual in other cafes of this nature. This plant is generally had in low dry. lands, after they have been turned up fome months, and after great rains ; its talte is herbaceous, and fomewhat clammy, its growth is foft and fudden, its ftalk holiow, fmooth, and roundifh. Its herbaceous tafte and fudden growth would alone make me think \(\cdot\) it capable of little or no action, had not hundreds of careful oblervations fatisfied me to the contrary."

The marilandica, perennial worm-grafs, or Indian pink. The beft defeription of this plant which we have Seen is given by Dr Woodville, in his Medical Botany;
a work which exhibits a complete fyitematic view of Spigelim, the medicinal effects of vegetables. Its ftem is four- sipice. cornered; all the leaves oppofite.

Dr Garden, in a letter to the late Dr Hope, proferfor of botany in the univerfity of Edinburgh, dated 1763, gives the following account of the virtues of this plant. "About 40 years ago, the anthelmintic virtues of the root of this plant were difcovered by the Indians; fince which time it has been much ufed here by phyficians, practitioners, and planters; yet its true dofe is not generally afcertained. I have given it in hundreds of cales, and have been very attentive to its effects. I never found it do much fervice, except when it proved gently purgative. Its purgative quality naturally led me to give it in febrile difeafes, which feemed to arife from vifcidity in the prima via; and, in thefe cafes, it fucceeded to admiration, even when the fiek did not void worms.
"I have of late, previous to the ufe of the Indian pink, given a vomit, when the circumftances of the cafe permitted it ; and I have found this method anfwer fo well, that I think a vomit fhould never be omitted. I have known hall a dram of this root purge as brifkly as the fame quantity of rhubarb; at other times I have known it, thougli given in large quantities, produce no effect upon the belly : in fuch cafes, it becomes neceffary to add a grain or two of fweet mercury, or fome grains of rhubarb; but it is to be obferved, that the lame happy effects did not follow its ufe in this wray, as when it was purgative without addition. The addition, however, of the purgative renders its ufe fafe, and removes all danger of convulfions of the eyes, although neither ol. rute, fabine, or any other nervous fubftance, is given along with it. It is, in general, fafer to give it in large dofes than in finall; for, from the latter, more frequently the giddinefs, dimnefs of the fight, and convultions, \&e. follow; whereas, from large dofes, I have not known any other effect than its proving emetic or violently cathartic. 'To a child of two years of age, who had been taking 10 grains of the root twice a-day, without having any other effect than making her dull and giddy, I prefcribed 22 grains morning and evening, which purged her brikkly, and brought away five large worms. After fome months an increafed dofe had the fame good effects. I prefer the root to the other parts of the plant; of which, when properly dried, I gave from 12 to 60 or 70 grains in fubitance. In infufion, it may be given to the quantity of two, three, or four drams, twice a.day. I have found that, by keeping, the plant lofes its virtue in part ; for 40 grains of the root which has not been gathered above two months, will operate as ftrongly as 60 which lias been kept for 15 months."

In Dr Garden's fubfequent letters, addreffed to \(\mathrm{Dr}_{r}\) Hope, in the years 1764 and 1760 , the efficacy of this root in worm cafes is further confirmed; and he obferves, that the root keeps better than he at firt thought (ha: ving lately ufed it feveral years old with great fuccefs). In what he calls continued or remitting low worm fevers, he found its efficacy promoted by the addition of rad. Cepentar virg.

SPICE, any kind of aromatic drug that has hot and pungent qualities: fuch are pepper, nutmeg, ginger, cinnamon, cloves, \&c.

4 S 2
SPICE

Spice - Spick-Y/ands, in the Eaft Indies. See Banda, Mo. aucca- Ifands, and Ceylon.

SPIDER, in zoology. See Aranea.
spiderwort, in botany. See Phalangium. SPIGNEL, in botany. See Athamanta.
SPIKE, or Oil of \(S_{\text {FIKE, }}\) a name given to an effential oil diftilled from lavender, and much ufed by the varnifhmakers and the painters in enamel.

SPIKENARD, in botany. See Nardus.
SPILANTHUS, in botany; a geताus of plants belonging to the clafs of fyngenefia, and to the order of polygamia aqualis. The common calỳx is erect; the leaflets numerous, fub-equal, and oblong, the two exterior being longer than the reft. The compound corolla is uniform and tubular ; the florets are hermaphrodite and equal; the proper corolla is funnel-fhaped. 'The filaments are five in number, and fhort. The anthere cylindrical and tubular. 'The feeds are vertical, oblong, flat, and covered with chaff. The receptacle is paleaceous and conical. There are feven fpecies, the urens, preudo-acmella, acmella, falivaria, atriplicifolia, infipida, and oleracea.
SPINA crrvina, the fame as the rhamnus catharticus. See Rhamnus.
\(S_{\text {PINA }}\) Vento/a, in furgery, that fpecies of corruption of the bones whicll takes its rife in the internal parts, and by degrees enlarges the bone, and raifes it into a tumor. See Surgery.
SPINACIA, spinage, in botany: A genus of plants belonging to the clafs of diacia, and to the order of pentardria; and in the natural fyltem arranged under the 12th order, Holoracees. The male calyx is quinquepartite; there is no corolla: the female calyx is quadrifd ; no corolla; there are four fyles, and one feed within the indurated calyx. There are only two fpecies, the oleracea and fera. I. The oleracta, common fpinage. has feffile fruits and fagittated leaves. It has been cultivated in Britain fince 1568, but it is not known from what country it was originally brought. When intended for winter ufe, it thould be fown on an open fpot of ground in the latter end of July; obferving to do it if poffible when the weather is rainy. When the young plants are come up, the weeds mult be deftroyed, and the plants le:t at about five inches afunder. The ground being kept clear of weede, the fpinage will be fit for ufe in October. The way of gathering it to advantage is only to take off the longett leaves, leaving thoie in the centre to grow bigger; and at this rate a bed of fpinage will furnifh the table for a whole winter, till the fpinage fown iô pring is become fit for ufe, which is common in April. 2. The fera, wild fpinage, produces its fruit on footftalks.
SPIN GE, or Spinach. See Spinacia.
SPINE, in botany, thorns, rigid prickles: a fpecies of armu, growing on various parts of certain plants for their-delence; bind ramorum arcant pecora. On the branches we find examples in the pyrus, prunus, citrus, hippophaes, gmelina, rhamnus, lycium. \&c.; on the leaves in the aloe, agave, yucca, ilex, hippomane, theophrafta, carlina, \&c. ; on the calyx, in the carduus, cnicus, centauria, moluccella, galeopfis, \&c.; on the fruit, in the trapa, tribulus, inurex, fpinacia, agremosia, datura, \&c.
SPINAL marraw. See Anatomy, PartV. \(\mathrm{n}^{\circ}\) izz.

SPINALIS, in anatomy, the name of feveral mufcles, \&c. of the finine.
SPINDLE-tree, in botany. See Euonymus. Spint
Spine, spina dorsi. Sce Anatomy, \(\mathrm{n}^{\circ} 30\). Spine, in botany. See Spinke.
SPINELLO, a Tufcan painter, of great repute in his time. He painted a picture of the fallen angels, in which he drew fo horrid a picture of Lucifer, that it frightened him fo much as to affect his fenfes ever after, He flourihhed about the year 1380 .

SPINET, or Spinnet, a mufical inftrument ranked in the fecond or third place among harmonious inftruments. It confifts of a cheft or belly made of the moft porous and refinous wood to be found, and a table of fir glued on fips of wood called /ummers, which bear on the fides. On the table is raifed two little prominences or bridges, wherein are placed fo many pins as there are chords or ftrings to the infrument. It is played on by two ranges of continued keys, the former range being the order of the diatonic fcale, and that behind the order of the artificial notes or femitones. The keys are fo many. flat pieces of wood, which, touched and preffed down at the end, make the other raife a jack which ftrike and found the ftrings by means of the end of a crow's quill, wherewith it is armed. The 30 firt ftrings are of brafs, the other more delicate ones of ftecl or iron-wire ; they are all ftretched over the two bridges already inentioned. The figure of the fpinet is a long fquare or parallelogram; fome call it an burp couctied, and the harp an inver ted jpinet. See the article Harp.
This inftrument is generally tuned by the ear, which method of the practical muficians is founded on a fuppofition that the ear is a pertect judze of an octave and a fith. The general rule is to beyin at a certain note, as \(C\), taken towards the middle of the inftrument, and tuning all the octaves up and down, and alfo the fifthis, reckoning feven femitones to each fitth, by which means the whole is tuned. Sometimes to the common or fundamental play of the fpinet is added another fimilar one in unilon, and a third in octave to the trit, to make the harmony the fulle1; they are either played fepa:ately or together by means of a flop: thefe are called amabble or triple fipinets; fometimes a play of violins is added, by means of a bow, or a few whicels parallel to the keys, which prefs the ftrings and make the tound laft as long as the mufician pleates, and heighten an:l foften them inore or lefs, as they are more or lefs prefied. The larplichord is a kind of fpinet, only with anocher difpolition of the keys (fee the article Harpsichord). The inftrument takes its name from the fmall quill ends which touch the ftrings, refembling \(\int\) pine or thorns.
SPINIFEX, in botany; a genus of plants belonging to the glais of polygamiu and order of moracin. The hermaphrodite flowers have a calyx with bivalved bifllorous glumes, the valvelets being parallel to the rachis; the corolla is bivalved and awnlefs; there are three ita; mina and two fyles. In the male flowers the calyx is common with the hermaphrodite ; the corolla and ftar mina are finilar. There is only one fpecies, the fquarrofus.

SPINNING, in commerce, the act or art of reducing filk, flax, hemp, wool, hair, or other matters, into thread. Spinning is eitber performed on the wheel, or with a diftaff and fpindle, or with other machines
proper

tugal, by profeffion a merchant. Afier being taught

\author{
Sjinnza.
} Latin by a phyfician, he applied himielt for many years to the ftudy of theology, and ofterwards devoted himfelf entirely to philofophy. He beran very carly to be diffatisfied with the Jewifh religion; and as his temper was open, he did not conceal his doubts trom the fynago: 11 l . The Jews, it is faid, offered to tolerate his infidelity, and evea pronifed him a pention of a thoufand dollars per annum, if he would remain in their fociety, and continne outwardly to practife their ceremonics. But if this offer was really made, he rejected it, perhaps from his averfion to hypocrify, or rather becaufe he could not endure the reftraint which it would have impofed. He alfo refured the legacy of a very confiderable fortune, to the prejudice of the natural heirs; and he learned the art of polining glafs for fpectacles, that he might fubfift independently of every one.

He would probably have continued in the fyna zorue for fome time longer, if it had not been for an accident. As he was returning home one evening from the theatre, he was flabbed by a Jew : the wound was flight ; but the attempt naturally led Spinoza to couclude that the Jews had formed the delign of affeffinating him. After leaving the fyna rozue, he became a Chritian, and frequented the churches of the Lutherans and Calvinits. He now devoted himfelf more than ever to his favourite philofophical fpeculations; and finding himfelf frequently interrupted by the vifits of his friends, he teft Amifterdam, and fettled at the Hague, where he often continued for three months tozether without ever ftirring from his lod ring. Daring his refidence in that city, his holtefs, who was a Latheran, afked him one day if the could be faved while the continued in her religion? " Yes (replied Spinoza), ?rovided you join to your religion a peaceable and virtuous lite" From this anfwer it has been concluded that he was a Chritian in appearance only, while in reality he recgarded all religions as indiffrent. But this conclution would be too fevere, even if the woman had been a Nahometan. His Trait tus Thrologico-politicus, which was publithed abumt that time, is a better proof of his inlincerity then a thoufand fuch conclurions; tor this book contains all thofe do inines in embryo which were afterwa:ds nnfotded in his Orert Pefflouma, and which are general.y confidered as a fyttem ot atheiin.
His fane, which had now fpread far and wide, obliged him fometines to interrupt his philolophical reveries. Iearned inea vifited him from all oualters While the prince of Condé commanied the Fiench army in Utiecht, he intreated Spinoza t, vifit him; and though he was abfent when the philofopher arrived, he return ed immedrately, and fipent a confiderable time with him in converfation. 'the elector Palatine offered to make Spinoza proteffor of philofophy at Heidelberg; which, however, he declined.

He died of a conlumption at the Hague on the 2 :ft February 1677, at the age of 45 . His. life was a perpetual contradiction to his opinions. He was temperate, liberal, and remark thly difinterefted; he was foo ciable, aff.able, and friendly. His converfation was agreeable and infructive, and never deviated from the ftricteet propriety.

The only edition of the works of Spinoza that we have feen is in two volumes fmall 4 to ; the pormer of

\section*{5 P}
spincza.
which was printed at Hamburg in the year 1670, and解 after his death. In the Trallatus Theologico-politicus, already mentioned, he treats of propbecy and proploets; and of the coll of the Helrews, whom he affirms to have been diftinguithed from other nations only by the adinirable form of their government, and the fitnefs of their laws for long prcferving their political ftate. He is likewife of opinion, or at leaft pretends to be fo, that God may, in what we call a fupernatural way, have given political infitutes to other nations as well as to the Hebrews, who were, he fays, at no time a peculiar people to the Supreme Lord of heaven and earch; for, according to him, all hiftory, facred and profane, teftifies that evcry nation was bleffed with the light of prophecy. 'That light indeed, if his notions of it be juft, was of very little value. He labours to prove, that the prophets were diftinguified from other men only by their piety and virtue; that their revclations depended wholly on their imaginations and the difpofitions of their minds; that they were often grofsly ignorant and highly prejudiced; that the fpeculative opinions of one prophet are feldom in unifon with thofe of another ; and that their writings are valuable to us only for the excellent rules which he acknowledges they contain refpecting the practice of piety and virtue. He then proceeds to treat of the divine law and of miracles; and endeavours to prove that no miracle, in the proper fenfe of the word, can lave been at any time performed; becaufe every thing happens by a neceffity of nature, the refult of the divine decrees, which are from all eternity neceffary themfelves. He acknowledges, that in the Scriptures, which he profeffes to admit as true hiftory, miracles are often mentioned; but he fays that they were only fingular events which the facred hiftorians imagined to be miraculous: and he then gives fome very extraordinary rules for interpreting the books of the Old and New 'Teftaments where they treat of miracles, or appear to foretel future events. See our articles Miracle and Prophecy.

Having thus divetted the Scriptures of every thing characteriftic of a revelation from hcaven, he next calls in queftion their authenticity. He afirms, in contradiction to the clearcf internal evidence, that the Pentateuch and all the other hiftorical books muft have been written by one man; and that man, he thinks, could not have Hourithed at a pcriod earlier than that of Ezra. The grounds of this opinion are unworthy of the talents of Spinoza; for that he had talents is incontro. vertible. His principal objection to the authenticity of the Pentateuch is, that Mofes is made to fpeak of himfelf in the third perfon, and to talk of the Canaanites being then in the land; and becaufe he finds in his writings, as well as in the books of Jofhua, Judges, Kuth, Samuel, \&c. places defigned by names which he fuppofes they had not in the early ages of which thefe books contain the hiftory, he concludes that thefe writings muft be one compilation from ancient records made at a very late period; more efpecially as the author often fpeaks of things of great antiquity remaining to this day. The books of Efther, Ezra, Nehemiah, and Chronicles, muft have been compiled, he thinks, under the Maccabees; and he feems to confider as of equal value with them the fory of 'Iobit, and the other
two apocryphal treatifes intitled the Wifdom of Solo. Spin món and Ecclefiaticus.
'I'hcfe fenfelefs cavils, worthy only of one of thofe modern freethinkers whofc learning, in the opinion of Bifhop Warburton, is not fufficient to carty them even to the confines of rational doubt, we have fufficiently obviated in another place (fee SCR1PTURE, \(n^{\circ} 8-31\) ) Spinoza urges them azaint the other books of the Old 'Teftament. The prophecies of Ifaiah, Jeremiah, Ezekiel, Daniel, Hofea, and Jonah, are, as we have them, only fragments, he fays, of the writings of thofe men compiled by the Pharilees under the fecond temple from ancient and voluminous records.

In the midft of this dogmatical fcepticifm, if we may ufe fuch a phrafc, he bears fuch a teftimony to the lait chapters of the book of Daniel, as we fhould not have looked for in the writings either of a Jew or of a Deift. After detailing the various hypothefcs which in his time were held refpecting the author and the intention of the book of \(\mathcal{F}\) ob; in which, he fays, Momus is called SAtan, he proceeds in thefe words: "Tranfeo ad Danielis librum; hic fine dubio ex cap. 8. ipfius Danielis fcripta continet. Undenam autem priora feptem capita defcripta fuerint, nefcio*;" thus admitting the famous prophecy of the feventy weeks. The canon of the Old 'l'eftament, he fays, was finally fettled by rabbins of the Pharifaical fect, who wifhed to exclude from it the books of Proverbs, Ecclefwhes, and Erekiel, as they had actually excluded others of equal value ; but the three books in queftion were inferted by the influ. ence of two of the rabbis of greater wifdom and integrity than the reft.

That fo paradoxical a writer, who had been originally a Jcw, and was now almoft a Deif, fhould have treated the New Teftament with as little ceremony as the Old, will not furprife the intelligent reader. He begins his remarks, however, with affirming, that no man can perufe the Chritian Scriptures, and not acknowledge the apoftles to have been prophets; but he thinks that their mode of prophefying was altogether different from that which prevailed under the IIofaic difpenfation; and that the gift, whatever it was, forfook them the inftant that they left off preaching, as their writings have to him every appearance of human compofitions. This diftinction between Chriftian and Jewith prophecy is the more wonderful, that he founds it principally on the diffimilarity of fyle vifible in the writings of the Old and New Teflaments; though, in his fecond chapter, which treats of the works of the Jewifh prophets, he fays exprefsly, "Stylus deinde prophetix pro eloquentia cujufque prophetæ variabat, prophetix enim Ezekielis et Amofis non funt, ut ille Efaix, Nachumi eleganti, fed rudiore fylo feripta." That the Hebrew fcholar may be convinced of the truth of this remark, he recommends to him to ftudy diligently the writings of thefe prophets, and to confider the occafions on which their prophecics were uttered: "Qux fi omnia recte perpendentur (fays he) facile oftendant, Deum nullum habere ftylum peculiarem dicendi, fed tantum pro eruditione, et capacitate prophetæ eatenus effe elegrantem, compendiofum, fevcrum, rudem, prolixum, et obfcurum." Another objection brought by Spinoza agairit the prophecies of the \(\mathrm{N}_{\mathrm{cw}}\) Teftament arifes from the authors of them having been
at all times matters of themfelves. This, fays he, was peculiarly the cafe of St Paul, who often confirms his doctrine by reafoning, which the Jewifh prophets never condefcenced to do, as it would have fubmitted their ' Jormas to the examination of private judgment. Yet, with fingular inconfiftency, he affirms, that the Jewifh prophets could not know that the impreffions made on their imaginations proceeded from God, but by a fign given them, which by their own reafon or judgment they knew would never be vouchfafed to an impious or a wicked man.

After thefe very free remarks on the Scriptures of the Old and New Teftaments, he naturally enough expreffes a fufpicion, that by thofe who confider the Bible as the epillle of God fent from heaven to men, he will be thought to have finned againft the Holy Ghoft by vilifying his dictates. This leads him to inquire in what fenfe the Scriptures are the word of God; and he gravely determines them to be fo only as they actually contribute to make men more virtuous and holy. It is not enough that they are calculated to improve virtue and holinefs: for fhould the words of the languages in which they are writtell acquire in procefs of time a fignifieation different from what they had originally; fhould mankind lofe all knowledge of thefe languages; or even fhould they agree to neglect the books, whether from ignorance or from wilfulnefs - thofe books would ceafe to be the word of God, and become nothing better than walte paper and ink; jult as the two tables, which Mofes broke on obferving the idolatry of his eountrymen, were not the covenant between Jehoval and the Ifraelitcs, but merely two pieces of ftone! The Seriptures, however, are the word of God, beeaufe they reach the true religion of which God is the author ; and they have taught it in fuch a manner, he fays, that it can never be loft ar corrupted whatever become of the books of the Old and New' Teftaments, or of the languages in which they are written. The whole of religion, as the Scriptures themfelves teftify, conlifts in the love of God above all things, and of our neighbours as ourfelves: whence it follows, that we mult believe that God exits, and watcheth over all things by his providence; that he is omnipotent, and has decreed the pious to be ultimately happy, and the impious miferable; and that our final falvation depends folely on His grace or favour. Thefe truths, with their neceffary conferquences, are the word of God: they are clearly taught in the Scriptures, and can never be corrupted; but every thing elfe in thefe volumes is vain, he fays, and of no greater importance to us than facts related in any other ancient and authentic hiftory.

Such are the opinions which were entertained of revelation by a man whom a critie, writing in a Chriftian country, and profeffing to be a zealous Chriftian himfelf, has lately pronounced to have been a chofen veffel. For what purpofe he was chofen it is not eafy to conceive. His religion, as it appears in the Traciatus, is the worft kind of Deifm; and his politics arc fuch as our monthly critics are not wont to teach, and fuch as we truft fhall never be ferioufly taught by any Britifh fubject. By the law of nature, he fays, every man before the formation of civil government has an unquef. tionable right to whatever appears eligible either to his reafon or to his appetites; and may get poffeffion of it by intreety, by violence, by fraud, or by any other means
attended with lefs trouble to himfelf (five vi, five dolo, Spinoza, five precibus, five quocunque demum modo facilius poterit); and may treat as an enemy every peifon who fhall attempt toobitruct his purpofe. But when men agree to devolve this right upon others, and to conftitute a political ftate, which both reafon and appetite mu't perfuade them to do, then are they in duty bound to obey every mandate of the government, however abfurd it may be (omnia mandata tamet \(f_{6} a b / u r d i(\sqrt{i m a})\), as long as that government can enforee its edicts, and no longer ; for, according to hiss, light and power are fo infeparably united, that when a government lofes its power, it has no longer the fmalleft elaim to obedience. This doctrine, he fays, is moit obvioufly juft when taught of democratical governments; but it is in fact equally true of monarchies and ariftocracies: "Nam quilquis fummam habet poteftatem, five unus fit, five pauei, five denique omnes, certum eit ei fummum jus quicquid velis imperandi, competere : et præterea quifquis poteftatem fe defendendi, five fponte, five vi coacius, in alium tranf. tulit, eum fuo jure naturali plane ceffife, et confequen* ter eidem ad omnia abfolute parere decreviffe quod omnia præitare tenetur, quamdiu rex, five nobiles, five populus fummam, quam acceperunt, poteftatem, quæ juris transferendi fundamentum fuit, confervant \(;\) nec his plura addere opus eft*." We heartily agree with him, "rirac. that to this precious conclufion it is needlefs to add a cap. xvis fingle word.

Taking our leave thercfore of his Trafatus Theolo-gico-politicus, we fhall now give our readers a fhort account of his-Opera Pofthuma. Thefe confift of, I. Ethica, more geometrico demonfirata; 2. Politica; 3. De Emendatione Intellectus; 4. Epistole, et ad eas Responsiones; 5. Compendium Grammatices Lingue Hebrefe.

The Etrica are divided into five parts, which treat in order, de Deo; de natura et orijine Mentis; de origine et natura AFFECTUUM; de SERVITUTE bumana, fouz de affectuum viribus; de potentia intellectus, feu de libertate bumana. As the author profeffes to tread in the footiteps of the geometers, and to deduce all his conchufions by rigid demonftration from a few felf.evident truths, he introduces his work, after the manner of Euclid, with a collection of defnitions and axioms. Thefe are couched in terms generally ambiguous; and therefore the reader will do well to confider attentively in what fenfe, if in any, they can be admitsed; for it will not be found eafy to grant his premifes, and at the fame time refufe his conclufions. His definition of fubftance, for inftance, is fo expreffed as to admit of two fenfes; in one of which it is jult, whiff in the other it is the parent of the molt impious. abfurdity. We fhall give it in his own words: "Per fubftantiam intelligo id, quod in fe eft, et per fe concipitur: hoc eft id, cujus conceptus non indiget conceptu alterius rei, a quo formari debeat." If by this be meant, that a fubflance is that which we can conceive by itfelf without attending to any thing elfe, or thinking of its formation, the definition, we believe, will be admitted by every reflecting mind as fufficiently diftinguifhing the thing defined from an attribute, which, he fays, is that which we perceive of a fubftance, and which we certainly cannot conceive as exitting by itfelf. Thus the writer of this article can fhut his eyes and contemplate in idea the fmall 4 to volume now be-

\section*{S P I}

Spinoza. fore him, without attending to any thing elfe, or thinking of its paradoxical anthor, or even of the Great Being who created the matter both of him and of it; but he cannot for an inftant contemplate the yellow colour of its vellum boards without thinking of triple extenfion, or, in other words, of body. The book therefore is a fubfance, becaufe conceivable by itfelf; the colour is an attribute or quality, becaufe it cannot be conceived by itfelf, but neceffarily leads to the conception of fomething elfe. But if Spinoza's meaning be, that nothing is a fubftance but what is conceived as exifting from eternity, independent of every thing as a caule, his definition cannot be admitted: for every man conceives that which in himfelf thinks, and wills, and is confcious, as a fubftance; at the fame time that he has the bett evidence poffible that he exifted not as a confcious, thinking, and active being, from eternity.

His tourth axiom is thus expreffed: "Effectus cog. nitio a cognitione caufæ dependet, et eandem involvit;" and his fifth, "Quæ nihil commune cum fe invicem habent, etiam per fe invicem intelligi non poffuat, five conctptus unius alterius conceptum non involvit." The former of thefe propufitions, fo far from being felf-evident, is not even true; and the latter is capable of two fenfes very different from each other. ' 'That every effect proceeds from a caufe, is indeed an axiom; but furely we may know the effect accurately, though we be ignorant of the particular caufe from which it proceeds (fee Philosoriy, \(n^{\circ} 3^{6}\); and Physics, \(n^{\circ} 91\), \&c.); nor does the knowledge of the one by any means involve the knowledge of the other. If different things have nothing in common, it is indeed true that the knowledge of one of them will not give us an adequate conception of the other; but it will in many cafes compel us to believe, that the other exifs or has exifted. A parcel of gunpowder lying at reft has nothing in common with the velocity of a cannon-ball; yet when we know that a ball has been driven with velocity from a cannon, we infer with certainty that there has been a parcel of powder at reft in the chamber of that cannon.

It is upon fuch ambignous definitions and axioms as thefe that Spinoza has raifed his pretended demomfrations, that one fubftance cannot produce another ; that every fubftance mult neceffarily be infinite; that no fubftance exifts or can be conceived befides God; and that extended fubftance or body is one of the infinite ottributes of God. We fhall not walte onr ow time or the reader's with a formal confutation of thefe impious abfurdities. We truit they are fufficiently confinted in other articles of this work (fee Metaphysics, Part III. Providence, and Theology, Part T.); and whoever wifhes for a more particular examination of the author's principles, may find it in Dr Clarke's Demonftration of the Being and Attributes of God. The truth, however, is, that no man will need the affiftance of that eminent metaphyfician to difcover the fallacy of the' reafoning by which they are attempted to be proved, if he affix any one precife meaning to the definitions and axioms, and adhere to that meaning fteadily thro' the whole procels of the pretended demonftrations.

By way of apology for this jargon, it has been lately faid, that "Spinoza takes the word fubflance in its
moft fimple and perfect fenfe; which is neceffary, as he writes mathematically, and propofes a fimple idea as the foundation of his theory. What is the proper fignification of a fubftance? Is it not that which ftands alone Dialogues cation of a fubftance? Is it not that which ftands alone, ooncerning
which has the caufe of its exitence within itfelf? I God. wifh that this fimple meaning of the word could be univerfally admitted in philofophy. Strictly fpeaking, no worldly thing is a fubftance; fince all mitually depend on each other, and finally on God, who, in this exalted fenfe, is the only fubftance. 'The word modification founds harfh and improper, and therefore it cannot be expected to gain a place in philofophy; but if the fchool of Leibnitz may term matter the appearance of fubflances, why may not Spinoza be allowed a bolder term? Worldly fubftances are kept in union by divine power, as it was by divine power that they had exiftence. They reprefent alfo, if you pleafe, modified appearances of divine power; each according to the ftation, the time, and the organs, in and with which it appears. The phrafé ufed by Spinoza is concife, and it gives an unity and fimplicity to his whole fyltem, however ftrange it may found in our ears."

From this account of Spinozifm, one who had never looked into the works of the author would be led to fuppofe that his fyifem is the fame with that of Berke. ley; which, denying the exiftence of material fubftance, attributes all our perceptions of what we call the qualities of body to the immediate agency of the Deity on our minds (fee Metaphysics, Part II. Chap. 3.) But Spirnoza's doctrine is very different. According to him, budies are either attributes or affections of God; and as he fays there is but one extended fubitance, he affirms that fubftance to be indivilible, and employs a long fcholium \(\dagger\) to prove that thofe are miftaken who fup- + See his pofe it finite and not effential to the Deity. That we do Prop. xvo not mifreprefent his fentiments, the learned reader will \(\$ \mathrm{sc}\). be convinced by the two following definitions, with which he introduces that part of his ethics which treats of the nature and origin of mind. 1. "Per corpus intellizo modum, qui Dei effentiam, quatenus, ut res extenfa confideratur, certo et determinato modo exprimit." 2. "Ad effentian alicujus rei id pertinere dico, quo dato res neceffario ponitur, et quo fublato res neceffario tollitur ; vel id, fine quo res, et vice verfa quod fine re nec effe nec concipi poteft." In couformity with thefe definitions, he atrempts to prove that God prop. ii. is an cxtended as well as a thinking fubttance; that as vii. xi. a thinking fubstance he is the caule of the idea of a Part 2. circle, and as an extended fubftance of the circle itfelf; and that the minds of men are not fubftances, but certain modifications of the divine attributes; or, as he fometimes expreffes it, "Quod humanæ mentis actuale conftituit, eft idea rei fingularis actu exiftentis." Hence, he fays, it follows that the human mind is a part of the intelleet of the infinite God; fo that when we fpeak of the human mind perceiving this or that, we can only mean that God, not as he is infinite, but as he appears in the human mind or conftitntes its effence, has this or that idea; and when we fpeak of God's having this or that idea, ve muft conceive of Him not only as conftituting the luman mind, but as, together with it, having the ided of fomething elfe (A). In another place he tells us, that the human mind is nothing but the idea which

\section*{S P 1}
spinoze, which God has of the human body as actually exitting; that this idea of the body, and the body itfelf, are one and the fame thing; and that thinking and extended fubftances are in reality but one and the fame fubftance, which is fometimes comprehended under one attribute Prop, vii. of the Deity, and fometimes under another*.

If this impious jargon be not Atheifm, or as it has been fometimes called Pantheifm, we know not what it is (fee Pantheism). According to Spinoza, there is but one fubftance, which is extended, infinite, and indivifible. That fubftance indeed he calls God; but he labours to prove that it is corporeal ; that there is no difference between mind and matter ; that both are attributes of the Deity varioufly confidered; that the human foul is a part of the intellect of God; that the fame foul is nothing but the idea of the human body; that this idea of the body, and the body itfelf, are one and the fame thing; that God could not exift, or be conceived, were the vilible univerfe annihilated; and therefore that the vifible univerfe is either the one fubftance, or at leaft an effential attribute or modification of that fubftance. He fometimes indeed fpeaks of the power of this fubftance; but when he comes to explain himfelf, we find that by power he means nothing but blind neceffity \(\ddagger\); and though he frequently talks of the wifdom of God, he feems to make ufe of the word withont meaning. This we think evident from the long appendix to his 36 th propofition; in which he labours to prove that the notion of final caufes is an idle figment of the imagination, fince, according to him, nothing but the prejudices of education' could have led men to fancy that there is any real diftinction between good and evil, merit and demerit, praife and reproach, order and confufion; that eyes were given them that they might be enabled to fee; teeth for the purpofe of chewing their food; berbs and animals for the matter of that food; that the fun was formed to give light, or the ocean to nourifh fighes. If this be true, it is impoffible to difcover wifdom in the operations of his one fuljfance; fince, in common apprehenfion, it is the very characteriftic of folly to act without any end in view.
Such are the reveries of that writer, whofe works a German philofopher of come name has lately recommended to the public, as calculated to convey to the mind more juft and fublime conceptions of God than are to be found in moft other fyttems. The recommendation has had its effect. A literary journalift of our own, reviewing the volume in which it is given, feels a peculiar fatisfaction from the difcovery that Spinoza, inftead of a formidable enemy to the caufe of virtue and religion, was indeed their warmeft friend; and pioufly hopes that we fhall become more cautious not to fuffer ourfelves to be deceived by empty names, which thofe who cannot reafon (Sir Ifaac Newton and Dr Clarke perhaps) give to thofe who can (Hobbes, we fuppofe, and Spinoza). But though we have the honour to think on this queftion with our illuftrious countrymen, we have no defire to depict Spinoza as a reprobate, which Vou. XVII. Part II.
the critic fays has often been done by ignorance and enthufiafm. We admit that his conduct in active life was irreproachable ; and for his fpeculative opinions, he muft ftand or fall to his own Mafter. His Etbics ap- pear to us indeed a fyftem fhockingly impious; and in the tract intitled Pouitica, power and right are confounded as in the former volume; but in the treatife De Intellectus Emendatione, are fcattered many precepts of practical wifdom, as well as fome judicious rules for conducting philofophical inveftigation; and we only regret, that the reader muft wade to them through pages of fatalifm, fcepticifm, and palpahle contradictions. His Compendium Grammatices Lingue Hebraes. though left imperfect, appears to have fo much merit, that it is to be wifhed he had fulfilled his intention of writing a philofophical grammar of that language, in. ftead of wafting his time on abitrufe feculation, which, though they feem not to have been injurious to his own virtue, are certainly not calculated to promote the virtue of others, or to increafe the fum of human happinefs.

SPIR压A, in botany : A genus of plants belong ing to the clafs of icofandria, and to the order of pentasynia; and in the natural fyftem arranged under the 26 th order, Pomacea. The calyx is quinquefid; there are five petals; and the capfule is polyfpermous. There are 18 fpecies; of which two only are Britifh, the filipendula and ulmaria. I. The filipendula, dropwort, has pinnated leaves; the leaflets are ferrated; the ftalk is herbaceous, about a foot and a half high, terminated with a loofe umbel of white flowers, often tinged with red. The petals are generally fix, and the fegments of the calyx are reflexed: the ftamina are 30 or more; the germina 12 or upwards. It grows in mountainous paltures. 2. The ulmaria, meadow-fweet. The leaves have only two or three pair of pinnæ, with a few fmaller ones intermixed ; the extreme one being larger than the reft, and divided into three lobes. The calyx is reddifh; the petals white, and the number of capfules from fix to ten twifted in a fpiral. The tuberous pea, like roots of the filipendula dried and reduced to powder, have been ufed inftead of bread in times of fcarcity. Hogs are very fond of thefe roots. Cows, goats, Theep, and fwine, eat the plant; but horfes refufe it. T'he flowers of the ulmaria have a fragrant fcent, which rifes in diftillation. The whole plant indeed is extremely fragrant, fo that the common people of Sweden ftrew their floors with it on holidays. It has alfo an aftringent quality, and has been found ufeful in dyfenteries, ruptures, and in tanning of leather.

SPIRAL, in geometry, a curve line of the circular kind, which in its progrefs recedes from its centre.

SPIRE, in architecture, was ufed by the ancients for the bafe of a column, and fometimes for the aftragal or tore ; but among the moderns it denotes a fleeple that continually diminifhes as it afcends, whether conically or pyramidally.

SPIRIT, in metaphyfics, an incorporeal being or 4 T intelligence ;
humanam hoc vel illud percipere, nihil aliud dicimus quam quod Deus, non quatenus infinitus eft, fed quatenus per naturam humanæ mentis explicatur, five quatenus humanæ mentis effentiam conttituit, hanc vel illam habet ideam : et cum dicimus Deum hanc vel illam ideam habere, non tantum, quatenus naturam humanæ mentis confituit; fed quatenus fimul cum mente humana alterius rei etiam habet ideam. Corol. prop. xi. part 2.

\section*{S P I [ 698] S P I}

Spirit intelligence ; in which fenfe God is faid to be a fpirit, II as are angels and the human foul. See Metaphysics, Spirituous Liquor. Part III.
Spirit, in chemiftry and pharmacy, a name applied to every volatile liquid which is not infipid like phlegm or water; and hence the ditinction into acid, alkaline, and vinous fpirits. See Pharmacy. Index.

Spirit of Wine. See Chemistry-Index, Distillation, and Pharmacy-Index.

SPIRitis, or Animal Spirits. See Anatomy, Part V. \(n^{\circ} 136\), and Physiology, \(n^{\circ} 185\).

SPIRITUAL, in general, fomething belonging to or partaking of the nature of fpirit. See Spirit.

SPIRITUOUS LiQuors have in all nations been confidered as a proper fubject of heavy taxation for the fupport of the thate. This has naturally occafioned a pice examination of their ftrength. It having been at laft found that this was intimately connected with the fpecific gravity, this has been examined with the moft fcrupulous attention to every circumitance which could affect it, fo that the duties might be exactly proportioned to the quantity of fpirit in any ftrong liquor, independent on every other ciicumflance of flavour or tafte, or other valued quality. The chemift at laft found that the bafis of all ftrong liquors is the fame, produced by the vinous fermentation of pure faccharine matter diffolved in water. He alfo found, that whether this vegetable falt be taken as it is fpontaneoully formed in the juices of plants and fruits, or as it may be formed or extricated from farinaceous fruits and roots by a certain part of the procefs of vegetation, it produces the fame ardent firit, which has always the fame denfity in every mixture with water. The minute portions of aromatic oils, which are in fome degree infeparable from it, and give it a different flavour according to the fubflance from which it was obtained, are not found to have any fenfible effect on its denfity or fpecific gravity. This feems very completely eflablifhed in confequence of the unwearied attempts of the manufacturers to leffen the duties payable on their goods by mixtures of other fubflances, which would increafe their denfity without making them lefs palatable. The vigilance of the rewenue officers was no lefs employed to detect every fuch contrivance. In fhort, it is now an acknowledged point, that the fpecific gravity is an accurate teit of the firength.

But though this is true in general, we cannot derive much benefit from it, unlefs swe know the precife relation between the ftrength and the denfity of a fpirituous liquor. Do they increafe pari paflu, or by what law are they connected? It was natural to expect that equal additions of ardent fpirits or alcohol to a given quantity of water would produce equal diminutions of denfity. Areometers were accordingly made on this principle above 200 years ago, as may be feen in the works of Gafpar Schottus, Sturmius, Agricola, and other old authors. But when mathematical phyfics became more generally known, this was eafily difcovered to be erroneous; and it was fhown (we think firft by Mr Boyle) that equal additions to the fpecific gratity would be produced by fucceffively taking out of al veffel a certain meafure of alcohol and replacing it with an equal meafure of water. This was the moft convenient difcovery for all parties, becaufe then the duties payable on a catk of fpirits would be in the exact pro.
portion of the diminution of its denfity. But it was Spirituons foon found by thofe who were appointed guardians of the revenue that this conclution was crroneous, and that a mixture which appeared by this rule to contain 35 gallons of alcohol, did really contain \(35 \frac{1}{2}\). This they found by actually making fuch a mixture: 18 gallons of alcohol mixed with 18 of water produced only 35 gallons of fpirits. The revenue officers, finding that this condenfation was moft remarkable in mistures of equal parts of water and the ftrongeft firits which could then be procured, determined to levy the duties by this mixture ; becaufe, whether the fpirituous liquor was ftronger or weaker than this, it would appear, by its fpecific gravity, rather ftronger than it really was. This fagacious obfervation, and the fimplicity of the compofition, which could at all times be made for comparifon, feem to be the reafons for our excife offices felecting this mode of eftimating the ftrength and levying the duties. A mixture of nearly equal meafures of water and alcohol is called PROOF SPIR1T, and pays a certain duty per gallon; and the ftrength of a fpirituous liquor is eftimated by the gallons, not of alcohol, but of proof fpirit which the cafk contains. But becaufe it might be difficult to procure at all times this proof fpirit for comparifon, fuch a mixture was made by order of the board of excife : and it was found, that when fix gallons of it was mixed with one gallon of water, a wine gallon of the mixture weighed 7 pounds 13 ounces avoirdupois. 'The board therefore declared, that the fpirituous liquor of which the gallon weighed 7 pounds 13 ounces fhould be reckoned it to 6 or 1 in 7 under proof. This is but an aukward and complex formula; it was ins order to fuit matters to a mode of examination whicls had by time obtained the fanction of the board. Mr Clarke, an ingenious artift of that time, had made a hydrometer incomparably more exact than any other, and conftructed on mathematical principles, fit for computation. This had a fet of weights correfponding to the additions of water or proof fpirit, and the mixture 1 to 6 or 1 in 7 was the only one which weighed an exact number of ounces per gallon without a fraction.

Thus ftands the excife law; and Clarke's hydrometer is ftill the inftrument of authority, although others have been fince conltructed by Dicas, Quin, and others? which are much more ingenious and convenient. The mathematician who examines Dicas's hydrometer, with its nliding feale, by which it is adjufted to the different temperatures, and points out the condenfations, will perceive a beautiful and fagacious combination of quantities, which he will find it difficult to bring under any analytical formula. Perhaps Quin's may have fome preference in refpect of conveniency ; but facile inventis addere. Mr Dicas's was original.

As naturalifts became more accuftomed to exact obfervation in every topic of inquiry, the condenfation which obtains in the mixture of different fubftances became more familiarly known. This evidently affects the prefent queftion; and both the excife and the diftillers are interefted in its accurate decifion. This occafioned an application to the Royal Society ; and a moft fcrupulous examination of the ftrength of firituous liquors was made by Sir Charles Blagden and Mr Gilpin, of which they have given a very particular account in the Philosophical Transactions for 1790 and 1792.

We have taken notice of this in the article Specifie
GRAXITY

Fitious GKAVITY, mentioning fuch circumflances of the refults quors. as fuited our purpofes of phyfical difcuffion. At prefent we give the general refult in the table of fpecific gravity, as peculiarly belonging to fpirituous liquors, affording the moft exact account of their denfity in every thate of dilution of alcohol with water. And as the relation between the proportion of ingredients and the denfity is peculiar to every fubftance, fo that fcarcely any inference can be made from one to another, the reader will confider the tables here given as characteriftic with refpect to alcohol. In all folutions of falts we found that the condenfation increafes continually with the dilution, whereas it is greateft when equal bulks of water and alcohol are mixed: yct we do not confider this as an exception ; for it is certain, that in the frongeft brine the faline ingredient bears but a fmall proportion to the water-and when we mix two folutions, the condenfation is greatef when they are nearly equal in bulk. But we think ourfelves entitled to infer, that alcohol is not a dilution of a fubftance in a quantity of water; but that water, in a certain proportion, not very diftant from what we can produce by flow diftillation, is an ingredient of alcohol, or is one of its component parts, and not merely a vehicle or menftruum. We therefore imagine that proof fpirit contains nearly equal bulks of water and ardent fpirits.

The great difficulty in this examination arofe from the very diffimilar expanfions of water and alcohol by heat. This determined Sir Charles Blagden to eftimate the proportions of ingredients by weight, and made it abfolutely neceffary to give a fcale of fpecific gravity and ftrength for every temperature. For it muft be remark ed, that the queftion (whether in commerce or phitofophy) always is, "How many gallons of alcohol and of water, taken juft now and mixed together, will produce a hundred gallons of the fpirit we are examining ?" The proportion of thefe two will be different according to the temperature of both. As many mixtures therefore mult have been made in each proportion as there were temperatures confidered; but by taking the ingredients by weight, and examining the denfity of the compound in one temperature, it is then heated and cooled, and its change of denfity obferved. Calculation then can tell us the change in the proportion of the bulks or numbers of gallons in the mixture, by means of a previous table fhowing the expantions of water and of alcohol.

The alcohol felected for this examination had the Specific gravity 0,825 . This is not the pureft that can be procured; fome was preduced of 0,816 , of 0,814 , and 0,813 , both obtained from rum, from brandy, and from malt fpirit. We are informed that Dr Black has obtained it of the fpecific gravity 0,8 by digefting alcohol with fixed ammosiac (muriatic acid united with lime) made very dry. It dephlegmates alcohol very powerfully without decompofing it, which always happens when we ufe cautic alkali. Alcohol of 0,825 was chofen becaule expreffed by a number of eafy management in computation.

The examination commenced by afcertaining the expanfions of water and alcohol. The temperature \(60^{\circ}\) of Fahrenheit's fcale was felected for the general temperature of comparifon, being eafily attainable even in cold weather, and allowing the examinator to operate at cafe. The firt and laft copartments of the tables
contain the weights and fpecific gravities of alcohol and Spirituoms water for every fifth degree of heat from \(30^{\circ}\) to \(100^{\circ}\). Liquors. From thefe we have contructed the two following little tables of expanfion. The bulk of 1000 ounces, pounds, or other weight of water and of alcohol of the temperature \(60^{\circ}\), occupies the bulks expreffed in the tables for every other temperature. Water could not be ealily or ufefully examined when of the temperature \(30^{\circ}\), becaufe it is with great difficulty kept fluid in that temperature. It is very remarkable, that when it can be fo kept, it expands inftead of contracting ; while cooling down from \(35^{\circ}\) or thereabouts, and as ir approaches to \(32^{\circ}\), it expands rapidly. We obferve the fame thing in the cryftallization of Glauber falt, martial vitriol, and fome others, which contain much water in their cryftals. We obferve, on the other hand, a remarkable contraction in the zeolite juft before its beginning to fwell into bubbles by a red heat.

This being premifed, the examination was conducte in the following manner. It was determined to mix 100 parts by weight of pure alcohol with five, ten, fifteen, twenty, parts of diftilled water, till they were compounded in equal quantities, and then to mix 100 parts of diftilled water with \(95,90,85,80, \& c\). parts of alcokol, till they were mixed in the proportion of 100 to 5. Thus a feries of mixtures would be obtained, extending from pure alcohol to pure water. This feries would be fuch, that the examinations would be moft frequent in the cafes molt ufual in the commerce of ftrong liquors. A fet of phials, fitted with ground ftoppers, were provided, of fizes fit to hold the intended mixtures. Thefe mixtures were made by fufpending the phial to the arm of a very nice balance, in the oppofite fcale of which (befides the counterpoife of the phial) there was placed the weight 100 . Spirit was then poured into the phial till it exactly balanced the weight 100 . The weight for the water to be added was then put into the oppofite fcale, and water was poured into the phial by means of a flender glais funnel, by fmall quantities at a time, and the phial frequently agitated to promote the mixture. When the additional weight was exactly balanced, the phial was taken off, its ftopper put in, and leather tied over it, and it was fet by, for at leaft a month, that the mixture and the whole
procefs

\section*{S P I [ 700 ] S P I}

Spitituous procefs of condenfation might be completed. The fame

Liquors.
\(\rightarrow\) method was followed in the mixtures where the water was predominant.

When the ingredients of thefe mixtures were judged to have completely incorporated, their fpecific gravity was examined by weighing with the moft fcrupulous precifion the contents of a veffel which held 2925 troy grains of water, of the temperature \(60^{\circ}\). The balance was fo exceedingly fenfible, that the 50 th part of a grain greatly deranged its pofition when loaded with the fcales and their contents. It was conftructed by Mr Ramfden, and fome account of its exquifite fenfibility may be feen in the Fournal de Pby/ique, vol. xxxiii. This quantity of materials was therefore thought abundantly fufficient for afcertaining the denfity of the liquor. It is needlefs to detail the precautions which were taken for having the contents of the weighing bottle brought to the precife temperature proper for the experiment. They were fuch as every perfon converfant with fuch things is accuftomed to take-The bottle had a flender neck, and being put on a lathe, a mark was made round it with a diamond. The botsle was filled till the bottom of the hollow furface of the fluid was in the plane of this mark; and to judge of the accuracy attainable in filling the bottle, the operation was feveral times repeated and the contents weighed, without the difference of \(3^{\frac{1}{0}}\) th of a grain in 2925 . The only fource of error which was to be guarded againft was air-bubbles adhering to the infide of the botrle, or moifture condenfing (in the experiments with Low temperatures) on the outfide. Both of thefe were attended to as much as poffible.

This method of determining the fpecific gravity was preferred to the ufual method, obferving the weight loft by a lump of glafs when fufpended in water; for Mr Gilpin had been enabled, by means of this nice balance, to difcover, even in pure water and in alcohol, a. want of perfect fluidity. Something like vifcidity
rendered the motion of a lump of glafs through the Spirituo liquor fenfibly nuggifh, fo that when the balance was Liquor brought to a level, there was not a perfect equilibrium of weights: (See what we have faid of this matter in Specific Gravity). Mr Gilpin alfo tried the ingenious inftrument propofed for fuch experiments by Mr Ramfden, and defcribed by him in a pamphlet on this very fubject; and he found the anomalies of experiment much greater than in this method by weighing. - Indeed the regular progreffion of weights to be feen in the annexed tables is an unqueftionable proof of the fufficiency of the method; and it has the evident advantage of all other methods in point of fimplicity and practicability without any uncommon apparatus. Any perfon poffeffed of a good ordinary balance and a fet of exact weights may examine all quef. tions of this kind, by weighing pure water and the li. quor which he may have occafion to examine in a com. mon 6 or 8 ounce phial. For this reafon, it is recommended (in preference to all hydrometers) to the board of excife to provide this fimple apparatus in every prin. cipal office.

Every experiment was made at leaft three times; and the mean refult; (which never differed one grain from the extreme) was taken.

From thefe experiments the annexed tables were conftructed. The firft is the fimple abftract of the experiments, containing the weights of the contents of the bottle of every mixture. The fecond contains the fpecific gravities deduced from them.

We have faid that the experiments appear furprifingly accurate. This we fay on the authority of the regular progreffion of the fpecific gravity in any of the horizontal rows. In the feries, for inftance, for the temperature \(60^{\circ}\), the greateit anomaly is in the mixture of 50 parts of fpirit with 100 of water. "The fpecific gravity is 95804 , wanting 3 or 4 of the regular proo greffion. This does not amount to 1 in 18000 .

\section*{S P I}
[ 703 ]
S P I

We formerly obferved, that the feries of mixtures chofen by Sir Charles Blagden, for the advantages attending it in making the experiment, was not fuited for folving the queftions which commonly occur in the firit bufinefs. He accordingly fuggefts the propriety of forming tables in a convenient feries from the data furnifhed by thefe experiments, indicating the proportion of ingredients contained in fome conftant weight or bulk.

To facilitate the conftruction of fuch tables, it is neceffary to confider the fubject in the moft general manner. Therefore let \(a\) reprefent the conftant number 100. Let \(w\) and \(s\) reprefent the quantities of water and firit by weight in any mixture; that is, the pounds, ounces, or grains of each: Let \(x\) reprefent the quantity fer cent. of fpirits alfo by weight; that is, the number of pounds of fpirits contained in 100 pounds of the mixture ; and let \(y\) be its quantity per cent. in gallons, or the number of gallons contained in 100 gallons of the unmixed ingredients. Let \(m\) be the bulk of a pound of firit of any given temperature, the bulk of a pound of water of the fame temperature being accounted 1 .
Then \(w+s\) is the weight of any mixture, and \(w+\) \(m s\) is its bulk.

We have the following proportions: 1.w+s:s=a: \(x\), and \(x=\frac{a s}{w t^{s}}\) (Equation Ift); and hence \(s\) may be found when \(x\) the per centage in weight is given, for \(s\) \(=\frac{w x}{a-x}\) (Equation 2.)
\[
\text { 2. } w+m s: m s=a: y, \text { and } y=a \frac{m s}{w+m s}
\]
quation 3 d ) ; and \(s\) may be found when \(y\), the per centage in gallons, is given; for \(s=\frac{m y}{a-y}\) (Equation 4 th. ).

The rfual queftions which can be folved from thefe experiments are,
I. To afcertain the quantity of fpirits per cent. in bulk from obfervation of the fpecific gravity, or to tell how many gallons of fpirit are in 100 gallons of mixture.

Look for the fpecific gravity in the table, and at the head of the column will be found the \(w\) and \(s\) correfponding. If the precife fpecific gravity obferved is not in the tables, the \(s\) muft be found by interpolation. And here it is proper to remark, that taking the fimple proportional parts of fecific gravity will not be fufficiently exact, efpecially near the beginning or the end of the table, becaufe the denfities correfponding to the feries of mixtures do not change uniformly. We. mult have recourfe to the general rules of interpolation, by means of firft and fecond differences, or be provided with a fubfidiary table of differences. A good deal of practice in computations of this kind fuggetted the following method of making fuch interpolations with great difpatch and abundant accuracy. On a plate of wood, or metal, or ftiff card-paper, draw a line EF (fig. 3.), as a fcale of equal parts, reprefenting the leading or equable arithmetical feries of any table. (In the prefent cafe EF is the fcale of which \(s\) is computed.) Through every point of divifion draw the perpendiculars \(\mathrm{BA}, \mathrm{EC}, \mathrm{FD}\), \&zc. Make one of them AB more confpicuous than the reft, and diftinguifh the others
allo in fuch fort, that the eye fhall readily catch their Spirituous diftance from the principal line A B. Let GPL be a Liquors. thin lip of whalebone, of uniform breadth and thicknefs, alfn divided into equal parts properly diftinguifh. able. Lafly, let there bc a pin P fixed near the middle of the principal line AB.

Now fuppofe that a value of \(s\) is to be interpolated by means of an obferved fpecific gravity not in the table. Look for the neareft to it, and note its diftance from the preceding and the following. Let thefe be PH and PK on the flexible fcale. Alfo take notice of the lines K 10 and H 10 , whofe diftances from A B are equal to the conftant difference between the fucceffive values of S , or to any eafily eftimated multiple of it (as in the prefent cafe we have taken 10 and 10 , inftead of 5 and 5, the running difference of Sir Charles Blagden's table). Then, lcaning the middle point P of the whalebone on the pin P in the board, bend it, and place it flantwife till the points \(K\) and \(H\) fall fomewhere on the two parallels \(\mathrm{K}_{10} 10\) and H ic. No matter how oblique the pofition of the whalebone is. It will bend in fuch a manner that its different points of divifion (reprefenting different fpecific gravities) will fall. on the parallels which reprefent the correfponding values of \(s\). We can fay that all this may be done in lefs than half a minute, and lefs time than is neceffary for infpecting a table of proportional parts, and not the tenth part of that neceffary for irterpolating by fecond differences. Yet it is exact enough (if of the fize of a duodecimo page) for interpolating three decimal places. This is ten times more exact than the prefent cafe re. quires. To return from this digreffion.

Having thus found \(s\) in the table, we get \(x\) or \(y\) byi: the equations \(\frac{a s}{w+s}=x\), and \(a \frac{m s}{w+m s}=y\).

But here a material circumfance occurs. The weight: of alcohol \(s\), and its per centage \(x\), was rightly determined by the fpecific gravity, becaufe it was interpolated? between two values, which were experimentally connected with this fpecific gravity. But in making the tranfition from \(x\) to \(y\), we mly give the per centage. in gallons before mixture, but not the number of gal. lons of alcohol contained in an hundred gallons of mix. ed liquor. For when we have taken \(a-y\) and \(y\) inftead of \(w\) and \(s\), they will indeed make a fimilar compound when mixed, becaufe the proportion of their ingredients is the fame. But they will nut make 100 gallons of this compound, becaule there is a fhrinking or condenfation by mixture, and the fpecific gravity by which we interpolated \(s\) is the phyfical or real fpecific gravity: correfponding to \(w\) and \(s\); while \(\frac{w+s}{w \times m s}\), the fpecific gravity implied in the value of \(\mu\), is the mathematical: denfity independent on this condenfation. Since therefore \(y\), together with \(\overline{a-y}\), make lefs than 100 gal lons of the compound, there mult in 100 gallons of it: be more alcohol than is expreffed by \(y\).

Let \(G\) be the mathematical feecific gravity ( \(=\) \(\left.\frac{w+s}{w+m s}\right)\), and \(g\) the phyfical or real obferved fpecific gravity (which we cannot exprefs algebraically) ; and let \(z\) be the gallons of alcohol really contained in 100 gallons of the crompound. The bulk being inverfely as the denfity or fpecific gravity, it is, evident that the: L.

\section*{\(S\) P I}
spiriterous bulk of the compound mut be to 100 gallons as \(g\) to

\section*{Liquors.}

\section*{And fince we want to make it ftill up to 100}
gallons, we mult increafe it in the proportion of \(G\) to g. And becaufe this augmentation mult be of the fame ftrength with this contracted liquor, both ingredients mult be increafed in the proportion of G to \(g\), and we muft have \(\mathrm{G}: g=y: z\), and \(z=g \times \frac{y}{\mathrm{G}}\). Now, in. Atead of \(y\), write \(a \frac{m s}{w+m s}\), and inftead of \(\frac{1}{G}\) write \(\frac{w+m s}{w+s}\), which are refpectively equal to them. This gives us \(z=g a \times \frac{w+m s}{w+s} \times \frac{m s}{w+s},=g a \times \frac{m s}{w+s}\).

All this will be illuftrated by an example.
Suppofe that we have obferved the fpecific gravity of a firituous liquor of the temperature \(60^{\circ}\) to be \(0,94128\). Looking inte Sir Charles Blagden's table, we find the gravities 0,94018 and 0,94296 , and the \(s\) correfponding to them is 80 and 75 , the water in each mixture being 100 . By interpolation we obtain the \(s\) correfponding to 0,94128 , viz. \(7^{8}\). At this temperature \(m\) \(=\frac{1}{0,825},=1,21212\), and \(m s=94,54545\). There. fore \(z=0,94128 \times 100 \times \frac{94,54545}{194,54545},=49,997\), or very nearly 50 .

We have feen even perfons not unacquainted with fubjects of this kind puzzled by this fort of paradox. \(z\) is faid to be the per centagc of fpirit in the compound. The compound has the fame proportion of ingredients when made up to 100 gallons as before, when \(y\) was faid to be its per centage, and yet \(y\) and \(z\) are not the fame. The fact is, that although \(\approx\) is the number of gallons of alcohol really contained in 100 gallons of the compound, and this alcohol is in the fame proportion as before to the water, this proportion is not that of 50 to 50 : for if the ingredients were feparated again, there would be 50 gallons of alcohol and 52,876 of water.

The proportion of the ingredients in their feparate Itate is had by the 3 d Equation \(y=a \frac{m s}{w+m s}\), which is equivalent to \(\mathrm{G} a \frac{m s}{w+s}\). For the prefent example \(y\) will be found 48,599 , and \(a-y\), or the water per cent. \(5 \mathrm{I}, 40 \mathrm{I}\), making 100 gallons of unmixed ingredients. We fee then that there has been added 1,398 gallons of alcohol ; and fince both ingredients are augmented in the proportion of \(G\) to \(g\), there have alio been added 1,478 of water, and the whole addition for making up the 100 gallons of compound is 2,876 gallons; and if the ingredients of the compound were feparate, they would amount to 102,876 gallons. This might have been found at the firft, by the proportion, \(\mathrm{G}: g-\mathrm{G}=100:\) (The addition.)

The next queftion which ufually occurs in bufinefs is to find what denfity will refult from any propofed mixture per gallon. This queftion is folved by means of the equation \(\frac{w y}{m(a-y)}=s\). In this examination it will be moft convenient to make \(w=a\). If the value of \(s\) found in this manner falls on a value in the tables, we have
the fpecific gravity by infpection. If not, we mult in terpolate.
\(N . B\). The value of \(m\), which is employed in thefe reductions, varies with the temperature. It is always obtained by dividing the fpecific gravity of alcohol of that temperature by the fpecific gravity of water of the famc temperature. The quotient is the real fpecific gravity of alcohol for that temperature. Both of thefe are to be had in the firft and laft copartments of Sir Charles Blagden's table.

Thefe operations for particular cafes give the anfwers to particular occafional queftions. By applying them to all the numbers in the table, tables may be conftruct. ed for folving every queftion by infpection.

There is another queftion which occurs moft frequently in the excife tranfactions, and alfo in all compofitions of fpirituous liquors, viz. What ftrength will refult from a mixture of two compounds of knowa ftrength, or mixing any compound with water? To folve queftions of this kind by the table fo often quoted, we muft add into one fum the water per gallon of the different liquors. In like manner, take the fum of the fpirits, and fay, as the fum of the waters is to that of the alcohols, fo is \(a\) to \(s\); and operate with \(a\) and \(s\) as before.

Analogous to this is the queftion of the duties. Thefe are levied on proof fpirit; that is, a certain duty is charged on a gallon of proof fpirit; and the gauger's bufine?s is to difcover how many gallons of proof fpirit therc is in any compound. The fpecification of proof fpirit in our excife laws is exceedingly obfcure and complex. A gallon weighing 7 pounds 13 ounces (at \(55^{\circ}\) ) is accounted 1 to 6 under proof. The gallon of watcr contains 58476 grains, and this firit is 54688. Its denfity therefore is 0,93523 at \(55^{\circ}\), or (as may be inferred from the table) 0,9335 at \(60^{\circ}\). This denfity correfponds to a mixture of 100 grains of water with 93,457 of alcohol. If this be fuppofed to refult from the mixture of 6 gallons of alcohol with 1 of water (as is fuppofed by the defignation of 1 to 6 under proof), the gallon of proof firits confifts of 100 parts of fpirits by weight, mixed with 75 parts of water. Such a fpirit will have the denfity 0,9162 nearly.

This being premifed, in order to find the gallons of proof firits in any mixture, find the quantity of alcohol by weight, and then fay, as 100 to 175 , fo is the alcohol in the compound to the proof fpirit that may be made of it, and for which the duties muft be paid.

We have confidered this fubject at fome length, becaufe it is of great importance in the firit-trade to have thefe circumftances afcertained with precifion; and becaufe the fpecific gravity is the only fure criterion that can be had of the ftrength. Firing of gunpowder, or producing a certain bubble by fhaking, are very vague tefts; whereas, by the feecific gravity, we can very fecurely afcertain the ftrength within one part in 500, as will prefently appear.

Sir Charles Blagden, or Mr Gilpin, have publifhed * a moft copious fet of tables, calculated from thefe valu- \(\mathcal{T}_{\text {ranf.ils }}^{\rho_{\text {sit }}}\) able experiments. In thefe, computations are made for every unit of the hundred, and for every degree of the thermometer. But thefe tables are ftill not in the moft commodious form for bufinefs. Mr John Wilfon, an ingenious gentleman refuding at Dundee, has juft pub-

\section*{S P I [ 705\(]\) S P I}
aious lifhed at Edinburgh tables fomewhat fimilar, founded on the fame experiments. Both of thefe tables fhow the quantities by meafure correfponding to every unit by weight of Sir Charles Blagden's experiments, and for every degree of temperature. They alfo thow the fer centage of alcohol, and the condenfation or the quan. tity loft by mixture. But as they both retain the original feries of parts by weight, which is very unufual, the fpirit traders will find confiderable difficulty in making ufe of them. Retaining this feries alfo caufes all the per centage numbers (which are the only interefting ones to the trader) to be fractional, and no anfwer can be had without a double interpolation.

We have therefore calculated a table in the form in which it mult be moft ufeful and acceptable to thofe who are engaged in the fpirit trade, fhowing at once the fpecific gravity which refults from any proportion of admixture in hundredth parts of the whole. 'This anfwers immediately the chief queftions in the terms in which they are ufually conceived and propofed. The two firft or leading columns fhow the proportion in gal lons, pints, or other cubic meafures, of the mixture, the whole quantity being always 100 . The fecond column fhows the correfponding fpecific gravity: fo that we can either find the proportion of the ingredients by the
obferved fpecific gravity, or find the grav ty refulting \(S_{i}\) iritusus from any proportion of the ingredients. iA third co Liquors. lumn hows how much the hundred meafures of the two ingredients fall fhort of making an hundred meafures of the compound. A fimplc proportion, which can be done without the pen, will determine what part of this deficiency muft be made up by firit. The ufe of this table muit now be fo familiar to the reader's mind, that we need not give further inftructions about it.
This is followed by another fimilar table, giving an immediate anfwer to the moft ufual quettion, "How many meafures of alcohol are there really contained in roo meafures? This is alfo accompanied by a column of condenfation. It would have been fomewhat more elegant, had the fpecific gravities in this table made the equable feries and leading column. Bur we did not ad vert to this till we had computed the table, and the labour was too great to be repeated for flight reafons. The tables are only for the temperature \(60^{\circ}\). To this the fipituous liquors can always be brought in thefe climates; and in cafes where we cannot, a moment's in fpection of Sir Charles Blagden's table will point out very nearly (or exactly, by a Thort computation) the neceffary corrections.

\({ }^{66}\) In the firt table, of which the fole intention is to point out the proportion of ingredients, the \{pecific gravities are computed only to four places, which will always give the anfwer true to \(\frac{r^{2}}{80}{ }^{-1}\) th part In the laft, which is more immediately interefting to the merchant in his tranfactions with the excife office, the computation is carried one place further"

The confideration of the firft of thefe two tables will furnifh fome ufeful information to the reader who is interefted in the philofophy of chemical mixture, and who endeavours to inveftigate the nature of thofe forces which connect the particles of tangible matter. Thefe vary with the diftance of the particle; and therefore the law of their action, like that of univerfal gravitation, is to be difcovered by meafuring their fenfible effects at their various diftances. Their change of diftance is feen in the change of denfity or fpecific gravity.

Did the individual denfities of the water and firit remain unchanged by mixture, the fecific gravity would change by equal differences in the feries of mixtures on which this table is conftructed; for the bulk being always the fame, the change of fpecific gravity maft be the difference between the weight of the gallon of water which is added and that of the gallon of fpirit which
is taken out. The whole difference of the fpecific gravities of Spirits and water being 1,750 parts in 10,000, the augmentation by each fucceffive change of a meafure of fpirit for a meafure of water would be the sooth part of this, or 17,5 . But, by taking the fucceffive differences of denfity as they occur in the table, we fee that they are valtly greater in the fint additions of water, being then about 29 ; after which they gradually diminifh to the medium quantity \(17 \frac{8}{2}\), when water and fpirits are mixed in nearly equal bulks. The differences of fecific gravity ftill diminifh, and are reduced to 9 , when about 75 parts of water are mixed with 25 of fpilit. The differences now increafe again ; and the laft, when 99 parts of water are mixed with 1 part of Spirit, the difference from the fpecific gravity of pure water is above 14.

The mechanical effect, therefore, of the addition of a meafure of water to a great quantity of Spirit is greater than the fimilar effect of the addition of a meafure of fpirits to a great quantity of water. What we call mechanical effect is the local motion, the change of diftance of the particles, that the corpufcular forces may again be in equilibrio. Obferve, too, that this change is greater than in the proportion of the diftance of the
particles;

\section*{S P I [ 707 ] S P L}
particles; for the denfity of water is to that of fpirits nearly as 6 to 5 , and the changes of fpecific gravity are nearly as 6 to 3 .

We alfo fee that the changing caufe, which produces the abfolute condenfation of each ingredient, ceafes to operatc when 75 parts of water have been mixed with 25 of alcohol: for the variation of fpecific gravity, from diminifhing comes now to increafe ; and therefore, in this particular ftate of compofition, is equable. Things are now in the fame ftate as if we were mixing two fluids which did not act on each other, but were mutually diffeminated, and whofe fpecific gravities are nearly as 9 to 10 ; for the variation 9 of fpecific gravity may be confidered as the rooth part of the whole difference, in the fame manner as 17,5 would have been had water and alcohol fuftained no contraction.

The imagination is greatly affifted in the contemplation of geometrical quantity by exhibiting it in its own form. Specific gravity, being an expreffion of denfity (a notion purely geometrical), admits of this illutration.

Therefore let \(A B\) (fig. 4.) reprefent the bulk of any mixture of water and alcohol. The fpecific gravity of water may be reprefented by a line of fuch a length, that AB fhall be the difference between the gravities of alcohol and water. Suppofe it extended upwards, towards \(a\), till \(\mathrm{B} a\) is to \(\mathrm{A} a\) as 10,000 to 8250 . It will fuit our purpofe better to reprefent it by a parallelogram \(a \mathrm{BF} e\), of any breadth BF . In this cafe the difference of the fpecific gravities of alcohol and water will be expreffed by the parallelogram \(A B F E\). If there were no wange produced in the denfity of one or both ingredients, the fpccific gravity of the compound would increafe as this parallelogran does, and AGHE would be the augmentation correfponding to the mixture of the quantity AG of alcohol with the quantity GB of water, and fo of other mixtures. But, to exprefs the augmentation of denfity as it really obtains, we muft do it by fome cuvilineal area 1) ABCHD, which varies at the rate determined by Sir Charles Blagden's experiments. This area muft be preeifely equal to the rectangle \(A B F E\). It mult therefore fall without it in fome places, and be deficient in others. Let DMHKC be the curve which correfponds with thefe experiments. It is evident to the mathematical reader, that the ordinates LM, GH, IK, \&c. of this curve are in the ultimate ratio of the differences of the obferved fipecific gravities. If \(\mathrm{A} \alpha, \alpha \beta\), \&c. are each \(=5\), the little fpaces A \(\propto \delta D, \alpha \beta b \delta, \& c\). will be precifely equal to the differences of the fpeci.c. gravities 0,\(8250 ; 0,8387 ; 0,8516\); \&c. correfponding to the different mixtures of water and alcohol. The curve cuts the fide of the parallelogram in K, where the ordinate GK expreffes the mean variation of denfity \(0,0017,5\). IK is the fmalleft variation. The condenfation may be expreffed by drawing a curve \(d m\) Gkf parallel to DMGKF, making \(\mathrm{D} d=\mathrm{AE}\). The condenfation is now reprefented by the fpaces comprehended between this laft curve and the abfciffa AGB, reckoning thofe negative which lie on the other fide of it. This fhows us, not only that the condenfation is greatelt in the mixture \(A G \times G B\), but alfo that in mixing fuch a compound with another \(A I \times I B\), there is a rarefaction. Another curve ANPOB may be drawn, of which the ordinates LN, GP, IO, \&c. are proportional to the areas \(\mathrm{AL} m d, \mathrm{AG} m \mathrm{D}\),

AIkGmD (=AGmd-GIk), \&c. This curve fhow's Spiritunus the whole condenfation.

This manner of reprefenting the fpecific gravities of mixtures will fuggett many curious interences to fuch as will confider them in the manner of Bofcovich, with a view to afcertain the nature of the forces of cohefion and chemical affinities: And this manner of viewing the fubject becomes every day more promifing, in confequence of our improvements in chemical knowledge; for we now fee, that mechanifm, or motive forces, are the caufes of chemical action. We fee in almoft every cafe, that chemical affinities are comparable with mechanical preffures; becaufe the converfion of a liquid into a vapour or gas is prevented by atmofpheric prcffure, and produced by the great chemical agent heat. The action of heat, therefore, or of the caufe of heat, is a meehanical action, and the forces are common mechanical forces, with which we are familiarly acquainted.
"It may be alfo remarked in the column of contrac. tions, that in the beginning the contractions augment nearly in the proportion of the quantity of fpirits (but more flowly) ; whereas, in the end, the contractions are nearly in the duplicate proportion of the quantity of water. This circumftance deferves the confideration of the philofopher. We have reprefented it to the eye by the curve a \(g b d\)."

We fhould here take fome notice of the attempt made to elude fome part of the duties, by adding fome ingredient to the fpirits. But our information on this fubject is not very exact ; and befides it would be doing no fervice to the trader to put fraud more in his power. There are fome falts which make a very great augmentation of deufity, but they render the liquor unpalatable. Sugar is frequently ufed with this view; 16 grains of refined fugar diffolved in 1000 grains of proof fpirits gave it no fufpicious talte, and increafed its ipecific gravity from \(c, 920\) to 0,925 , which is a very great change, equivalent to the addition of 9 grains of water to a mixture of 100 grains of alcohol and 80 of water.

SPITHEAD, a road between Portfmouth and the Ine of Wight, where the royal navy of Great Britain frequently rendezvous.

SPITTLE, in phyfiology. See Saliva.
SpitzBERGEN. See Greenland, nº io.
SPLACHNUM, in botany: A genus of plants belonging to the clafs of cryptogamia, and order of mufci. The anthere are cylindrical, and grow on a large coloured apophyfis or umbraculum. The calyptra is ca* ducous. The female ftar grows on a feparate ftem. There are fix fpecies, the rubrum, luteum. fphæricum, ampullaceum, vafculofum, anguftatum. Two of thefe are natives of Britain.
1. The ampullaceum, or crewet fplachnum, is found in bogs and marhes, and often upon cow-dung. It grows in thick tufts, and is about two inches high: The leaves are oval lanceolate, terminated with a long point or beard. The top of the filament or peduncle fwells into the form of an inverted cone, which Linnæus terms an apophytis or umbraculum; upon the top of which is placed a cylindrical anthera, like the neck of a crewet. The calyptra is conical, and refembles a fmall extingguifher.
2. The vafculofum, or acorn-fhaped fplachnum, is found upon bogs and cow-dung, and upon the points of

Spleen rocks on the top of the Highland mountains, as on Sporiation. Ben-Lomond, and in the. Inte of Sky, and elfewhere. This differs little from the preceding, and perhaps is no more than a variety. The filaments are about an inch high. The leaves oval-acute, not fo lanceolate and bearded as the other. The apophyfis, and the anthera at the top of it, form together nearly an oval figure, not unilike an acorn in its cup, the apophyfis being tranfverfely femi-oval, and of a blood-red colour, the anthera fhort and conical. The calyptra is the fame as that of the other. The operculum is thort and obtufe, and the rim of the anthera has eight large horizontal cilia. The anthera of the other is alfo ciliated, but not fo difinetly. It is an elegaut mofs, and very diftinguifhable on account of its orange-coloured filaments and dark-red capfules.

SPLEEN, in anatomy. See Anatomy, \(\mathrm{n}^{\circ} 99\).
Splekn-Wort. See Asplenium.
SPLENETIC, a perfon afflifted with an obftruction of the fpleen.

SPLENT, or Splint, among farriers, a callous infenfible excrefcence, breeding on the fhank-bone of horfes. See Farriery, Sect. xxxi.

SPLICING, in the fea-language, is the untwifting the ends of two cables or ropes, and working the feveral ftrancis into one another by a fidd, fo that they beconte as Atrong as if they were but one rope.

SPOILS, whatever is taken from the enemy in time of war. Among the ancient Greeks, the fpoils were divided among the whole army ; only the general's fhare was largeft : but among the Romans, the fpoils belong. ed to the republic.

SPOLETTO, a duchy of Italy, bounded on the north by the Marquifate of Ancoria and duchy of Urbino, on the eaft by Farther Abruzzo, on the fouth by Sabina and the patrimony of St Peter, and on the weft by Orvierano and Perugino. It is about 55 miles in lensth and \(4^{\circ} \mathrm{in}\) breadth. It was anciently a part of Umbria, and now belongs to the Pope. - The name of the capital city is alfo Spoletto. It was formerly a large place, but in 1703 was ruined by an earthquake; from whence it has never recovered itfelf.

SPOLIATION, in ecclefiattical law, is an injury done by one clerk or incumbent to another, in taking the fruits of his benefice without any right thereunto, but under a pretended title. It is remedied by a decree to account for the profits fo taken. 'I'his injury, when the jus patronatus, or right of advowfon, doth not come in debate, is cognizable in the fpisitual court : as if a patron firft prefents \(A\) to a benefice, who is inftituted and inducted thereto; and then, upon pretence of a vacancy, the fame patron prefents \(B\) to the fame livings, and he alfo obtains inftitution and induction. Now if A difputes the fact of the vacancy, then that clerk who is kept out of the profits of the living, whichever it be, may fue the other in the fpiritual court for fpoliation, or taking the profits of his benefice. And it fhall there be tried, whether the living were or were not vacant; upon which the validity of the fecond clerk's pretenfions muft depend. But if the right of patronage comes at all into difpute, as if one patron prefented \(A\), and another patron prefented B, there the ecclefiaftical court hath no cognizance, provided the tithes fued for amount to a fourth part of the value of the living, but may be prohibited at the in-
fance of the patron by the king's writ of indicarit, So allo if a clerk, without any colour of title, ejects another from his parfonage, this injury inutt be redreffed in the temporal courts: for it depends upon no queftion determinable by the (piritual law (as plurality of benefices or no plurality, vacancy or no vacancy), but is merely a civil injury.

SPONDEE, in ancient poetry, a foot confifting of two long fyllables, as omnes.

SPONDIAS, Brasilian or Jamaica Plum, in botany; a genus of plants beionging to the clafs of decandria, and order of pentagynia. The calyx is quinquedentate. The corolla pentapetalous. The fruit contains a quinquelocular kernel. There are only two fpecies, the mombin and myrobalanus, which appear fo mich confounded in the defcriptions of different botanifts, that we do not venture to prefent them to our readers.

SPONGIA, Sponge, in natural hiftory; a genus of animals belnging to the clafs of vermes, and order of zoophyla. It is fixed, flexible, and very torpid, growing in a variety of forms, compofed either of reticulated fibres, or raffes of fmall fpines interwoven together, and clothed with a living gelatinous flefh, full of fmall mouths or holes on its furface, by which it fucks in and throws out the water. Fifty fpecies have already been difcovered, of which 10 belong to the Britih coafts.
1. Oculata, or branched fponge, is delicately foft and very much branched; the branches are a.little compreffed, grow erect, and often united together. They have rows of cells on each margin, that project a little. This fpecies is of a pale yellow colour, from five to ten inches high. The fibres are reticulated, and the fle \(\mathrm{h}_{\mathrm{r}}\) or gelatinous part is fo tender, that when it is taken out of the water it foon dries away. It is very common round the fea-coaft of Britain and Ireland. This defcription will be better underfood by Plate cccclxxy. fig. i. At \(b, b\), along the edges and on the furface of the branches, are rows of fmall papillary holes, through which the animal receives its nourifhment.
2. Griftata, or cock's comb fonge, is flat, erect, and foft, growing in the Thape of cock's combs, with rows of little holes along the tops, which project a little. It abounds on the rocks to the eaftward of Haftings in Suffex, where it may be feen at low-water. It is commonly about three inches longy and two inches high, and of a pale yellowifh colour. When put into a glafs. veffel of fea-water, it has been obferved to fuck in and fquirt out the water through little mouths along the tops, giving evident figns of life.
3. Stupofa, tow-fponge, or downy branched fponge, is foft like tow, with round branches, and covered with: fine pointed hairs. It is of a pale yellow colour, and about three inches high. It is frequently thrown on the fhore at Haftings in Suffex. Fig. 2. reprefents this, fponge; but it is fo clofely covered with a fine down, that the numerous fmall holes in its furface are not dif. cernible.
4. Dichotoma, dichotomous or forked fponge, is ftiff, branched, with round, upright, elaftic branches, covered with minute hairs. It is found on the coaft of Norway, and alfo, according to Berkenloout, on the Cornifh and Yorkhire coafts. It is of a pale yellow colour, and full of very minute pores, guarded by minute finires. Fig. 3.

\section*{S P O}
5. Urens or tomentofa, flinging pone, or crumb of bread sponge, is of many forms, full of pores, very brittle and fort, and interwoven with very minute fines. It is full of fall protuberances, with a hole in each, by which it fucks in and throws out the water. It is very common on the British coat; and is frequently feed furrounding fucufes. It is found alpo on the flores of North America, Africa, and in the Eat Indies. When newly taken out of the fa, it is of a bright orange colour, and full of gelatinous flesh; but when dry, it becomes whitifh, and when broken has the appearance of crumb of bread. If rubbed on the hand, it will raife bitters; and if dried in an oven, its power of tinging is much increafed, especially that variety of it which is found on the fea-coaft of North America.
6. Pulmata, palmated Sponge, is like a hand with fingers a little divided at the top. -The mouths are a little prominent, and irregularly difpofed on the furface. It is found on the beach at Brighthelmftone. It is of a reddifh colour, inclining to yellow, and of the fame fort woolly texture with the fpongia oculata, fig. 4.
7. Coronata, coronet fponge, is very fall, confilting of a fingle tube furronded at top by a crown of little fines. The tube is open at the top. The rays that compose the little crown are of a bright, fining pearl colour; the body is of a pale yellow. It has been found in the harbour of Emfworth, between Suffix and Hampshire.
8. Botryoides, grape fponge, is very tender and branched, as if in bunches: the bunches are hollow, and are made up of oblong oval figures having the appearance of grapes; and each bunch is open at top. This fpecies is of a bright, thining colour. The openings at the top are evidently the mouths by which the animal imbibes and difcharges moiture. When the furface is very much magnified, it appears covered with little maffes of triple, equidiftant, Shining fines.
9. Lacyftris, creeping fponge, has erect, cylindrical, and obtufe branches. It is found in lakes in Sweden and England.
10. Fluviatilis, river fponge, is green, erect, brittle, and irregularly difpofed in numerous branches. It abounds in many parts of Europe, in the fresh rivers of Ruffia and England, but particularly in the river Thames. It fcarcely exhibits any fymptoms of life, is of a fifty fuel : its pores or mouths are fometimes filled with green gelatinous globules. It differs very little from the lacuftris.

So early as the days of Arifotle fponges were Cuppored to poffefs animal life; the perfons employed in collecting them having obferved them Shrink when torn from the rocks, thus exhibiting fymptoms of lenfation. The fame opinion prevailed in the time of Pliny: But no attention was paid to this fubject till Count Marfigli examined them, and declared them vegetables. Dr Peyfonell, in a paper which he rent to the Royal Society in the year \(175^{2}\), and in a fecond in 177.7, affirmed they were not vegetables, but the production of animals; and has accordingly defcribed the animals, and the process which they performed in making the sponges. Mr Ellis, in the year 1762 , was at great pains to discover there animals For this purpofe he diffected the fpongia urens, and was furprifed to find a great number of fall worms of the genus of nereis or fea-fcolopendra, which had pierced their way through
the fort fubfance of the Sponge in queft of a fafe re- Sponfor treat.I 'That this was really the cafe, he was fully aflured of, by infecting a number of specimens of the fame fort of sponge, jut fresh from the lea. He put them into a glass filled with fea-water; and then, instead of feeing any of the little animals which Dr Peyfonell defcribed, he observed the papilla or fall holes with which the papiliæ are furrounded contract and dilate themfelves. He examined another variety of the fame Species of fonge, and plainly perceived the fall tubes infpire and expire the water. He therefore concluded, that the forge is an animal, and that the ends or openings of the branched tubes are the mouths by which it receives its nourifmment, and difcharges its excements.

SPONSORS, among Chriftians, are thole perfons who, in the office of baptifm, anfwer or are fureties for the perfons baptized.

SPONT'ANEOUS, a term applied to fuch motions of the body and operations of the mind as we perform of ourfelves without any constraint.

SPOON-blll, in ornithology. See Platalea.
SPOONING, in the fea-language, is faid of a hip, which being under fail in a form at fea, is unable to bear it, and confequently forced to go right before the wind.
SPORADES, among ancient aftronomers, a name given to fuch tars as were not included in any conflellotion.

SPORADIC diseases, among phylicians, are fuch as feize particular perfons at any time or feafon, and in any place; in which fenfe they are diftinguifhed from epidemical and endemical difeafes.

SPOTS, in aftronomy, certain places of the fun's or moon's dink, observed to be either more bright or dark than the ref; and accordingly called facula \(\mathcal{F}\) macula. See Astronomy-Index.

SPOTSWOOD (John), archbiftiop of St Andrew's in Scotland, was defended from the laid of Spotiwood in the Merfe, and was born in the year 1565. He was educated in the univerfity of Glafgow, and fuccteded his father in the parsonage of Calder when but 18 years of age. In 1601 he attended Lode. wick duke of Lennox as his chaplain, in an embaffy to the court of France for confirming the ancient amity between the two nations, and returned in the ambaffador's retinue through England. When he entered into the archbishopric of Glafsow, he Pound there was not \(1 \geqslant 01\). Sterling of yearly revenue left; yet fuch was his care for his fucceffors, that he greatly improwed it, and much to the fatisfaction of his dincefe. Af. ter having filled this fee 11 years, he was raifed to that of St Andrew's in 1615 , and made primate and metropolitan of all Scotland. He prefided in feveral affemblies for reltoring the ancient difcipline, and bringing the church ot Scotland to forme fort of uniformity with that of England. He continued in high efteem with king James I. nor was he left valued by king Charles I. who was crowned by him in 1633 , in the abbeychurch of Holyroodhoufe. In \(\mathbf{1} 635\), upon the death of the earl of Kinnoul chancellor of Scotland, our mrimate was advanced to that polit ; but had fcarcely held it four years, when the contufions beginning in Scotland, he was obliged to retire into England; and being broken with age, grief, and ficknefs, died at London in

\section*{\(S \quad \mathrm{P} R\)}

Spout

- Siring. 203 to the reign of king James VI. in folio.

1639 , and was interred in Wefminfter-abbèy. He wrote A Hittory of the Church of Scotland from the year

SPOU'I, or Water-Spout. See Water-Spout.
Spout-Fifh. See Solen.
SPRAT (Dr Thomas), bifhop of Rochefter, was born in 163 K . He had his education at Oxfo:d, and after the Reftoration entered into holy orders. He becane fellow of the Royal Society, chaplain to George duke of Buckinrham, and chaplain in ordinary to king Charles II. In 667 he publifhed the Hiftory of the Royal Society, and a Life of Mr Cow ley ; who, by his laft will, left to his care his printed works and MSS. which wu:e accordingly publifhed by him. In 668 he was inftalled prebendary of Wettminfter ; in 1680, was appointed canon of Windfor ; in 1683 , dean of Weftminitter; and in 1684 , confecrated to the bifhopric of Rochefter. He was clerk of the clofet to king James II.; in 1685 , was made dean of the chapel royal; and the year following, was appointed one of the commiffioners for ecclefiaftical affairs. In 1692 his lordfhip, with feveral other perfons, was charged with tieafon by two men, who drew up an affociation, in which they whofe names were fubferibed declared their refolution to reftore king James; to feize the princefs of Orange, dead or alive; and to be ready with 30,000 men to meet king James when he fhould land. To this they put the names of Sancroft, Sprat, Marlborough, Salifbury, and others. The bifhop was surreftec, and kept at a meffenger's, under a ftrict guard, for eleven days. His houfe was fearched, and his papers feized, among which nothing was found of a trea-- fonable appearance, except one memorandum, in the following words: Thorongb-paced dotrine. Being afked at his examination the meaning of the words, he faid that, about 20 years before, curiofity had led him to hear Daniel Burgefs preach ; and that being ftruck with his account of a certain kind of doctrine, which he faid cntered at one ear, and pacing through the bead. went out at the other, he had inferted the memorandum in his table-book, that he might not lofe the fubftance of to frange a formon. His innocence being proved, he was fet at liberty, when lie publifhed an account of This examination and deliverance; which made fuch an impreffion upon him, that he commemorated it through life by an yearly day of thankfgiving. He lived to the 79th year of his age, and died May 20. 1713. His works, befides a few poems of little value, are, "The Hiftory of the Royal Society ;" "The Life of Cowley ;" "The Anfwer to Sorbiere;" "The Hiftory of the Rye-houfe Plot;" "The Relation of his own Examination;" and a volume of "Sermons." Dr Johnfon fays, "I have heard it obferved, with great juftnefs, that every book is of a different kind, and that each has its diftinct and charactcriftical excellence."

Sprat, in ichthyology. See Clupea.
SPRAY, the fprinkling of the fea, which is driven from the top of a wave in ftormy weather. It differs from fpoon.drift, as being only blown occafionally from the broken furface of a high wave; whereas the latter continues to fly horizontally along the fea, without iritermiffion, during the excefs of a tempeft or hurricane.

SPRING, in natural hiftory, a fountain or fource of water rifing out of the ground.

Many have been the conjectures of philofophers con-

\section*{\(710]\) \(S\) P R}
cerning the origin of fountains, and great pains have Spring. been taken both by the nembers of the Royal Society and thole of the Academy of Sciences at Paris, in order to afcertain the true caufe of it. It was Ariftotle's opinion, and held by moft of the ancient philofophers after him, that the air contained in the caverns of the earth, being condenfed by cold near its furface, was thereby changed into water; and that it made its way through, where it could fuad a paffare. But we have no experience of any fuch tranfmutation of air into water.

Thofe who imagine that fountains owe their orizgin to waters brought from the fea by fubterraneous ducts, give a tolerable account how they lofe their faltnefs by percolation as they pafs through the earth : but they find great difficulty in explaining by what power the water rifes above the level of the fea to near the tops of mountains, where fprings generally abound ; it being contrary to the laws of hydroftatics, that a fluid fhould rife in a tube above the level of its fource. However, they have found two ways whereby they endeavour to extricate themfelves from this difficulty. The one is that of Des Cartes, who inagines, that after the water is become frefh by percolation, it is raifed out of the caverns of the earth in vapour towards its furface; where meeting with rocks near the tops of mountains in the form of arckes or vaults, it flicks to them, and runs down their fides, (like water in an alembic), till it meets with proper receptacles, from which it fupplies the fonntains. Now this is a mere hypothefis, without foundation or probability : for, in the firt place, we know of no internal heat of the earth to caufc fuch evaporation ; or if that were allowed, yet it is quite incredible that there fhould be any caverns fo fmooth and void of protuberances as to anfwer the ends of an alembic, in collecting and condenfing the vapours together in every place where fountains arife. There are others (as Varenius, \&c.) who fuppofe that the water may rife through the pores of the carth, as through capillary tubes by attraction. But hercby they fhow, that they are quite unacquainted with what relates to the motion of a fluid through fuch tubes: for when a capillary tube opens into a cavity at its upper end, or grows larger and largcr, fo as to ceafe to be capillary at that end, the water will not afcend through that tube into the cavity, or beyond whete the tube is capillary; becaufe that part of the periphery of the cavity, which is partly above the furface of the water and partly below it, is not of the capillary kind. Nay, if the cavity is continually fupplied with water, it will be attracted into the capillary tube, and run down it as through a funnel, if the lower end is immerged in the fame fluids. as in this cafe it is fuppofed to be.

It has been a generally received opinion, and much efpoufed by Mariotte (a diligent oblerver of nature), that the rile of fprings is owing to the rains and melted fnow. According to him, the rain-water which falls upon the hills and mountains, penetrating the furface, meets with clay or rocks contiguous to each other; along which it runs, without being able to penetrate them, till, being got to the bottom of the mountain, or to a confiderable diftance from the top, it breaks out of the ground, and forms fprings.

In order to examine this opinion, Mr Perrault, De la Hire, and D. Sideleau, endeavoured to make an eftimate

\section*{S P R [ 7II ] S P R}
pring. eftimate of the quantity of rain and fnow that falls in the fpace of a year, to fee whethes it would be fuffici. ent to afford a quantity of water equal to that which is annually difcharged into the fea by the rivers. The refult of their inquiries was, that the quantity of rain and fnow which fell in a year into a cylindrical veffel would fill it (if fecured from evaporating) to the height of about nineteen inches. Which quantity D. Sideleau fhowed, was not fufficient to fupply the rivers; for that thofe of England, Ireland, and Spain, difcharge a greater quantity of water annually, than the rain, according to that experiment, is abie to fupply. Befides which, another oblervation was made by them at the fame time, viz. that the quantity of water raifed in vapour, one year with another, amounted to about thirtytwo inches, which is thirteen more than falls in rain : a plain indication that the water of fountains is not fupplied by rain and melted fnow.

Thus the true caufe of the origin of fountains remained undifcovered, till Dr Halley, in making his celeftial obfervations upon the tops of the mountains at St Helena, about 800 yards above the level of the fea, found, that the quantity of vapour which fell there (even when the flky was clear) was fo great, that it yery much impeded his obfervations, by covering his glaffes with water every half quarter of an hour; and upon that he attempted to determine by experiment the quantity of vapour exhaled from the furface of the fea, as far las it rifes from heat, in order to try whether that might be a fufficient fupply for the water continually difcharged by fountains. The procefs of his experiment was as follows: He took a veffel of water falted to the fame degree with that of fea water, in which he placed a thermometer; and by means of a pan of coals brought the water to the fame degree of heat, which is obferved to be that of the air in our hotteft fummer ; this done, he fixed the veffel of water with the thermometer in it to one end of a pair of fcales, and exactly counterpoifed 'it with weights on the other: then, at the end of two hours, he found, by the alteration made in the weight of the veffel, that abcut a fixtieth part of an inch of the depth of the water was gone off in vapour; and therefore, in twelve hours, one.tenth of an inch would have gone off. Now this accurate obferver allows the Mediterranean Sea to be forty degrees long, and four broad, (the broader parts compenfating for the narrower, fo that its whole furface is I 60 (quare degrees) ; which, according to the experiment, muft yield at leaft \(5,280,000,000\) tons of water : In which account no regard is had to the wind and the agitation of the furface of the fea, botlı which undoubtedly promote the evaporation.
It remained now to compare this quantity of water with that which is daily conveyed into the fame fea by the rivers. The only way to do which was to compare them with fome known river ; and accordingly he takes. his computation from the river Thames ; and, to avoid all objections, makes allowances, probably greater than what were abfolutely neceffary.

The Mediterranean receives the following confiderable rivers, viz. the Iberus, the Rhone, the Tyber, the Po, the Danube, the Niefter, the Boryithenes, the T'anais, and the Nile. Each of thefe he fuppofes to bring down ten times as much water as the Thames, whereby he allows for fmaller rivers which fall into the fame fea.

The Thames, then, he finds by menfuration to difcharge about \(20,300,000\) tons of water a-day. If therefore the above-faid nine rivers yield ten times as much water as the Thames doth, it will follow, that all of them together yield but 1827 millions of tons in a day, which is but little more than one-third of what is proved to be raifed in vapour out of the Mediterranean in the fame time. We have therefore from hence a fource abundantly fufficient for the fupply of fountains.

Now having found that the vapour exhaled from the fea is a fufficient fupply for the fountains, he proceeds in the next place to confider the manner in which they are raifed; and how they are condenfed into water again, and conveyed to the fources of fprings.

In order to this he confiders, that if an atom of water was expanded into a fhell or bubble, fo as to be ten times as big in diameter as when it was water, that atom would become fpecifically lighter than air; and therefore would rife fo long as the warmth which firt feparated it from the furface of the water fhould conti-i nue to diftend it to the fame degree; and confequently, that vapours may be raifed from the furface of the feain that manner, till they arrive at a certain height in the atmofphere, at which they find air of equal fpecific gra* vity with themfelves. Here they will float till, being condenfed by cold, they become fpecifically heavier than the air, and fall down in dew; or being driven by the winds againtt the fides of mountains (many of which: far furpafs the ufual height to which the vapours would of themfelves afcend), are compelled by the ftream of the air to mount up with it to the tops of them; where being condenfed into water, they prefently precipitate, and gleeting down by the crannies of the ftones, part of them enters into the caverns of the hills; which be-ing once filled, all the overplus of water that comes thither runs over by the lowelt place, and breaking out by the fides of the hills forms fingle fprings. Many of thefe running down by the valleys between the ridges of the hills, and coming to unite, form little rivulets or brooks:' many of thefe again meeting in one common valley, and gaining the plain ground, being grown lefs rapid, become a river; and many of thefe being united in one common chaunel, make fuch ftreams as the Rhine and the Danube ; which latter, he oblerves, one would hardly think to be a collection of water condenfed out of vapour, unlefs we confider how valt a tract of ground that river drains, and that it is the fum of all thofe fprinys which break out on the fouth fide of the Carpathian mountains, and on the north fide of the immenfe ridgo of the Alps, which is one continued chain of mountains from Switzerland to the Black Sea.

Thus one part of the vapours which are blown on the land is returned by the rivers into the fea from: whence it came. Another part falls into the fea before it reaches the land; and this is the reafon why the rivers do not return fo much water into the Mediterra. nean as is raifed is vapour. A third part falls on the low lands, where it affords nourifhment to plants; yet it does not relt there, but is again exhaled in vapour by the action of the fun, and is either carried by the winds to the fea to fall in rain or dew there, or elfe to the mountains to become the fources of fprings.

However, it is not to be fuppofed that all fountains are owing to one and the fame caufe; but that fome proceed from rain and melted fnow, which, fubfiding
through

\section*{\(S\) M R}

Sprinz.
through the furface of the earth, makes its way into certain cavities, and thence iffues out in the form of fprings ; becaufe the waters of feveral are found to in. creafe and diminifh in proportion to the rain which falls: that others again, efpecially fuch as are falt, and fpring near the fea-flore, owe their onigin to fea-water percolated through the earth; and fome to both thefe caufes: though withont doubt moft of them, and efpecially fuch as fpring near the tops of high mountains, receive their waters from vapours, as before explained.

This reafoning of Dr Halley's is confirmed by more recent obfervations and difcoveries. It is now found, that thou?h water is a tolerable conductor of the electric fluid, dry earth is an electric per fe, confequently the dry land muft always be in an electrified ftate compared with the ocean, unlefs in fuch particuler cafes as are mentioned under the article EarthQuake, \(\mathrm{n}^{\circ} 82\). It is alfo well known, that fuch bodies as are in an electrified ftate, whether flus or minus, will attract vapour, or other light fubftarices that come near them. Hence the vaporirs that are raifed from the ocean mutt neceffarily have a tendency to approach the land in great quantity, even without the affiftance of the wind, thougli this laft muft undoubtedly contribute greatly towards the fame purpofe, as Dr Halley juftly obferves. In like manner, the higher grounds are al. ways in a more electrified ftate than the lower ones: and hence the vapours having once left the ocean and approached the flore, are attracted by the hi \(h\) mountains, of which Mr Pennant gives an inftance in Snowdon. Hence we may fee the reafon why fprings are fo common in the neighbourhood of mountains, they being fo advantageonfly formed in every refpect for collecting and condenfing the vapours into water.

The heat of fprings is generally the fame with the mean temperature of the atmofphere. The mean temperature of the fouth of England is \(4^{8 \circ}\); in Scotland, near Edinburgh, it is \(45^{\circ}\); in the north of Ireland it is \(48^{\circ}\), and on the fouth coaft about \(51^{\circ}\). At Upfal, in Sweden, it is \(43^{\circ}\), and in Paris \(53^{\circ}\). According to accurate experiments made by eminent philofophers, the heat of the fprings in thefe different countries correfponds with the medium temperature. We have not heard that fimilar experiments have been made in other countries, or we fhould have been careful to collect them. We do not, however, doubt but they have been made in moft countries of Europe; yet we fufpect little attention has been paid to this fubject within the tropical regions.

Though this coincidence of the heat of fprings with the mean temperature of the climate where they flow, feems to be a general fact, yet it admits of many exceptions. In many parts of the world there are fprings which not only exceed the mean temperature, but even the ftrongeft meridian heat ever known in the torrid re gions. The following table will give a diftinct notion of the degrees of heat which different fprings have beeri found to poffefs, according to the experiments of philofophers. It is neceffary to remark, that experiments made upon the fame fprings, made by different perfons, vary a little from one another, which nay be owing to many accidents eafily accourted for. Where this is the cafe, we fhall mention both the loweft and higheft degree of heat which has been afcribed to the fame fring, according to Fahrenheit's thermometer.

\section*{Buxton,} Matlock, Bath, Aix-la.Chapelle, Barege, Pifa, Caroline baths in Bohemia, Iccland,

\section*{S}
springs.
St Vincent's or the hot well, Gentleman's bath, King's bath, In cold countries, where congelation takes place, the heat of the earth is confderably above the freezing point, and continues fo throush the whole year. From experiments that have been made in mines and deep pits, it appears that this heat is uniform and Itationary at a certain depth. 13ut as the heat of thefe fprings far exceeds the conmon heat of the internal parts of the earth, it mult be occafioned by caufes peculiar to certain places; but what thefe caufes are it is no eafy matter to determine. We are certain, indeed, that hot fprings receive their heat from fome lubterranean caufe; but it is a matter of difficulty to inveftigate how this heat is produced and preferved. Theories, however, have been formed on this fubject. 'The fubterranean heat has been afcribed to the electrical fluid, and to a great body of fire in the centre of the earth: But we fufpect that the nature of the electrical fluid and its effects are not fufficiently uaderfood. As to the fuppofition that the heat of fprings is owing to a central fire, it is too hypothetical to require any refutation. From what then does this heat originate, and whence is the fuel which has produced it for fo many ages? To enable us to anfwer thefe queftions with plecifion, more intormation is neceffary than we have hitherto obtained refpecting the flructure of the internal parts of the earth. It is peculiarly requifite that we fhonld be made acquainted with the foffils which are moft common in thote places where hot fprings abound. We fhould then perhaps difcover that hot íprings always pafs thro \({ }^{*}\) bodies of a comburtible nature. - It is well known to chemifts, that when water is mixed with the vitriolic acid, a degree of heat is procluced fuperior to that of boiling water. It is alio an eftablifhed fact, that when water meets with pyrites, that is, a mixture of fulphun and iron, a violent inflammation takes place. If, there fore, we could prove that thefe materials exift in the ftrata from which hot fprings are derived, we fhould be enabled to give a fatisfactory acconnt of this curious phenomenon. As fome apology for this fuppofition, we may: add, that moft of the hot fprings mentioned above have been found by analyfis to be impregnated with fulphur, and fome of them with iron. It muft, however, be acknowledged, that the hot fprings of Iceland, which are Germat \(112^{\circ}\), the heat of boiling water, according to an accurate and \(S w^{\circ}\) analyfis of their contents by the ingenious Dr Black, zerland were neither found to contain iron nor fulphur. It will therefore, perhaps, be neceffary that we fould wait with patience, and continue to colleet facts, till the feiences of chemiftry and mineralogy mall be fo far advanced as to enable us to form a permanent theory or this fubject.

Springs are of different kinds. Some are peremial,

\section*{S P U}
or continue to flow during the whole year ; others flow only during the rainy feafon; fome ebb and flow. At Torbay there is one of this kind, which ebbs and flows five or fix inches every hour. There is another near Corifo in Italy, which ebbed and flowed three times aday in the time of Pliny, and continues to do ftill. A fpring near Henly fometimes flows for two years together, and then dries up for an equal period. The caufe of this is explained under the article Hydrostatics, \(n^{\circ} 26\). For the ingredients found in fprings, fee Mineral Waters, and Water.

Spring, in mechanics, denotes a thin piece of tempered fteel, or other elaftic fubftance, which beirig wound up ferves to put machines in motion by its elafticity, or endeavours to unbend itfelf; fuch is the fpring of a watch, clock, or the like.

Spring, Ver, in cofmography, denotes one of the feafons of the year ; commencing, in the northern parts of the world, on the day the fun enters the firft degree of Arics, which is about the 1oth day of March, and ending when the fun leaves Gemini ; or, more ftrictly and generally, the fpring begins on the day when the diftance of the fun's meridian altitude from the zenith, being on the increafe, is at a medium between the greateft and leaft. The end of the fpring coincides with the beginning of fummer. See Summer.

Spring-Tide. See Astronomy-Index, and Tide.
Burning Springs. See Burning-Springs.
Springer, or Spring-Bok, in zoology. See Capra.
SPRIT, a fmall boom or pole which croffes the fail of a boat diagonally, from the madt to the upper hindmoft corner of the fail, which it is ufed to extend and elevate ; the lower end of the fprit refts in a fort of wreath or collar called the fmotter, which encircles the mat in that place.

SPRITSAIL. See Sail and Ship.
spritsail-Topfail. See Sail and Ship.
SPRUCE-tree. See Pinus.
SPRUCE-Beer, a cheap and wholefome liquor, which is thus made : Take of water 16 gallons, and boil the half of it. Put the water thus boiled, while in full heat, to the referved cold part, which fhould be previoufly put into a barrel or other veffel ; then add 16 pounds of treacle or molaffes, with a few table fpoonfuls of the effence of fpruce, ftirring the whole well together.; add half a pint of yeaft, and keep it in a temperate fituation, with the bung hole open, for two days, till the fermentation be abated. Then clofe it up or bottle it off, and it will be fit for being drunk in a few days afterwards. In North America, and perhaps in other countries, where the black and white ípruce-firs abound, inftead of adding the effence of the fpruce at the fame time with the molaffes, they make a decoction of the leaves and fmall branches of thefe trees, and find the liquor equally good. It is a powerful antifcorbutic, and may prove very ufeful in long fea voyages.

SPUNGE, or Sponge. See Spongia.
SPUNGING, in gunnery, the cleaning of the infide of a gun with a fpunge, in order to prevent any fparks of fire from remaining in it, which would endanger the life of him that fhould load it again.

SPUN-YARN, among: failors, is a kind of line made from rope yarn, and, ufed for: feizing or faltening things together.
:Vol. XVII. Part II.

\section*{SPUNK, in botany. See Boletus.}

SPUR, a piece of metal confifting of two branches encompaffing a horfeman's heel, and a rowel in form of a ftar, advancing out behind to prick the horfe.

Splir-Winged Water Hen. See Parra.
SPURGE, in botany. See Euphorbia.
Spurgr-Laurel. See Daphne.
SPURREY, in botany. See Spergula.
SPY, a perfon hired to watch the actions, motions, \&c. of another ; particularly what paffes in a camp. When a fpy is difcovered, he is hanged immediately.

SQUADRON, in military affairs, denotes a body of horfe whofe number of men is not fixed; but is ufually from 100 to 200.
SQUADRON of Ships, either implies a detachment of Thips employed on any particular expedition, or the third part of a naval armament.

SQUADS, in a military fenfe, are certain divifrons of a company into fo many fquads, generally into thrce or four. The ufe of forming companies into as many fquads of infpection as it las ferjeants and corporals, is proved by thofe regiments who have practifed that method; as by it the irregularity of the foldiers is confiderably reftrained, their drefs improved, and tlie difcipline of the regiment in general moft remarkably forwarded. Every officer fhould have a roll of his company by fquads.

SQUALL, à fudden and violent blaft of wind, ufually occafioned by the interruption and reverberation of the wind from high mountains. Thefe are very frequent in the Mediterranean, particularly that part of it which is known by the name of the Levant, as produced by the repulfion and new direction which the wind meets with in its paffage between the various inlands of the Archipelago.

SQUALUS, Shark, in ichtlyyology; a genus arranged by Linnrus under the clafs of amphibia, and the order of nantes, but by Gmelin referred to the clafs of pifces, and order of chondropterygzii. The head is obtufe; on the fides of the neck there are from 4 to 7 femilunar fpiracles. The eyes are oblong, vertical, half covered, and before the foramen temporale. The mouth is fituated in the anterior and lower part of the head, and is armed with feveral rows of teeth, which are ferrated, acute, partly moveable and partly fixed, and unequal in form. The body is oblong, tapering and rough, with very tender prickles. The ventral fins are much lefs than the pectoral, and are fituated round the anus and genitals. '1 here are 32 fpecies; the ifabella canicula or greater dog fifh ; catulus or fmaller dog-fifh; ftellaris; galeus or tope ; muftelus or fmooth hound ; cirratus; barbatus or barbu; tigrinus or tigre; A fricanus or galonné ; ocellatus or oeillé ; zygæna or balance-fifh; tiburo or pantoufier of Brouffonet; grifeus or srifet; vulpes or fea-fox ; longicaudus ; glaucus or blue fhark; cornubius, porbeagle, or beaumaris-fhark; cinereus or perlon; maximus; carcliariàs or white hark; prillis or fcie; fpinofus or bouelé; acanthias or picked dog fifh; fernandinus; fpinax or fagre; fquamofus or ecailleux ; centrina or humantin; indicus; Americanus or liche; fquatina or angel fofh; maffafa; and kumal. The following are the molt remarkable :
r. The ifabella has a wrinkly fpotted fikin, and the anterior dorfal fin is perpendicular to the abdominal fins. The body is fomewhat flat; the head firort, large, and

4 X
obtufe.

\section*{\(S \quad Q \quad\left[\begin{array}{lll}714\end{array}\right] \quad S \quad Q \quad U\)}
squalus. obtufe. The teeth are difpofed in fix rows, compreffed, fhort, and triangular, having a notch on each fide of their bafes. The eyes are funk; the iris is of a copper colour, and the pupil is black and oblong. The fins of the back are almoft fquare; the candal fin is divided into two lobes, and the lateral line is parallel to the back. The upper part of the body is of a reddifh afhcolour, with blackifh fpots difpofed irregularly. The under part is of a dirty white hue. This fpecies is found near New Zealand, and is about \(2 \frac{1}{2}\) feet long.
2. Canicula, greater dog-fifh, or fpotted hark, is diftinguifhed by large noftrils, which are covered by a lobe and worm-fhaped flap, or by the pofition of the anal fin, which is at an equal diflance from the anus and tail. The body is fpotted ; the head is fmall, with a fhort fnout; the eyes are oblong; the iris whitifh; the mouth is large and oblong, armed with three rows of teeth; the tongue is cartilacinous; the anus is before the middle of the body ; the firf dorfal fin is behind the ventral fins; the other, which is lefs, is almoft oppofite the anal fin ; the caudal fin is narrow and marginated. 'I'his fpecies is found' in almoft every fea, ' is about four feet long, extremely voracious, generally feeding on fifhes, and is long lived. 'The Rkin, which is fpotted like a leopard's, is ufed when dried for various purpofes.
3. Catulus, fmaller dog fifh, has a large head; the pupil of the eyes is black; the iris white; the fnout is of a bright hue ; the mouth, which is large, is fituated between the noftrils, and is armed with four rows of teeth, ferrated with three points bent inwards; thofe in the middle between the two mandibles are longer than the reft. The tongue is broad and fmooth; the fpiracles are five; the back is tapering and yellowifh; the fides are fomewhat compreffed; the tail longer than the body, and the caudal fin is narrow and marginated; the anterior anal and dorfal fins are behind the ventral ; the pofterior dorfal fin is oppofite to the anal. It inhabits the Mediterranean, Northern, and Indian Ocean, and is two or three feet long.
4. Stellaris, or greater cat fifh. The head is marked with points ; the abdominal fins are united and fharp at the apex; the dorfal fins extend almoft to the tail ; the fkin is reddifh, marked with black fpots of different fizes, and is of a dirty afh colour below. It is from two to fix feet long; refembles the canicula, but diftinguifhed by larger and fewer fots, by a fnout fomewhat longer, a tail fomewhat fhorter, and noftrils almoft fhut. It brings forth 19 or 20 young at a time. It inhabits the Eurnpean feas, living chiefly on fhell fifh, mollufcæ, and other fmall fifhes. The dorfal fins are equal ; the anterior one being behind the middle of the body, and the pofterior one being a little behind the anal.
5. Tigrinus, or tigre, is about 15 feet long; the body is long, of unequal thicknefs, black, interfperfed with white fripes and fpots, irregularly and tranfverfely.The head is large ; the mouth low and tranifverfe, the upper jaw having two curls; the upper lip is thick and prominent ; there are five fpirácles on each fide, the two laft being united fo as to give the appearance only of four; the mandibles are armed with very fmall pointed teeth ; the tongue is fhort and thick; the cyes fmall and oblong; the pupil azure coloured ; the iris black. The abdomen is broad ; the pectoral fins are broad, and rounded at the extremity. The anterior dorfal is oppo.
fite to the ventral fins, and the pofterior dorfal fin to the anal. The tail is compreffed on both fides, and the fin which terminates it is hollow. The tigrinus is found in the Indian Ocean, and lives chiefly on fhell fifh. See Plate CCCCLXXVI. fig. 1.
7. Zygœna, marteau, or balance-fifh, is frequently fix feet long, and weighs 500 lbs . The head is elongated on each fide; the fore part is bent back, and convex both above and below. At the extremities of the elongated part are the eyes, which are large, prominent, and directed downwards; the iris is of a golden colour ; the mouth is arched, and near the beginning of the trunk. It has a horrible appearance from the teeth, which are arranged in three or four rows, and are broad, pointed, and ferrated on both fides. The tongue is thick, broad, and like a man's. The trunk is long and tapering : the fins are femicircular on the margin, and black at the bafis; the ventral fins are feparate; the anal and pofterior doifal fins are fmall; the anterior dorfal fin is large, and near the head; the caudal is long.This fpecies inhabits the Mediterranean Sea and the Indian Ocean. It is one of the mort voracious of the whole tribe. See fig. 2.
8. Vulpes, o: fea-fox, is moft remarkable for the great length of its tail, the body being about feven feet and the tail fix feet long. The head is fhort and conical ; the eyes are large; the jaws are armed in a dreadful manner with three rows of triangular, compreffed, and pointed teeth ; the tongue is blunt ; the lateral line is ftraight. The anterior dorfal fin is placed about the middle of the back ; the pofterior, which confifts of two pointed lobes, is oppofite to the anal fin; the ventral fins are very near one another; the anal is acuminated; the inferior lobe of the tail is about a foot long; the upper, which is fhaped like a fcythe, is five times longer. This fpecies inhabits the Mediterranean, the coalt of Scotland and England. It is covered with fmall fcales; its back is afh-coloured, belly whitifh. It is extremely voracious. The ancients fyled this fing \(\alpha \times \omega+n \xi\), and vüpes, from its fuppofed cunning. They believed, that when it had the misfortune to have taken a bait, it fwallowed the hook till it got at the cord, which it bit off, and fo efcaped.
9. Glaucus, or blue fhark, is about feven feet longThe colour of the back is a fine blue; the belly a filvery white; the head is flat; the eyes fmall and roundif: the teeth are almoft triangular, elongated, and pointed, but not ferrated. The anus is very near the tail; the anterior dorfal fin is fituated before the ventral fins, about the middle of the body, and is almoft triangular; the pofterior dorfal fin is equal to the anal fin, and is placed nearer the tail ; the pectoral fins are large, long, and marginated; and the ventral are blue above and white below ; the caudal is blue, divided into two lobes, of which the fuperior is much longer than the inferior lobe. This fpecies is frequent in every fea, and is fierce, but not very deftructive in our feas.
10. The maximus, bafking fhark, or the fun-fifh of the Irifh. This fpecies has been long. known to the inhabitants of the fouth and weft of Ireland and Scotland; and thofe of Caernarvonfhire and Anglefea; but having never been confidered in any other than a commercial view, is defcribed by no Englifh writer except Mr Pennant ; and, what is worfe, miftaken for and confounded with the luna of Rondeletius, the fame

\section*{\(S \subset U \quad[915] \quad S \subset U\)}
(ualus, that our Englifh writers call the fun-fifh. The Irifh and Welfh give it the fame name, from its lying as if to fun itfelf on the furface of the water; and for the fame reafon Mr Pennant calls it the bafking fhark. It was long taken for a fpecies of whale, tull Mr Pennant pointed out the bronchial orifices on the fides, and the perpendicular fite of the tail. Thefe are migratory fifh, or at leaft it is but in a certain number of years that they are feen in multitudes on the Welih fens, though in moft fummers a fingle, and perhaps a ftrayed fifh appears. They inhabit the northern feas, even as high as the arctic circle. They vifited the bays of Caernarvonfhire and Anglefea in vaft fhoals in the fummers of 1756 and a few fucceeding years, continuing there only the hot months; for they quitted the coaft about Michaelmas, as if cold weather was difagreeable to them. Some old people fay they recollect the fame fort of finh vifiting thefe feas in valt numbers about 40 sears ago. They appear in the Fith of Clyde, and among the Hebrides, in the month of June, in fmall droves of feven or eight, but oftener in pairs. They continue in thofe feas till the latter end of July, when they difappear.

They have nothing of the fierce and voracious nature of the fhark kind, and are fo tame as to fuffer themfelves to be ftroked; they generally lie motionlefs on the furface, commonly on their bellies, but fometimes, like tired fwimmers, on their backs. Their food feems to confit entirely of fea plants, no remains of fifh being ever difcovercd in the fomachs of numbers that were cut up, except fome green fuff, the half digetted, parts of algæ, and the like. Linnæus fays it feeds on medufe.
At certain times, they are feen fporting on the waves, and leaping with vaft agility feveral feet out of the water. They fwim very deliberately, with the dorfal fins above water. Their length is from three to twelve yards, and fometimes even longer. Their form is rather flender, like others of the fhark kind. The upper jaw is much longer than the lower, and blunt at the end. The tail is very large, and the upper part remarkably longer than the lower. The colour of the upper part of the body is a deep leaden ; the belly white. The fkin is rongh like flagreen, but lefs fo on the belly than the back. In the mouth, towards the throat, is a very fhort fort of whale-bone. The liver is of a great fize, but that of the female is the largeft, fome weigh above 1000 pounds, and yield a great quantity of pure and fweet oil, fit for lanps, and alfo much ufed to cure bruifes, burns, and rheumatic complaints. A large fifh has afforded to the captors a profit of 201 . They arc viviparous; a young one about a foot in length being found In the belly of a fih of this kind. The meafurements of one found dead on the fhore of Loch Ranza in the inle of Arran were as follow : The whole length, 27 feet 4 inches; firt dorfal fin, 3 feet; fecond, if foot; pectoral fin, 4 feet; ventral, 2 feet; the upper lobe of tile tail, 5 feet ; the lower, 3.

They will permit a boat to follow them, without accelerating their motion till it comes almoft within contact when a harponeer ftrikes his weapon into chem, as near to the gills as poffible. But they are often fo infenfible as not to move till the united Atrength of two men have forced in the harpoon deeper. As foon as
they perceive themfelves wounded, they fling up their tail and plunge headlong to the bottom; and frequently ccil the rope round them in their agonies, attempting to difengage the harpoon by rolling on the ground, for it is often found greatly bent. As foon as they difcover that their efforts are in vain, they fwim away with amazing rapidity, and with fuch violence, that there has been an infance of a veffel of 70 tons having been towed away againtt a frefh gale. They fometimes run off with 200 fathoms of line, and with two harpoons in them ; and will employ the fifhers for 12, and fomctimes for 24 hours, before they are fubdued. When killed, they are either hauled on fhore, or, if at a diffance from land, to the veffel's fide. The liver (the only ufeful part), is taken out, and melted into oil in kettles provided for that purpofe. A large fifh will yield eight barrels of oil, and two of worthlefs fediment.
11. Carcharias, requin, or white fhark, is often 30 feet long, and according to Gillius weighs 4000 pounds. The mouth of this filh is fometimes furnihed with a fix-fold row of teeth, flat, triangular, and exceedingly fharp at their edges, and finely ferrated. Mr Pennant had one rather more than an inch and a half long. Grew fays, that thofe in the jaws of a fhark two yards in length are not half an inch; fo that the fifh to which this tooth belonged muft have been fix yards long, provided the teeth and body keep pace in their growth.
This dreadful apparatus, when the fifh is in a tate Fig. 40 of repofe, lies quite flat in the mouth; but when he feizes his prey, he has power of erecting them by the help of a fet of mufcles that join them to the jaw. The mouth is placed far beneath; for which reafon thefe, as well as the reft of the kind, are faid to be obliged to turn en their backs to feize their prey; which is an oblervation as ancient as the days of Pliny. The eycs are large; the back broad, flat, and fhorter than that of other fharks. The tail is of a femilunar forin, but the upper part is longer than the lower. It has vaft ffrength in the tail, and can ftrike with great force ; fo that the failors inftantly cut it off with an axe as foon as they draw one on board. The pectoral fins ale very large, which enables it to fwin with great fwiftnels. The colour of the whole body and fius is a light afh. The ancients were acquainted with this fill; and Oppian gives a long and entertaining account of its capture. Their felh is fometimes eaten, but is efteemed coarfe and rank. -They are the dread of the failors in all hot climates, where they conftantly attend the fhips in expectation of what may drop over-board : a man that has that misfortune perifies without redemp. tion ; they have becn feen to dart at him like gudgeons at a worm. A matter of a Guinea fhip informed Mr Pennant, that a rage of fuicide prevailed among his new-bought Пaves, from a notion the unhappy creatures had, that after death they flould be reftored again to their families, friends, and country. To convince them at leaft that they fhould not reanimate their bodies, he orderd one of their corpres to be tied by the heels. to a rope and lowered into the fea; and though it was drawn up again as faft as the united force of the crew could be exerted, yet in that fhort fpace the fharks had devoured every part but the feet, which were fecured at the end of the cord.

Swimmers very often perifh by them; fometimes \(4 \times 2\)
they

Squalu:.

\section*{\(S\) Q U}

This is the fifh which connects the genus of rays and Squato Tharks, partaking fomething of the character of both; yet is an exception to each in the fituation of the mouth, which is placed at the extremity of the head. It is a fifh not unfrequent on moft of our coafts, where it prowls about for prey like others of the kind. It is extremely voracious; and, like the ray, feeds on flounders and flat fifh, which keep at the bottom of the water. It is extremely fierce, and dangerous to be approached. Mr Pennant mentions a fifherman whofe leg. was terribly torn by a large one of this fpecies, which lay within his nets in fhallow water, and which he went to lay hold of incautioully. The afpect of thefe, as well as the reft of the genus, have much malignity in them: their eyes are oblong, and placed lengthwife in their head, funk in it, and overhung by the fkin, and feem fuller of malevolence than fire. Their flkin is very rourg ; the ancients made ufe of it to polifh wood and ivory, as we do at prefent that of the greater dog-fifh. The flef is now bit little efteemed ou account of its coarfenefs and ranknefs; yet Archeftratus (as quoted by Athenæus, P. 3 9.), fpeaking of the fifh of Miletus, gives this the firf place, in refpect to delicacy, of the whole cartilaginous tribe. They grow to a great fize; being fometimes near an hundred weight.

Sharks are feldom deffructive in the temperate regions; it is in the torrid zone that their ravages are morl frequent. In the Weft. Indies accidents happen from them almoft civery day.
"During the American war in 1780 , while the Pal- Mofeleg a las frigate was lying in Kington harbour, a young Trepiciab North American jumped overboard one evening to make Dije.ficso his efcape, and perifhed by a fhark in a fhocking manner.
"He had been captured in a fmall veffel, loft all his property, and was detained by compulion in the \(\mathrm{En}_{\mathrm{n}}\) glifh navy, to ferve in a depredatory war again!t his country. But he, animated with that firit which pervaded every bofom in America, refolved, as foon as he arrived at fome port, to releafe himfelf from the mortifying ftate of employing his life againft his country, which, as he faid when dying, he was happy to lay down, as he could not employ it againft her enemies.
"He plunged into the water; the Pallas was a quarter. of a mile from the fhore. A fhark perceived him, and followed him, very quietly, till he came to a flate of reft, near the flhore : where, as he was hanging by a rope, that moored a veffel to a wharf, fcarcely out of his depth, the fhark feized his right leg, and fripped the flefh entirely away from the bones, and took the toot off at the ancle. He till kept his hold, and called to the people in the veffel near him, who were flanding on the deck and faw the affair. The flark then feized his other leg, which the man by his ftruggling difengaged from his teeth, but with the flefh cut through down to the bone, into a multitude of narrow nips. The people in the veffel threw billets of wood into the water, and frightened the fhark away. The young man was brought on fhore. Dr Mofeley was called to him ; but he had, loft fo much blood before any affiftance could be given him, that he expired before the mangled limbs could be taken off.
"A few weeks before this accident happened, a flark, of 12 feet in length, was caught in the harbour; and

Squalus.
ones, which always retreat into their §omachs, in time Squamaria of danger.
"That digeflion is not performed by heat in finh, is his ftomach. The fcalp, and flefh of the face, were macerated to a foft pulpy fubftance ; which, on being touched, feparated entirely from the bones. The bones were fomewhat foftened, and the futures loofened."
The following extraordinary inftance of intrepidity and friendfhip is well worth recording. It is given on the authority of Mr Hughes, who publifhed a natural hiftory of Barbadoes. About the latter end of Queen Anne's wars, captain John Beanis, commander ot the York Merchant, arrived at Barbadoes from England. Having difembarked the laft part of his lading, which was coals, the failors, who had been employed in that dirty work, ventured into the fea to wafh themfelves; there they had not been long before one on board efpied a large fhark making toward them, and gave them notice of their danger; upon which they fwam back, and all reached the boat except one : him the monfter overtook almof within reach of the oars, and griping him by the fmall of his back, foon cut him afunder, and as foon fwallowed the lower part of his body'; the remaining part was taken up and carried on board, where a comrade of his was, whofe friendmip with the deceafed had been long diftinguifhed by a reciprocal difcharge of all fuch endearing offices as implied an union and fympathy of fouls. When he faw the fevered trunk of his friend, it was with an horror and emotion too great for words to paint. During this affecting fcene, the infatiate fhark was feen traverfing the bloody furface in fearch of the remainder of his prey; the reft of the crew thought themfelves happy in being on board, he alone unhappy, that he was not within reach of the deftroyer. Fired at the fight, and vowing that he would make the devourer difgorge, or be fwallowed himfelf in the fame grave, he plunges into the deep, armed with a fharp-pointed knife. The fhark no fooner faw him, but he made furioufly toward him ; both equally eager, the one of his prey, the other of sevenge. The moment the fhark opened his rapacious jaws, his adverfary dexteroufly diving, and gra!pins him with his left hand fomewhat below the upper fins, fucceiffully employed his knife in his right hand, giving him repeated flabs in the belly; the enraged mark, after many unavailing efforts, finding himfelf overmatched in his own element, endeavoured to difengage himfelf, fometimes plunging to the bottom, then mad with pain, rearing his uncouth form, now flained with his own ffreaming blood, above the foaming waves. The crews of the furrounding veffels faw the unequal combat, uncertain from which of the combatants the ftreams of blood iffued; till at length the fhark, much weakened by the lofs of blood, made toward thie fhore, and with him his conqueror ; who, flufhed with an affurance of victory, pufhed his foe with redoubled ardour, and, by the help of an ebbing tide, dragged him on thore, ripped up his bowels, and united and buried the fevered carcafe of his friend "
" It is evident (fays Dr Mofeley, to whofe valuable work we are indebted tor the ftory of the American related above), that digeftion in thefe animals is not performed by trituration, nor by the mufcular action of the flomach; though nature has furnifhed them with a ftomach of wonderful force and thicknefs, and far exceeding that of any other creature. Whatever their force of digettion is, it has no cfiect upon their young
equally evident. Being on the Banks of Newfound. land in Anoult 1782, I opened many cod fifh, and ripped up their ftomachs jutt as they came alive out of the water ; in which were generally found fmall oylters, mufcles, cockles, and crabs, as well as fmall fifhes of their own and other fpecies. 'The coldnefs of the ftomach of thefe fifhes is far greater than the temperature of the water out of which they are taken; or of any other part of the fifh, or of any other fubltance of ani. mated nature I ever felt. On wrapping one of them round my hand, immediately on being taken out of the fifh, it caufed fo much aching and numbnefs that I could not endure it long."

SQUAMARLA, in botany. See Lathrea.
SQUAMOUS, in anatomy, a name given to the fpurious or falfe futures of the fikull, becaufe compo. fed of fquamr, or fcales like thofe of fifhes.

SQUARE, in geometry, a quadrilateral fioure both equilateral and equiangular. See Geometry.

Squarb-Rout. See Algebra, Part I. Chap. iv. and Arithmetic, \(n^{\circ} 33\). and 34 .

Hollorv SQuare, in the military art, a body of foot drawn up with an empty face in the middle, for the colours, drums, and baggage, faced and covered by the pikes every way, to keep off the horfe.

Souare, among inechanics, an inftrument confifting of two rules or branches, faftened perpendicularly at one end of their extremities, lo as to form a right angle. It is of great ufe in the defcription and menfuration of right angles, ad laying down perpendiculars.

Square-Rigged, an cpithet applied to a fhip whofe yards are very long. It is alfo ufed in contradiftinction to all veffels whofe fails are extended by ftays or lateen-yards, or by booms and gaffs; the ufual fituátion of which is nearly in the plane of the keel; and hence,
Souare-Scit, is a fail extended to a yard which hangs parallel to the horizon, as dillinguithed from the other fails which are extended by booms and flays placed ohliquely. This fail is only ufed in fair winds, or to fcud under in a tempeft.: In the former cafe, it is furnifhed with a large additional part called the bonnet, which is then attached to its bottom, and removed when it is neceffary to scud. .: See Scudding.
SQUATINA. See Sgualus.
SQUILI, in botimy. See Scilla.

Stachys,

Blackf.
Comment
vol. iv.
p. 593.
ctmon of James I.; and being therefore of a temporary nature, ought to have expired with the mifchief which it meant to remedy. For, in point of folid and fubftantial juftice, it cannot be faid that the mode of killing, whether by ftabbing, ftrangling, or fhooting, can either extenuate or enhance the guilt; unlefs where, as in the cafe of poifoning, it carries with it internal evidence of cool and deliberate malice. But the benignity of the law hath conftrued the ftatute fo favourably in behalf of the fubject, and fo ftrictly when againt him, that the offence of flabbing now Itands almoft upon the fame footing as it did at the common law. Thus, (not to repeat the cafes mentioned under Manslaughter, of ftabbing an adulterefs, \&c. which are barely manflaughter, as at common law), in the conftruction of this ftatute it hath been doubted, whether, if the deceafed had ftruck at all before the mortal blow given, this does not take it ont of the flatute, tho' in the preceding quarrel the ftabber had given the firlt blow ; and it feems to be the better opinion, that this is not within the flatute. Allo it hath been refolved, that the killing a man, by throwing a hammer or other weapon, is not within the ftatute; and whether a fhot with a piftol be fo or not is doubted. But if the party flain had a cudgel in his hand, or had thrown a pot or a bottle, or difcharged a piftol at the party ftabbing, this is a fuff. cient reafon for having a weapon drawn on his fide within the words of the ftatute.

STACHYS, in botany: A genus of plants belonging to the clafs of didynamia, and order of aymnofpermia; and in the natural fyltem arranged under the 42 d order, Verticillata. 'I he upper lip of the corolla is arched; the lower lip reflexed, and the larger intermediate lacinia is marginated. The ftamina, after fhedding the farina, are bent towards the fides. There are 17 fpe. cies, the fylvatica, paluftris, alpina, germanica, lanata, eretica, glutinofa, orientalis, palæftina, maitima, xthiopica, hirta, canarionfis, recta, annua, and arvenfis. Four only are natives of Britain.
I. Sylvatica, hedge-nettle. The plant is hairy all over, erect, a yard high, and branched; the hairs are pointed. The flowers are of a deep red colour, fix or eight in a whirl, which terminates in a long fpike deftitute of leaves. The leaves are heart.fhaped, and grow on footfalks. The whole plant has a ftrong fetid fmell. It grows commonly in woods and fhady places, and flowers in July or Auguft. 2. Palufris, clown's allheal. The roots are white and tuberous. The ftalk is branched at the bottom, and two or three feet high. The flowers are red or purple, from fix to ten in a whirl, ending in a long fpike. The leaves are feffile, narrow, pointed, and in part furrounding the ftem. This plant has a fetid fmell and bitter tafte, and is reckoned a good vulnerary. It grows on the fides of rivers and lakes, in low moit grounds, and fometimes in com-fields. 3. Germanica, bafe hore-hound. The ftem is downy, and about two feet high. The leaves are white, downy, wrinkled, and indented. The flowers are white; purplifh within, and grow in multiflorous whirls. It grows in England. 4. Arvenfis, corn-ftachys, petty ironwort, or all-heal. The ftaik is 10 or 12 inches high, fquare, branched, and hairy. The leaves are heartfhaped, obtufe, bluntly ferrated, and lefs hairy. 'I he calyx is hairy and feffile, and deeply divided into five acute dents of equal length. The flowers are flefh-co-

718 ]
]
loured, and grow from three to fix in a whirl. The stadiu lower lip is trifid ; the middle fegment fpotted with red, Stadthe but not emarginated according to the character of the genus. It is frequent in corn-fields, and grows from June to Augult.

STADIUM, an ancient Greck long meafure, containing 125 geometrical paces, or 625 tioman feet, correfponding to our furlong. The word is faid to be formed from the Greek word savis "a ftation," or " \(s 5^{\prime} \mu t\) "to ftand," becaufe it is reported that Hercules having run a ftadium at one breath, ftood ftill at the end of it. The Greeks ufually meafured diftances by ftadia, which they called seasiaruos. Stadium alfo fignified the courfe on which their races were run.

STADTHOLDER, the principal magiftrate or governor of the Seven United Provinces. This offace is now abolifhed by the republican influence of Fiance; but as the prince of Orange is in alliance with this country, our readers will probably not be ill pleafed with a fhort account of his feveral powers and claims. To render that account the more intellizible, we fhall trace the office of Stadtholder from its origin.

The Seven Provinces of the Low Countries were long governed by princes invefted with the fovereignty, though limited in their powers, and under various titles; as Counts of Holland, Dukes of Guelder, Bigop of Utrecht, \&c. When thefe countries fell to the princes of the houfe of Burgundy, and afterwards to thofe of Auftria, who had many other dominions, the abfence of the fovereign was fupplied by a ftadtholder or governor, vefted with very ample powers. Thefe ftadtholders or lieutenants had the adminiftration of the government, and prefided in the courts of juftice, whofe jurifdiction was not at that time confined merely to the trial of caufes, but extended to affairs of ftate. The ftadtholders fwore allegiance to the princes at their inauguration, jointly with the fates of the provinces they governed. They likewife took an oath to the ftates, by which they promifed to maintain their fundamental laws and privilegcs.

It was upon this footing that William the Firf, prince of Orange, was made governor and lieutenantgeneral of Holland, Zealand, and Utrecht, by Philip the Second, upon his leaving the Low Countries to go into Spain. The troubles beginning foon after, this prince found means to bring about an union, in 1576 , between Holland and Zealand; the ftates of which two provinces put into his hands, as far as was in their power, the fovereign authority (for fo long time as they fhould remain in war and under arms), upon the fane footing as Holland had intrulted him with in the year before. In 1581 the fame authority was again renew. ed to him by Hollaid, as it was foon after by Zealand likewife; and in 1584, teing already elected count of Holland, upon certain conditions he would have been formally invetted with the fovereignty, had not a wretch, hired and employed by the court of Spain, put an end to his life by a horrid affaffination.

In the preamble of the inftrunents by which the ftates in 1581 conferied the fovereign authority upon priuce William the Firft, we find thefe remarkable words, which are there fet down as fundamental rules : * That all republics and communities ought to preferve, maintain, and fortify themfelves by unanimity ; which being impoffible to be kept up always among fo
athold- many members, often ciffering in inclinations and fentiments, it is confequently neceffary that the governmeut fhould be placed in the hands of one fingle chief magiftrate." . Many good politicians, and the greateft part of the inhabitants of thefe provinces, have, fince the effablifhment of the republic, looked upon the fladtholderian government as an effential part of her conttitution ; nor has fhe been without a fladtholder but twice, that is to fay, from the end of 1650 to 1672 , and again from March 1702 till April 1747 . The provinces of Fritfland and Groningen, with Ommelands, have always had a ftadtholder without interruption: their inftructions, which are now no longer in förce, inay be feen in Aitzema ; but formerly the powers of the ftadtholder of thefe provinces were confined within narrower bounds, and till William the Fourth there was no fladtholder of the feven provinces together.
The ftadtholder cannot declare war nor make peace, but he has, in quality of captain-general of the union, the command in chief of all the forces of the ftate (A); and military perfons are obliged to obey him in every thing that concerns the fervice. He is not limited by initructions, but he has the important power of giving out orders for the march of troops, and the difpofition of all matters relative to them. Hie not only directs their marches, but p:ovides forthe garrifons, and changes them at pleafure. All military edicts and regulations come from lim alone; he conflitutes and authorizes the high council of war of the United Provinces, and, as captain. general of every province, difpofes of all military offices, as far as the rank of colonel inclufively. The higher pofts, fuch as thofe of velt-mai fhals, generals, lieutenant.generals, major-generals, are given by the Rates-general, who choofe the perfons recommended by his highnefs. He makes the governors, commandants, \&c. of towns and ftrong places of the republic, and of the barrier. The perfons nominated prefent their inAruments. of appointment to their high mightineffes, who provide them with commiffions. The ftates.general liave likewife great regard to the recommendation of the prince ftadtholder in the difpofition of thofe civil employments which are in their gift.
The power of the fladtholder as high-admiral, ex. tends to every thing that concerns the naval force of the republic, and to all the other affains that are here within the juriddiction of the admiralty. He prefides at thefe boards cither in perfon or by his reprefentatives; and as chief of them all in general, and of every one in particular, he has power to make their orders and infructions be obferved by themfelves and others. He beftows the pofts of lieutenant-admiral, vice-admiral, and rear-admiral, who command under him; and he makes likewife poit-captains.

The ftadtholder grants likewife letters of grace, pardon, and abolition, as well for the crime called Communia Delita, as for military offences. In Holland and Zealand. thefe letters are made out for crimes of the firlt
fort, in the name of the ftates, with the advice of his Stadthold. highnefs. In military offences he confults the high council of war, and upon the communia delicta he takes the advice of the courts of jultice, of the counfellors, committees of the provinces, of the council of ftate, and the tribunals of jnitice in the refpective towns, according to the nature of the cafe.

In the provinces of Holland and Zealand, the ftadtholder elects the magiftrates of the towns annually, out of a double number that are returned to him by the towns themfelves.
When any of thofe offices become vacant, which, at the time there was no governor, were in the difpofal of the ftates of Holland, or as formerly in that of the chamber of accountsy the ftadtholder has his choice of two, or, in fome cafes, of three candidates, named by their noble and great mightineffes. He choofes likewife the counfellors, infpectors of the dykes of Ryn.. land, Delfland, and Sclieeland, out of three perfons prefented to him by the boards of the counfellors infpectors; which boards are of very ancient eltablifh. ment in Holland.

His highnefs prefides in the courts of Holland, and in the courts of juftice of the other provinces; and his name is placed at the head of the proclamations and acts, called in Dutch Mandamenten, or Provifien van Fufitie. In Overyffel and in the province of Utrecht. the poffefors of fiefs hold of the prince fadtholder. He is fupreme curator of the univerfities of Guelder, Friefland, and Groningen ; grand forefter and grand veneur in Guelder, in Holland, and other places. In the province of Utrecht, his highnefs, by virtue of the regulation of 1674 , difpofes of the provofthips and other benefices which remain to the chapters, as alfo of the canonical prebends that fall in the months which were. formerly the papal months.

By the firlt article of the council of fate of the United Provinces, the ftadtliolder is the firt member of: it, and has a right of voting there, with an appointment. of 25,000 guilders a-year. He affists alfo as often as he thinks it for the fervice of the ftate, at the deliberations of the ftates-general, to make propofitions to them, and fometimes alfo at the conferences which the deputiesof their high mightineffes hold in their different com \(\downarrow\) mittees, in confequence of their ftanding orders. He likewife affilts at the affemblies of the fates of each particular province, and at that of the counfellors com.mittees. In. Guelder, Holland, and Utrecht, his high. nefs has a fhare of the fovereignty, as chief or prefident of the body of nobles; and in Zealand, where lie poffef. fes the marquifate of Veer and Flufhing, as firt noble. and reprefenting the whole nobility. - In his abfence he has in Zealand his reprefentatives, who have the firft place and the firt voice in all. the councils, and the firt of whom is always firft deputy from the province to the affembly of their high mightineffes.

In 1749 the prince fladtholder was created by the fates.
(A) In times of war, however, the ftates have always named deputies for the army, to accompany the fadtholders. in the field, and to ferve them as counfellors in all:their enterprifes, particularly in the roft important affairs, fuch as giving battle, or undertaking a fiege, \&c. This was always practifed till the acceffion of king: William the Third to the crown of Great Britain, and after his death was continued with regard to the generale in chief of the army of the republic. In 17.47 and 1.748 there were likewife deputies with the army, but witha more limited power.

\section*{\(S\) T A}

Stachclina fates.general, governor.general and fupreme dircetor of the Eaft and Weft India companies; dignitice which give him a great deal of authority and power, and which had never been conferred upon any of his predeceffors, nor have they hitherto been made hereditary. He has his reprefentatives in the feveral chambers of the company, and choofes their directors out of a nomination of three qualified perfons. The prince enjoyed this prelogative in Zealand from the time of his clevation to the fladtholderate.

The revenues of the ftadtholderate of the feven \(U\). nited Provinces are reckoned (including the 25,000 guilders which the prince enjoys annually as the firft member of the council of ftate, and what he has from the India company's dividends) to amount to 300,000 guilders \({ }^{\circ}\) year. As captain-general of the union, his ferene highnefs has 120,000 guilders fer annum, befides 24,000 from Friefland, and 12,000 from Groningen, in quality of captain-general of thofe provinces. In times of war the fate allows extraordinary fums to the captaingeneral for the expence of every campaisn.

To all thefe powers and privileges the prince of \(O\) range has a legal and conftitutional right ; but he has been divefted of them by a faction which feems determined to fell to the cruel and arbitrary republic of France that country which his anceftors redcemed from Auftrian flavery, at the hazard of lofing every thing dear to them but liberty and honour.

ST EHELINA, in botany: A genus of plants belonging to the clafs of fyngenefia, and order of polygamia requalis; and in the natural fyftem arranged under the 49th order, Compofite. The receptacle is palcaceous, the chaff being very fhort ; the pappus is branchy, and the antheræ caudated. There are eight fpecies, the gnaphaloides, dubia, arborefcens, fruticof, ilicifolia, corymbofa, chamæpeuce, and imbricata.

STAFF, an inftrument ordinarily ufed to reft on in walking. The faff is alfo frequently ufed as a kind of natural weapon both of offence and defence; and for fe veral other purpofes.

Staff, a light pole erected in different parts of a fhip, whereon to hoift and difplay the colours.

The principal of thefe is reared immediately over the ftern, to difplay the enfign; another is fixed on the bowfprit, to extend the jack ; three more arc crected at the three malt heads, or formed by their upper ends, to fhow the flag or pendant of the refpective fquadron or divifion to which the hlip is appropriated. See Ensign, Mast, Jack, and Pendant.

STAFF, in military matters, confifts of a quarter-mafter-general, adjutant-general, and majors of brigade. The ftaff properly exits only in time of war. See Quarter-Mafler General, \&c.

Regimental \(S_{T: A F F}\), confifts in the adjutant, quartermafter, chaplain, furgeon, \&c.

Staff, in mufic, five lines, on which, with the in. termediate fpaces, the notes of a fong or piece of mufic are marked.

Fore-Staff. Sce Fork-Staff.
STAFFA, one of the Hebrides or Weftern Iflands of Scotland, remarkable for its bafaltic pillars. - It was vifited by Sir Jofeph Banks, who communicated the following account of it to Mr Pennant.
" The little inland of Stana lies on the weft coall of

Mull, about three leagues north-eaft from Iona,-or Icolumbkill : its greateft length is about an Englifh mile, and its breadth about half \(a\) one. On the weft fide of the ifland is a frnall bay where boats generaily land; a little to the fouthward of which the firf appearance of pillars are to be obferved: they are fmall; and inftead of being placed upright, lie down on their fides, each forming a fegment of a circle. From thence you pafs a fmall cave, above which the pillars, now grown a little larger, are inclining in all directions: in one place in particular, a fmall mafs of them very much refembles the ribs of a fhip. From hence having paffed the cave, which, if it is not low-water, you mult do in a boat, you come to the firft ranges of pillars, which are ftill not above half as large as thofe a little beyond. Over againft this place is a fmall ifland, called in Erfe Boo-foa-la, feparated from the main by a channel not many fathoms wide. This whole ifland is compofed of pillars without any ftratum ahove them; they are flill fmall, but by much the neateft formed of any about the place.
"The firft divifion of the ifland, for at high water it is divided into two, makes a kind of a cone, the pillars converging together towards the centre: on the other they are in general laid down flat: and in the front next to the main, you fee how beautifully they are packed together, their ends coming out fquare with the bank which they form. All thefe have their tranfverfe fections exact, and their furfaces fmooth; which is by no means the cafe with the large ones, which are cracked in all directions. I much queftion, however, if any part of this whole ifland of Boo-fha-la is two feet in diameter.
"The main illanci oppofite to Boo-fha-la, and farther towards the north-weft, is fupported by ranges of pil. lars pretty erect, and, though not tall (as they are not uncovered to the bafe), of large diameters; and at their feet is an irregular pavement, made by the upper fides of fuch as have been broken off, which extends as far under water as the eye can reach. Fere the forms of the pillars are apparent : thefe are of three, four, five, fix, and feven fides; but the number of five and fix are by much the moft prevalent. The largef I meafured was of feven; ; it was four fect five inches in diameter.
"The furfaces of thefe large pillars, in general, are rough and uneven, full of cracks in all directions; the tranfverfe figures in the upright ones never fail to run in thacir truc directions. The furfaces upon which we walked were often flat, having neither concavity nor convexity; the larger number, however, were concave, though fome were very evidently convex. In fome places, the interftices within the perpendicular figures were filled up with a yellow fpar : in one place, a vein paffed in among the mafs of pillars, carrying here and there fmall threads of fpar. Though they were broken and cracked through in all directions, yet their perpendicu. lar figures might eafily be traced: from whence it is eafy to infer, that whatever the acçident might have been that caufed the diflocation, it happened after the formation of the pillars.
"From hence proceeding along thore, you arrive at Fingal's cave. Its dimenfions I have given in the form of a table:

＂The ftratum above the pillars，which is here men－ tioned，is uniformly the fame，confifting of numberlefs fmall pillars，bending and inclining in all directions， fometimes fo irregularly that the ftones can only be faid to have an inclination to affume a columnar form；in others more regular，but never breaking into or difturb－ ing the ftratum of large pillars，whofe tops everywhere keep an uniform and regular line．
＂Proceeding now along the fhore round the north end of the ifland，you arrive at Oura na farve，or the Corvorant＇s Cave．Here the fratum inder the pillars is lifted up very high ；the pillars above it are confider－ ably lefs than thofe at the north welt enid of the ifland， but ftill very confiderable．Beyond is a bay，which cuts deep into the ifland，rendering it in that place not more than a quarter of a mile over．On the fides of this bay，efpecially beyond a little valley，which almoft cuts the ifland into two，are two flages of pillars，but fmall；however，having a ftratum between them exactly the fame as that above them，formed of innumerable little pillars，fhaken out of their places，and leaning in all directions．
＂Having paffed this bay，the pillars totally ceafe；the rock is of a dark－brown ftone，and no figns of regularity occur till you have paffed round the fouth－eaft end of the ifland（a fpace almoft as large as that occupied by the pillars），which you meet again on the weft fide，be－ ginning to form themfelves irregularly，as if the ftratum had an inclination to that form，and foon arrive at the bending pillars where I berran．
＂The ftone of which the pillars are formed，is a coarle kind of bafaltes，very much refembling the Giant＇s Caufeway in Ireland，tlough none of them are near fo neat as the fpecimens of the latter which I have feen at the Britifh Mufeum；owing chiefly to the colour，which in otrs is a dirty brown，in the Infh a fine black；int deed the whole production feems very much to refemble the＇Giant＇s Caufeway．＇
STAFFORD，the county town of Staffordfhire， in W．Lohrviz．o．N．Isat．53．0．It ftands on the river Sow，las two parifl churcles，a fine fquare mar： ket－place；and a fourihhing cloth manufacture．It fends two members to parliament，and is 135 iniles frum Lon－ don．\(\%\)

STAFFORDSHIRE，a county of England；bound－ ed on the fonth byiWorcetterfhire；by Chefhire and Der－ by fhire on the north，by Warwick fhire and Derbyfhire on the eaft，and Sfropfhite and Chefhire on the weft． The length is reckoned 162 miles，the breadth 33， and the circumference 180 ．．It contains 5 handreds， 150 parimes， \(8: 0,000\) aeres，and 18 market towns． The air，except in thofe parts＇s that are called the Moorlands and Woodlands，and about the mines，is grood，efpecially upon the hills，where it is accounted a third called the Spa, near Wolvcrhampton.
very fine. The foil in the northern mountainous parts is not fertile ; but in the middle, where it is watered by the 'Trent, the third river in England, it is both fruitful and pleafant, being a mixture of arable and meadow grounds. In the fouth, it abounds not only with corn, but with mines of iron and pits of coal. The principal rivers of this county, befides the 'I'rent, which runs almoft thro' the middle of it, and abounds with falmon, are the Dove and Tame, both of which are well ftored with fifh. In this county are alfo a great many lakes, or meres and pools, as they are called; which, having freams either running into them or from them, cannot be fuppofed to be of any great prejudice to the air ; they yield plenty of fifh. In divers parts of the county are medicinal waters, impregnated with dif. ferent forts of minerals, and confequently of different qualities and virtues; as thofe at Hints and Brefsfordhonfe, which are mixed with bitumen; thofe at Ingettre; Codfalwood, and Willough-bridge park, which are fulphureous. Of the faline kind are the Brine-pits at Chertley, Epfom; Penfnet-clofe, of which very good falt is made. There is a well at Newcafte-under-Line that is faid to cure the king's evil; another called Elderwell near Blemhill, faid to be good for fore eyes; and

Great flocks of fheep are bred in this county, efpe. cially in the moorlands, or mountains of the northern part of it ; but the wool is faid to be fomewhat coarfer than that of many other counties. Of this wool, how. ever, they make a variety of manufactures, particularly felts. In the low grounds along the rivers are rich paftures for black cattle ; and vaft quantities of butter and cheefe are made. In the middle and fouthern parts not only grain of all kinds, but a great deal of hemp and flax are raifed. This county produces alfo lead, copper, iron ; marble, alabafter, milltones, limeitone; coal, falt, and marles of feveral forts and colours; brickearth, fullers earth, and potters clay \(\oint\), particularly a fort ufed in the glafs manufacture at Amblecot, and fold at feven-pence a bufhel; tobacco-pipe-clay; a fort of reddifh earth called \(\ell_{i} p\), ufed in painting divers veffels; red and yellow ochres; fire-ftones for hearths of iron furnaces, ovens, \&c.; iron.ftones of feveral forts; bloodfones, or liæmatites, found in the brook Tent, which, when wet a little, will draw red lines like ruddle; quar-sy-ftones, and grind-fones. For fuel the county is well fupplied with turf, peat, and coal of feveral forts, as cannel-coal, peacock coal, and pit-coal. the peacockcoal is fo called, becaufe, when turned to the light, it difplaya all the colours of the peacock's tail; but it is fitter for the forge than the kitchen. Of the pit-coal there is an inexhauftible ftore: it burns into white athes, and leaves no fuch cinder as that of the Newcaftle coal. It is not ufed for malting till it is charred, and in that ftate it makes admirable winter-fuel for a chamber.

This county is in the diocefe of Litchfield and Con ventry, and the Oxford circuit. It fends ten members to parliament; namely, two for the county, two for the city of litchfield, two for Stafford, two for Ncwcaftle-under-Line, and two for 'Tamworth.

STAG, in zoology. See Cervus.
Stag-Beetle. See Lucanus.
STAGE, in the modern drama, the place of action and reprefentation included between the pit and the
fcenes, and anfwering to the profcenium or pulpitum of the ancients. See Playhouse and Theatre.

\section*{STAGGERS. See Farriery, § xiii.}

STAHL (Georgc Erneft), an eminent German chemitt, was born in Franconia in 1660, and chofen profeffor of medicine at Hall, when a univerfity was founded in that city in 1694. The excellency of his lectures while he filled that chair, the importance of his various publications, and his extenfive practice, foon raifed his reputation to a very great height. He received an invitation to Berlin in 1716, which having accepted, he was made counfellor of ftate and phyfician to the king. He died in 1734, in the \(75^{\text {th }}\) year of his age. Stahl is without doubt one of the greateft men of which the annals of medicine can boaft: his name marks the commencement of a new and more illuftrious era in chemiftry. He was the author of the doctrine of phlogitton, which, though now completely overturned by the difcoveries of Lavoifier and others, was not without its ufe; as it ferved to combine the fattered fragments of former chemifts into a fyftem, and as it gave rifc to more accurate experiments and a more fcientific view of the fubject, to which many of the fubfequent difcoveries were owing. 'This theory maintained its ground for more than half a century, and was received and fupported by fomc of the moft eminent men which Europe has produced; a fufficient proof of the ingenuity and the abilities of its author. He was the author allo of A Theory of Medicine, founded upon the notions which he entertained of the abfolute dominion of mind over body; in confequence of which, he affirmed, that every mufcular action is a voluntary aet of the mind, whether attended with confcioufnefs or not. This theory he and his followers carried a great deal too far, but the advices at leaft which he gives to attend to the ftate of the mind of the patient are werthy of the attention of phyficians.

His principal works are, 1. Experimenta et Obfervationes Chemica et Phyica, Berlin, 1731, 8vo. 2. Difer. tationes Medica, Hall, 2 vols 4 to. Ihis is a collection of thefes. 3. Theoria Medica vera, 1737, 4to. 4.0. pufculum Chymico-pbyjico.medicum, 1740, 4to. 5. A Treatife on Sulphur, both Inflammable ard Fixed, written in German. 6. Negotium Otiofum, Hall, 1720, 4to. It is in this treatife chiefly that he eftablifhes his fyftem concerning the action of the foul upon the body. 7. Fundamenta Chymica Dogmatice et Experimentalis, Nuremberg, 1747,3 vols 4 to. 8. A Treatife on Salts, written in German. 9. Commentarium in Metallurgian Beccheri, 1723.

STA INing or Colouring of Bone, Horn, Marble, Paper, Wood, \&c. See thefe articles.
- STAIRCASE, in architecture, an afcent inclofed between walls, or a baluiftrade confifting of fairs or fteps, with landing places and rails, ferving to make a communication between the feveral ftories of a houfe. Ser Architecture, \(n^{\circ} 89\), \&c.

STALACTITA, in natural hiftory, cryftalline fpars formed into oblong, conical, round, or irregular bodies, compofed of various crufts, and ufually found hanging: in form of ificles from the roofs of grottocs, \&c.

STALAGMITIS, in botany: A genus of the monacia order, belonging to the polygamia clafs of plants ; and in the natural method ranking under the 38 th or der, Tricocce. The calyx is either quadriphyllous or

\section*{STA [ 723] STA \\ 723 S T A}
hexaphyllous; the corolla confits of four or of fix pe. tals : the receptacle is flefyy, and fomewhat fquare fhaped; the filaments about 30 . In the hermaphrodite flower the filus is thort, thick, and erect; the fruit is a berry of a globular fhape, unilocular, and crowned with the ftylus and figma : they contain three oblong jointed triangular feeds. Of this there is only one fpecies, viz. the Cambogioides, a native of the Eaft Indies and of the warmer parts of America. From this plant is obtained the gutta cambogia, or gum gamboge of the fhops. See Gamboge.

Till very lately botanifts were at a lofs for the true nature of the plant which yields this gum. Koenig, a native of Ireland, and an excellent botanift, travelled over a great part of India, and collected a great number of new plants, and among the reft the ftalagmitis. Thefe he bequeathed to Sir Jofeph Banks prefident of the Royal Society.

STALE, among fportfmen, a living fowl put in a place to allure ad bring others where they may be taken. For want of thefe, a bird fhot, his entrails taken out, and dried in an oven in his feathers, with a ftick thruft through to keep it in a convenient pofture, may Serve as well as a live one.

Stale is alfo a name for the urine of cattle.
Animated STALK. This remarkable animal was found by Mr Ives at Cuddalore : and he mentions feveral kinds of it ; fome appearing like dry ftraws tied together, others like grafs; fome have bodies much lar. ger than others, with the addition of two fcaly imperfeet wings ; their neck is no bigger than a pin, but twice as long as their bodies; their heads are like thofe of an hare and their eyes vertical and very brifk. They live upon flies, and catch thefe infects very dexteroufly with the two fore-feet, which they keep doubled up in three parts clofe to their head, and cart out very quick on the approach of their prey; and when they have caught it, they eat it very voraciouly, holding it in the fame manner as a fquirrel does its food. On the outer joints of the fore-feet are feveral very fharp hooks for the eafier catching and holding of their prey; while, with the other feet, which are four in number, they take hold of trees or any other thing, the better to furprife whatever they lie in wait for. 'They drink like a horie, putting their mouths into the water. Their excrements, which are very white, are almoft as large as the body of the animal, and as the natives fay, dangerous to the eyes.

Sl'AI,LION, or Stone-horse, in the manege, an horfe defigned for the covering of mares, in order to propagate the fpecies. See EQuUs.

STAMFORD, an ancient town of Lincolnhhire in England; feated on the river Welland, on the edge of Northamptonhire. It is a large handfome place, containing fix parifh-churches, feveral good ftreets, and fine buildings. It had formerly a college, the Itudents of which removed to Brazen-Nofe college in Oxford. It slas no confiderable manufactories, but deals chiefly in malt. W. Long. O. 31. N. Lat. 52. 42.

STAMINA, in botany, are thofe upright filaments whish, on opening a flower, we find within the corolla furrounding the pittillum. According to Linnæus, they are the male organs of generation, whofe office it is to prepare the pollen. Each ftamen confifts of two diftinct parts, viz. the filamentum and the anthera.

Stamina, in the animal body, are defined to be thofe Stamina fimple original parts which exitted firt in the embryo or even in the feed; and by whofe diftinction, augmen-

Standard. tation, and accretion by additional juices, the animal body at its utmoft bulk is fuppofed to be formed.

STAMP-duties, a branch of the perpetual revenue.

\section*{See Revenue.}

In Great Britain there is a tax impofed upon all parchment and paper, whereon any legal proccedings or private inftruments of almoft any nature whatfoever are written ; and alfo upon licences for retailing wines, of all denominations; upon all almanacs, newfpapers, advertifements, cards, dice, \&c. Thefe impofts are very various; being ligher or lower, not fo much according to the value of the property transferred, as according to the nature of the deed. The higheft do not exceed \(S_{\text {nith }}\) 's fix pounds upon every fheet of paper or flin of parch-Wealth of ment ; and thefe high duties fall chiefly upon grants vations, from the crown, and upon certain law proceedings, , ol. iii. without any regard to the value of the fubject. There are in Great Britain no duties on the regiltration of deeds or writings, except the fees of the officers who keep the regitter; and thefe are feldom more than a reafonable recompenfe for their labour. The crown derives no revenue from them.

The ftamp-duties conftitute a tax which, though in fome inftances it may be heavily felt, by greatly increafing the expence of all mercantile as well as legal proceedings, yet (if moderately impofed) is of fervice to the public in general, by authenticating inftruments, and rendering it much more difficult than formerly to forge deeds of any ftanding; fince, as the officers of this branch of the revenue vary their ftamps frequently, by marks perceptible to nonc but themfelves, a man that would forge a deed of King William's time, mult know and be able to counterfeit the ftamp of that date alfo. In France and fome other countries the duty is laid on the contract itfelf, not on the inftrument in which it is contained; as, with us too in England (befides the famps on the indentures), a tax is laid, by Itatute 8 Ann. c. 9. on every apprentice-fee; of 6 d in the pound if it be sol. or under, and is. in the pound if a greater fum: but this tends to draw the fubject into a thoufand nice difquifitions and difputes concerning the nature of his contract, and whether taxable or not ; in which the farmers of the revenue are fure to have the advantage. Our general method anfwers the purpofes of the ftate as well, and confults the eafe of the fubject much better. The firft inftitution of the ftampduties was by ftatute 5 and 6 W . and M. c. 21. and they have fince, in many inftances, been increafed to five times their original amount.

STANCHION, or STANCHions, a fort of fmall pillars of wood or iron ufed for various purpofes in a thip; as to fupport the decks, the quarter-rails, the nettings, the awnings, \&c. The firtt of thefe are two ranges of fmall columns fixed under the beams, throughout the fhip's length between decks; one range being on the farboard and the other on the larboard fide of the hatchways. They are chiefly intended to fupport the weight of the artillery.

ST AND, in commerce, a weight from two hundred and an half to three hundred of pitch.
STANDARD, in war, a fort of banner or flag, \(\mathrm{H}_{2}\) borne

\section*{S T A}

Stan'ard, borne as a fignal for the joining together of the feveral Stanhope, troops belonging to the fame body.

Standard, in commerce, the original of a weight, meafure, or coin, committed to the keeping of a magiftrate; or depofited in fome public place, to regulate, adjuft, and try the weights ufed by particular perfons in traffic. See Money.

STANHOPE (Philip Dormer, earl of Chefterfield), was born in 1695 , and educated in Trinity-hall, Cambridge ; which place he left in 1714 , when, by his own account, he was an abfolute pedant. In this character he went abroad, where a familiarity with good company foon convinced him he was totally miftaken in almoft all his notions : and an attentive ftudy of the air, manner, and addrefs of people of fathion, foon polified a man whofe predominant defire was to pleafe; and who, as it afterward appeared, value? exterior accomplifhments beyond any other human acquirement. While Lord Sianhope, he got an early feat in parliament; and in 1722 , fucceeded to his father's eftate and titles. In 1728, and in 1745, he was appointed ambaffador extraordinary and plenipotentiary to Holland: which ligh character he fupported with the greateft dignity ; ferving his own country, and gaining the efteem of the ftates-general. Upon his return from Holland, he was fent lord-lieutenant of Ireland ; and during his adminiftration there, gave gencral fatisfaction to all parties. He left Dublin in 1746 , and in October fucceeded the earl of Harrington as fecretary of ftate, in which poft he officiated until February 6 th 1748 . Being feized with a deafneis in 1754 that incapacitated him for the pleafures of fociety, he from that time led a private and retired life, amufing himfelf with books and his pen; in particular, he engaged largely as a volunteer in a periodical mifcellanenus paper called The World, in which his contributions have a diftinguifhed degree of excellence. He died in 1773 , leaving a character for wit and abilities that had few equals. He dittinguifhed himfelf by his eloquence in parliament on many important occafions; of which we have a characteriftic inftance, of his own relating. He was an active promoter of the bill for altering the Atyle; on which occafion, as he himfelf writes in one of his letters to his fon, he made fo eloquent a fpeech in the houfe, that every one was pleafed, and faid lie had made the whole very clear to them; " when (fays he), God knows, I had not even attempted it. I could juft as foon have talked Celtic or Sclavonian to them, as aftronomy ; and they would have underftood me full as well.". Lord Macclestield, one of the greateft mathematicians in Europe, and who had a principal hand in framing the bill, fpoke afterwards, with all the clearnefs that a thorough knowledge of the fubject could dictate; but not having a flow of words equal to Lord Chefterfield, the latter gained the applaufe from the former, to the equal credit of the fpeaker and the auditors. 'The high character Lord Chefterfield fupported during life, received no fmall injury foon after his death, from a fuller difplay of it by his own hand. He left no iffue by his lady, but had a natural fon, Philip Stanhope, Efq; whofe education was for many years a clofe object of his attention, and who was afterward envoy extraordinary at the court of Drefden, but died before him. When Lord ChefterGeld died, Mr Stanhope's widow publifhed a courfe of

\section*{24 J S T' A}
letters, written by the father to the fon, fillcd with in- Stanhon ftrucions fuitable to the different gradations of the young man's life to whom they were addreffed. Thefe letters contain many fine obfervations on mankind, and rules of conduct : but it is obfervable that he lays a greater ftrefs on exterior accomplifhments and addrefs, than on intellectual qualifications and fincerity; and allows greater latitude to fafhionable pleafures than good morals will juifify, efpecally in paternal inftructions. Hence it is that a celebrated writer \(\oint\), and of manners \(\S\) Dr Yob fomewhat different from thole of the polite earl offon. Chefterfield, is faid to have obferved of thefe letters that "they inculcate only the morals of a whore, with the manners of a dancing-mafter."

Stanhope (Dr George), an eminent divine, was born at Hertifhorn in Derbyfnire, in the year 1660. His father was rector of that place, vicar of St Margaret's church in Leicetter, and chaplain to the earls of Chelterfield and Clare. His grandfather Dr George Stanhope was chaplain to James I. and Charles I.; had the chancellorfhip of York, where he vas alfo a canon refidentiary, held a prebend, and was rector of Weldrake in that county. He was for his loyalty driven from his home with eleven children; and died in 1644. Our author was fent to fchool, firt at Uppingham in Rutland, then at Leicetter; afterwards removed to Eaton; and thence chofen to King's college in
Cambridge, in the place of W. Cleaver. He took the degree of B. A. in \(1681 ;\) M. A. 1658 ; was elected one of the fyndics for the univerfity of Cambridge, in the bufnefs of Alban Francis, 1687 ; minifter of \(Q u 0 i\) near Cambridge, and vice-proctor, 1688 ; was that yeas preferred to the reZory of Tring in HertfordMire, which after fome time he quitted. He was in 1680 prefented to the vicarage of Lewifham in Kent by Lord Dartmouth, to whom he had been chaplain, and tutor to his fon. He was alfo appointed chaplain to King William and Queen Mary, and continued to enjoy that honour under Queen Anne. He commenced D. D. July 5 th 1697 , performing all the offices required to that degree publicly and with great applanfe. He was made vicar of Deptford in 1703 ; fucceeded Dr Hooper as dean of Canterbury the fame year; and was thrice chofen prolocutor of the lower houfe of convoca. tion. His uncommon diligence and induftry, affifted by his excellent parts, enriched him with a large ftock of polite, folid, and ufeful learning. His difcourfes from the pulpit were equally pleafing and profitable; a beautiful intermixture of the cleareft reafoning with the pureft diction, attended with all the graces of a juft elocution. The good Chrittian, the folid divine, and the fine gentleman, in him were happily united. His converfation was polite and delicate, grave without precifenefs, facetious without levity. His piety was real and rational, his charity great and univerfal, fruitful in acts of mercy, and in all good works. He died March 18th 1728, aged 68 years; and was buried in the chancel of the church at Lewifham. The dean was twice married: I, to Olivia Cotion, by whom hehad one fon and four daughters. His fecond lady, who was fifter to Sir Charles Wager, furvived him, dying October ift r 730 , aged about 54. One of the dean's daughters was married to a fon of bifhop Burnet. Bi, fhop Moore of Ely died the day before Queen, Anne; who, it has been faid, defigned our dean for that

\section*{S T A} \(\left[\begin{array}{lll}{[25} & \\ 7\end{array}\right.\) 725 了 S T A
inhore, fee when it thoukd become vacant. Dr Felion fays, nillaus. " The late dean of Canterbury is excellent in the whole. His thoughts and reafoning are bright and folid. His fyle is juft, both for the purity of the language and for the ftrength and beauty of expreffion; but the periods are formed in fo-peculiar an order of the words, that it was an obfervation, nobody could pronounce them with the fame grace and advantage as himfelf." His witings, which are an ineftimable treafure of piety and devotion are, A Paraphrafe and Comment upon the Epiftles and Gofpels, 4 vols, 1705 , 8vo. Sermons at Boyle's Lectures, 1706,4 to., Fifseen Sermons, \(1700,8 \mathrm{vo}\). Twelve Sermons on feveral Occafions, 1727,8 vo. Thomas à Kempis 1696 , 8 vo . Epictetus's Morals, with Simplicius's Com. ment, and the Lite of Epictetus, ryco, 8vo. Parion's Chritian Direetory, 1716, 8vo. Rochefoncault's Maxims, 1706 , 8vo. A Funeral Sermon on Mir Richard Sare bookfeller, 1724; two editions 4 to. Twenty Sermons, publifhed fingly between the years 1692 and 1724. Private Prayers for every Day in the Week, and for the feveral Parts of each. Day; tranflated from the Greek Derotions of Bifhop Andrews, with Additions, 1730 . In his tranflations, it is well known, Dr Stanhope did not confine limfelf to a frict and literal verfion : he took the liberty of paraphrafing, explaining, and improving upon his author ; as will evidently appear (not to mention any other work) by the fighteft perufal of Sr Augultine's Meditations, and the Devotions of Bifhop Andrews.

S'TANISLAUS' (Leczinnki), king of Poland, was born at Leopold the 20 th of Ottocter 1677 . His father was a poli?n noblernari, diftinguifhed by his rank and the important offices which he held, but fill more by his firmnefs and courage. Staniflaus was fent ambaflador in 1704 by the affembly of Warfaw to Clarles XII. of Sweden, who had conquered Poland. He was at that time 27 years old, was general of great Poland, and had been ambaffacor extraordinary to the Grand Signior in 1599 . Charles was fo delighted with the franknefs and fincerity of his deportment, and with the firmnefs and fweetnefs which appeared in his countenance, that he offered him the crown of Poland, and ordered him to be crowned at Warfaw in 1705. He accompanied Charles XII. into Saxony, where a treaty was concluded with King Auguftus in 1705, by which that prince refigned the crown, and acknowledged Stariiflaus king of Poland. The new monarch remained in Saxony with Charles till 1707, when they returned into Poland and attacked the Ruffians, who were obliged to evacuate that kingdom in 1708. But Charles being defeated by Peter the Great in 17<9, Augufus returned into Poland, and being affilted by a Ruffian army, obliged Staniflaus to retire firt into Sweden, and afterwards into Turkey. Soon after he took up his refidence at Weiffenburg, a town in Alface. Auguftus difpatched Sum his envoy to France to complain of this; but the duke of Orleans, who was then regent, returned this anfwer: "'ell your king, that France has always been the afylum of unhappy princes." Stanilaus lived in oblcurity till 1725 , when Louis XV. efpoufed the princefs Mary his daughter. Upon the death of King Auguftus in 1733 , he returned to Pokand in hopes of remounting the throne of that kingdom. A large party declared for him; but his com.
petitor the young elector of Saxony, being filpported S*a iflater by the Emperor Charles VI. and the Emprefs of Ruf. fia, was chofen king, though the majority was againft him. Dantzic, to which Staniflaus had retired, was quickly taken, and the unfortunate prir.ce made his efcape in difguife with great difficulty, after hearing that a price was fet upon his head by the Ruffians. When peace was concluded in 1736 between the Emperor and France, it was ayrred that Staniflaus fhould abdicate the throne, but that he fhould be acknowledged king of Poland and grand duke of Lithuania, and continue to bear thefe titles during life ; that all his effects and thofe of the queen his fponfe fhould be refored; that an amnefly fhould be deelared in Poland for all that was patt, and that every perfon fhould be reftored to his poffeffions, rights, and privileges : that the elector of Saxony fhould be acknowledged king of Poland by all the powers who acceded to the treaty: that Stanifaus thould be put in peacable poffeffion of the duchies of Lorrain and Bar; but that immediately after his death thefe duchies fhould be united for ever to the crown of France. Stanifaus fucceeded a race of princes in Lorrain who were beloved and regretted: and his fubjects found their ancient foveleigns revived in lim. He tafted then the pleafure which he had fo long defired, the pleafure of making men happy. He affitted his new fubjects ; he embellifined Nancy and Lunćville; he made uleful eftablifhments; he founded colleges' and built hofpitals, He was engaged in thefe noble employments, when an accident occalioned his death. His night-gown caught fire and burnt him fo feverely before it could be extinguifhed, that he was feized with a fever, and died the 23d of February 1766. His death occafioned a public mournirg : the tears of his fubjects indeed are the beft eulogium upon this prince. In his youth he liad accuftomed himfelf to fatigue, and had thereby ftrengthened his mind as well as lisis conflitution. He lay always upon a kind of mattrels, and feldom required any fervice from his domeftics. He was temperate, liberal, adored by his vaffals, and perhaps the only nobleman in Poland who had any friends. He was in Lorrain what he had been in his own country, gentle, affable, compaffionate, treating his fubjects like equals, participating their forrows and alleviating their misfortunes. He refembled completely the pieture of a philofopher which he himfelf has drawn. "The tuue philofopher (faid he) ought to be free from prejudices, and to know the value of reafon: he ought neither to think the higher ranks of life of more value than they are, nor to treat the lower orders of mankind with greater contempt than they deferve: he ought to enjoy pleafures without being a flave to them, riches without being attached to them, honours without pride or vanity : he ought to fupport difgraces without either fearing or courting them: he ought to reckon what he poffeffes fufficient for him, and to regard what he has not as ufelefs: he ought to be equal in every fortune, always tranquil, always gay : he ought to love order, and toobferve it in all his actions: he ought to be fevere to himfelf, but indulgent to others: he ought to be frank and ingenuous without rudenefs, polite without falfehood, complaifant without bafenefs: he ought to have the courage to difregard every kind of glory, and to reckon as nothing even philofophy itfelf." Such was Slanillaus in every fituation. His temper was affection-

\section*{S T A [ 726 j S T A}

Staniflats ate. He told his treafurer one day to put a certain
\(\|\). officer on his lift, to whom he was very much attached : \(\underbrace{\text { Stannary. "In what quality (faid the treafurer) thall I mark }}\) him down ?" "As my friend" (replied the monarch.) A young painter conceiving hopes of making his fortune if his talents were made known to Staniflaus, prefented him with a picture, which the courtiers criticifed feverely. 'The priuce praifed the performance, and paid the painter very generoully: then turning to his courtiers, he faid, "Do ye not fee, gentlemen, that this poor man muft provide for his family by his abilities? if you difcourage him by your cenfures, he is undone. We ought always to affift men; we never gain any thing by hurting them." His revenues were imall; but were we to judge of him by what he did, we fhould probably reckon him the richeft potentate in Europe. A fingle inftance will be fufficient to fhow the well judged economy with which his benevolent plans were conducted. He gave 18,000 crowns to the magiltrates of Bar to be employed in purchafing grain, when at a low price, to be fold out again to the poor at a moderate rate when the price fhould rife above a certain fun. By this ar rangement (fay the authors of Digionaire Hiforique), the money increafes continually, and its sood effects may in a fhort time be extended over the whole province.

He was a protector of the arts and fciences: he wrote feveral works of philofophy, politics, and morality, which were collected and publifhed in France in 1765 , in 4 vols, 8vo. under the title of Oeuvres du Pbilofophe Bienfaifant,"the works of the Benevolent Philofopher."

STANITZAS, villages or fmall diftricts of the banks of the Don, inlabited by Coffacs.

STANLEY (Thomas), a very learned Englifh writer in the 17 th century, was the fon of Sir Thomas Stanley of Cumberlow-Green in Herefordhire, kniglit. He was born at Cumberluw about 1644 , and educated in his father's houfe, whence he removed to the univerfity of Cambridge. He afterwards travelled; and, upon his return to England, profecuted his ftudies in the Middle Temple. He married, when young, Dorothy, the eldeft daughter of Sir James Engan of Flower, in Northamptonfhire. He wrote, 1. A volume of Poems. 2. Hiftory of Philofophy, and Lives of the Philofophers. 3. A 'Tranfation of Efchylus, with a Commentary ; and feveral other works. He died in .7678.

STANNARIES, the mines and works where tin is dug and purified; as in Cornwall, Devonfhire, \&c.

STANNARY courts, in Devonfhire and Cornwall, for the adminiftration of juftice among the tinners therein. They are held before the lord-warden and his fubflitutes, in virtue of a privilege granted to the workers in the tin-mines there, to fue and be fued only in their own courts, that they may not be drawn from their bufinefs, which is highly profitaule to the public, by attending their law-fuits in other courts. The privileges of the tinners are confirmed by a charter, 33 Edw. I. and fully expoinnded by a private ftasute, 50 Edw. III. which has fince been explained by a public act, 16 Car. I. c. 15. What relates to our prefent purpofe is only this: That all tinners and labourers in and about the ftannaries fhall, during the time of their working therein, bona fide, be privileged from fuits of other courts, and be only pleaded in the ftannary court in all matters, excepting pleas of land,
life, and member. No writ of error lies from henee to Stanny any court in Weftminfter hall; as was agreed by all the judges, in 4 Jac . I. But an appeal lies from the fteward of the court to the under-warden; and from him to the lord-warden; and thence to the privy-council of the prince of Wales, as duke of Cornwall, when he hath had livery or inveftiture of the fame. And from thence the appeal lies to the king himfelf, in the laft refort.

STANNUM, tin. See Chemistry-Index, and Tin.

STANZA, in poetry, a number of lines regularly adjufted to each other; fo much of a poem as contains every variation of meafure or relation of rhyme ufed in that poem.

STAPHYLEA, Bladder-nut, in botany: A genus of plants belonging to the clafs of pentandria, and order of trigynia; and in the natural fyltem arranged under the 23 d order, tribilate. The calyx is quinque. partite. There are five petals. The capfules are chree, inflated and joined together by a longitudinal future. I'he feeds are two, and are globofe with a fcar. There are two fpecies, the pinnata and trifolia. The pinnata, or bladder-nut-tree, is a tall fhrub or tree. The leaves are pinnated; the pinnæ are generally five, oblong, pointed, and notched round the edyes. The flowers are white, and grow in whirls on long pendulous footitalks. This plant flowers in June, and is frequent in hedjes about Pontefract and in Kent. The trifolia, or threeleaved bladder-nut, is a native of Virginia.
STAPHYLINUS, a genus of animals belonging to the clafs of infecia, and order of coleoptera. The, antennæ are moniliform ; the feelers four in number; the elytra are not above half the length of the abdomen; the wings are folded up and concealed under the elytra; the tail or extremity of the abdomen is fingle, is provided with two long veficles which the infect can fhoot out or draw back at pleafure. Gmelin enumerates 117 fpecies, of which five only are natives of Great Britain ; the murinus, maxillofus, rufus, riparius, chryfomelinus.
1. Murinus. 'The head is depreffed. The colour is grey, clouded with black. The length is fix lines. It lives among horfe-dung. 2. The maxillofus is black, with afh-coloured ftripes, and jaws as-long as the head. It inhabits the woods. 3 . Rufus is of an orange-colour ; but the pofterior part of the elytra and abdomen is black, as are alfo the thighs at their bafe. 4. Riparius is of a reddifh brown colour; but the clytra are azure. coloured ; and the head, antennæ, and two laft rings of the abdomen, are black. It is frequert on the banks of rive:s in Europe. 5. Cbry/omelinus. is black ; the thorax, elytra, and feet being teftaceous. It is found in the north of Europe.

The infects have a peculiarity to be met with in almolt every feecies of this genus, which is, that they frequently turn up their tail, or extremity of the abdo. men, efpecially if you chance to touch them; in which cafe the tail is feen to rife immediately, as if the infect meant to defend itfelf by ftinging. Yet that is not the place where the infect's offenfive weapons are fituated. Its tail has no fting, but in recompenfe it bites and pinches ftrongly with its jaws; and care mult be Barbut's taken, efpecially in laying hold of the larger fpecies. Genera \(I\) Their jaws are ftrong, fhoot out beyond the head, and fe.Torum. are fubfervient to the animal in feizing and deftroying

\section*{S T A [ 727 ] S TA}
taple, its prey. It feeds on all other infects it can catch: even frequently two flaphylini of the fame fpecies bite and tear each other. Though this infect has very fmall elytra, yet its wings are large; but they are cmionfly folded up, and concealed under the elytra. The infect unfolds and expands them when he chooles to fly, which he does very lightly. Among the fmall fpecies of this genus, there are feveral whofe colours are lively and fingularly intermingled.

Some of them are found upon flowers, but they chiefly inhabit the dung of cows. Their larvæ, which refemble them fo much as to be fcarce diftinguifhable, live in damp places under ground. They are by fome called Rove beetles.

STAPLE, primarily fignifies a public place or market, whither merchants, \&c. are obliged to bring their goods to be bought by the people; as the Greve, or the places alony the Seine, for fale of wines and corn, at Paris, whither the merchants of other parts are obliged to bring thofe commoditics.

Formerly, the merchants of England were oblired to carry their wool, cloth, lead, and other like ftaple commodities of this realm, in order to expofe then by wholefale; and thefe faples were appointed to be conftantly kept at York, Lincoln, Newcaftle upon Tyne, Norwich, Weftminfter, Canterbury, Chichefter, Winchefter, Exeter, and Briftol; in each whereof a public mart was appointed to be kept, and each of them had a court of the mayor of the ftaple, for deciding differences, held according to the law-merchant, in a fummary way.

STAR, in aftronomy, a general name for all the heavenly bodies, which, like fo many brilliant ftuds, are difperfed throughout the whole heavens. The flars are ditinguifhed, from the phenomena of their motion, \&c. into fixed, and erratic or wandering fars : thefe laft are again diftinguilhed into the greater luminaries, viz. the fun and moon; the planets, or wandering ftarz, properly fo called; and the comets; which have been all fully confidered and explained under the article Astronomy. \(\Lambda s\) to the fixed fars, they are fo called, becaufe they feem to be fixed, or perfeetly at feft, and confequently appear always at the fame diftance from each other.

Falling Sqars, in meteorology, fiery meteors which dart throuph the fiky in form of a ftar. Sce Meteor.

Twinkling of the Siars. See Optics, \(\mathrm{n}^{\circ} 21\). et feq.

Star, is alio a badse of honour, worn by the knights of the garter, bath, and thiftle. See Garter.

Star of Betblehem, in botany. See Ornithogaum.

Court of Star-chamber, (camera fellata), a famous, or rather infamous, Englifh tribunal, faid to have been fo called either from a Saxon word fignifying to feer or govern; or from its punifhing the crimen flellionatus, or colenage; or becaufe the room wherein it fat, the old councifchamber of the palace of Weftminfter, (Lamb 148.) which is now converted into the lotteryoffice, and forms the eaftern fide of New Palace-yard, was full of windows.; or, (to which Sir Edward Coke, 4 Inft. 66. accedes), becaufe baply the rouf thereof was at the firt garnihed with gilded firss. As all there are merely conjectures, (for no ftars are now in the roof, nor are any faid to bave remained there fo late as
the reign of queen Elizabeth), it may be allowable to Star. propofe another conjectural etymology, as plaufible perhaps as any of them. It is well known, that, before the banifhment of the Jews under Edward I. their con- Blackp. tracts and obligations were denominated in our ancient Commert. records farra or farrs, from a corruption of the He-vol. iv. brew wore, Seetar, a covenant. (Tovey's Angl. Fudaic. p. 360. 32. Selden. tit. of hon. ii. 34. Uxor Ebraic. i. I4.) Thefe ftarrs, by an ordinance of Richard the Firt, preferved by Hoveden, were commanded to be enrolled and depofited in chefts under three keys in certain places; one, and the moft confidcrable, of which was in the king's exchequer at Weftminfter : and no ftarr was allowed to be valid, unlefs it were found in fome of the faid repofitories. (Memorand. in Scac' P. 6. Edw. I. prefixed to Maynard's year-book of Edw. IL. fol. 8. Madox hilt. exch. c. vii. \(\oint 4,5,6\).) The room at the exchequer, where the chefts containing thefe farrs were kept, was probably called the far.chamber ; and, when the Jews were expelled the kin:sdom, was applied to the ufe of the king's council, fitting in their judicial capacity. To confirm this, the firf time the far-chamber is mentioned in any record, it is faid to have been fituated near the receipt of the exchequer at Weftminfter: (the king's council, his chancellor, treafurer, juftices, and other fages, were affembled en la chaumbre des effeilles pres la refceipt al Weftminfter. Clauf. 41 Edw. III. m. 13.) For in procefs of time, when the meaning of the Jewifh farrs were forgotten, the word far-chamber was naturally rendered in law French, la chaumbre des efleiller, and in law Latin camera fellata; which continued to be the ftyle in Latin till the diffolution of that court.

This was a court of very ancient original ; but new. modelled by ftatutes 3 Hen. VII. c. I. and 21 Hen. VIII. c. 20. confifting of divers lords fpiritual and temporal, being privy-counfellors, together with two judges of the courts of common-law, without the intervention of any jury. 'their jurifdiction exteaded legally over riots, perjury, mibehaviour of fheriffs, and other notorious middemeanors, contrary to the laws of the land Yet this was afterwards (as lord Clarendon informs us). ftretched "to the afferting of all proclamations and orders of ftate; to the vindicating of illegal commif. fions and grants of monopolies; holding for honourable that which pleafed, and for juft that which profit. ed ; and becoming both a court of law to determine civil rights, and a court of revenue to enrich the trea. fury : the council-table by proclamations enjoining to the people that which was not enjoined by the laws, and prohibiting that which was not prohibited; and the ftar-chamber, which confrited of the fame perfons in different rooms, cenfuring the breach and diffobedience to thefe proclamations by very great fines, imprifon. ments, and corporal feverities : fo that any difrefpect to any acts of flate, or to the perfons of ftatefmen, was in no time more penal, and the foundations of right never more in danger to be deftroyed." For which reafons, it was finally abolifhed by ftatute 16 Car. I. c. 10 , to the general joy of the whole nation. See King's. Bench. There is in the Britifh Mufeum (Harl. MSS, Vol. I: n \({ }^{\circ}\) 2.6.) a very full, methodical, and accurate account of the conftitution and courfe of this court, compiled by William Hudfon of Gray's Inn, an eminent prace titioner therein, A frort account of the fame, with

Sar, Starch.
copics of all its procefs, may alfo be found in 18 Rym. Foed. 192, \&c.

Star-Board, the right fide of the fhip when the eye of the fpectator is directed forward.

Star-Fi/b. See Asterias.
STAR Joot, a gelatinous fubflance frequeptly found in fields, and fuppofed by the vulgar to have been produced from the meteor called a falling flar: but, in reality, is the half-digefted food of herons, fea me:ws, and the like birds; for thefe birds have been found, when newly fhot, to difgorge a fubftance of the fame kind.

Star-Stone, in natural hiftory, a name given to certain extraneous foffil ftones, in form of hort, and commonly fomewhat crooked, columns compofed of feveral joints, each refembling the figure of a radiated ftar, with a greater or fmaller number of rays in the different fpecies: they are ufually found of about an inch in length, and of the thicknefs of a goofe-quill. Some of them have five angles or rays, and others only four ; and in fome the angles are cquidiftant, while in others they are irregularly fo: in fome alfo they are fhort and blunt, while in others they are long, narrow, and pointed ; and fome have their angles very fhort and obtufe. The feveral joints in the fame fpecimen are ufually all of the fame thicknefs; this, however, is not always the cafe: but in fome they are larger at one end, and in others at the middle, than in any other part of the body; and fome fpecies have one of the rays bifid, fo as to emulate the appearance of a fix-rayed kind.

Star-Tbifle, in botany. See Centaurea.
Star-Wort, in botany. Sce Aster.
STARCH, a fecula or fediment, found at the bottom of veffels wherein wheat has been fteeped in water, of which fecula, after feparating the bran from it, by paffing it through fieves, they form a kind of loaves, which being dried in the fun or an oven, is afterwards cut into little, pieces, and fo fold. The beft farch is white, foft, and friable, and ealily broken into powder. Such as require fine ftarch, do not content themfelves, like the ftarclimen, with refufe wheat, but ufe the fineft grain. The procers is as follows: The grain, teing well cleaned, is put to ferment in veffels full of water, which they expofe to the fun while in its greatelt heat; changing the water twice a-day, for the face of eight or twelve days, according to the feafon. When the grain burfts eafily under the finger, they judge it fuffi: ciently fermented. The fermentation perfected, and the grain thus foftened, it is put, handful by handful, into a canvas bag, to feparate the flour from the hufks; which is done by rubbing and beating it on a plank laid acrofs the mouth of an empty veffel that is to receive the flour.

As the veffels are filled with this liquid flour, there is feen fwimming at top a reddifh water, which is to be carefully fcummed off from time to time, and clean water is to be put in its place, which, after ftirring the whole together, is alfo to be ftrained through a cloth or fieve, and what is left behind put into the veffel with new water, and expofed to the fun for fome time. As the fediment thickens af the bottom, they drain off the water four or five times, by inclining the veftel, but swithout paffiny it through the fieve. What reinains at bottom is the ftarch, which they cut in pieces to get
out, and leave it to dry in the fun. When dry, it is laid up for ufe.

STARK (Dr William), known to the public by a volume containing Clinical and Anatomical Obfervations, with fome curious Experiments on Dict, was born at Manchefter in the month of July 1740 ; but the family from which he fprang was Scotch, and refpectable for its antiquity. His grandfather John Stark of Killer* mont was a covenanter ; and having appeared in arms againft his fovereign at the battle of Bothwell bridse in the year I 679 , became obnoxious to the government, and to conceal himfelf, withdrew into Ireland. There is reafon to believe that he had not imbibed either the extravagant zeal or the favage manners of the political and relisious party to which he adhered; for after refiding a few years in the country which he had chofera for the fcene of his banifhment, he married Elizabeth daughter of Thomas Stewart Elq; of Balydrene in the north of Ireland; who, being defcended of the noble family of Galloway, would not probably have matched his daughter to fuch an exile as a ruthlefs fanatic of the laft century. By this lady Mr Stark had feveral chil. dren ; and his fecond fon Thomas, who fettled at Manchefter as a wholefale linen-draper, and married Margaret Stirling, danghter of William Stirling, Efq; of Northwoodfide, in the neighbourhood of Glalgow, was the father of the fubject of this article. A nother of his fons, the reverend John Stark, was minitter of Le. cropt in Perththire; and it was under the care of this gentleman that our author received the rudiments of his education, which, when we confider the character of the mafter, and reflect on the relation between him and his pupil, we may prefume was calculated to fore the mind of Dr Stark with thofe virtuous priaciples which influenced his conduct through life.

From Lecropt young Stark was fent to the univerfity of Glafgow, where, under the tuition of the Doctors Smith and Black, with other eminent mafters, he learned the rudiments of fcience, and acquired that mathematical accuracy, that logical precifion, and that contempt of hypothefes, with which he profecuted all his future Atudies. Faving chofen phyfic for his profeffion, he removed from the univerfity of Glafgow to that of Edinburgh, where he was foon diftinguifhed, and hónoured with the friendfhip of the late Dr Cullen ; a man who was not more eminently confpicuous for the fupe: riority of his own genius, than quick-fighted in perceiving, and liberal in encouraging, genius in his pupils. Having finifhed his ftudies at Edinburgh, though he took there no degree, Mr Stark, in the year \(1765^{\circ}\), went to London, and devoted himfelf entirely to the ftudy of phyfic and the elements of furgery; and look. ing upori anatomy as one of the principal pillars of both thefe arts,' he ende'zoured to complete with Dr \(\mathrm{H}_{\mathrm{H}}^{2}\) ? ter what he had begun with Dr Monro; and under thefe two eminent profeffors he appears to have acquired a hiorh degree of anatomical kuowledge. He likewife entered himfelf about this time a pupil at St Georse's hofpital; for 'being difgufted, as he often confeffed', with the inaccuracy or want of candour oblervable in the generality of practical writers, lie determined to pbtain an acquaintance with difeafes at a better fchool and from an abler nafter; and to have from his own expenence aftandard, by which be might judge of the ex. 7

\section*{S T A [.729 \(7 \quad\) S T A}
perience of others. With what induftry he profecuted milk; afterwards he tried bread and water with roaffed this plan, and with what fuccefs his labours were crowned, may be feen in a feries of Clinical and Anatornical Obfervations, which were made by him during his attendance at the hofpital, and were publifhed after his death by his friend Dr Carmichael Smyth. Thefe obfervations give the public no caufe to complain of want of candour in their author; for whatever delicacy he may lave obferved, when relating the cafes of patients treated by other phylicians, he has related thofe treated by himfelf with the utmoft impartiality. Whilf at. tending the hofpital, he likewife employed lrimelelf in making experiments on the blood, and other animal fluids; and alfo in a courfe of experiments in chemical plarmacy; but though accounts of thefe experiments were left behind him, we believe they have not yet been given to the public.

In the year \({ }^{1} 767 \mathrm{Mr}\) Stark went abroad and obtained the degree of M. D. in the univerfity of Leyden, prblifhing an inaugural differtation on the dyfentery. On his return to London, he recommenced his fudies at the hofpital; and when Dr Black was called to the chemical chair in Edinburgh, which he has long filled with fo much honour to himfelf and credit to the univerfity, 1)r Stark was folicited by feveral members of the univerfity of Glafgow to fland a candidate for their profefforfhip of the theory and practice of phyfic, rendered vacant by Dr Black's removal to Eudinburgh. This however Dr Stark declined, being influenced by the advice of his Englifh friends, who wifhed to detain him in Lourdon, and having likewife fome profpects of an appointmest in the hofpital.
In the mean time he had commenced (1769) a feries of experiments on diet, which he was encouraged to undertake by Sir John Pringle and Dr Franklin, whofe friendfhip he enjoyed, and from whom he received many hints refpecting both the plan and its execution. Thefe experiments, or rather the imprudent zeal with which he profecuted them, provel in the opinion of his friends, fatal to himfelf; for he began them on the 12 th of July 1669 in peifect health and vigour, and from that day, though his health varied, it was feldom if ever good, till the 23 d ef February 1770 , when he died, after fuffering much uneafinefs. His friend and biographer Dr Smyth thinks, that other caufes, particularly chagrin and difappointment, had no fmall hare in haftening lis death ; and as the Doctor was intimately acquainted with his character and difpofition, his opinion is probably well-founded, though the pernicious effects of the experiments are vifible in Dr Stark's own journal. When he entered upon them, the weight of his body was 12 ftone 3 lb . avoirdupois, which in a very few days was reduced to is flore 10 lb 8 oz : and though fome kinds of food increafed it, by much the greater part of what he ufed had a contrary effect, and it continued on the -whole to decreafe till the day of his death. This indeed can excite no wonder. Though the profeffied object of his experiments was to prove that a pleajant and varied diet is equally conducive to health with a more frict and fimple one, moft of the difhes which he ate during thefe experiments were neither pleafant nor fimple, but compounds, fuch as every itomach muft naufeate. He began with bread and water; from which he proceeded to bread, water, and Jingar; then to bread, zueter, and oil of olives; then to bread and zvater with

Vol. XVII. Part II.
goofe; bread and water with boiled berf; flewed lean of beef with the gravy and water without bread ; flewed lean of beef with the gravy, oil of fat or fuet and woter;
 flour, oil of fuet, water and falt; flour, water, and falt; and a number of others infinitely more difagreeable to the ftomach than even thefe; fuch as bread, fat of bucon bam, infulion of tea with fugar; and brend or four with boney and the infufion of rofemary. But though we confider Dr Stark's experiments as whimfical, it cannot be denied that they indicate eccentricity of genius in the perfon who made them; and fuch of our readers as think genius hereditary, may perhaps be of opinion, that he derived a ray from the celebrated Napier the inventor of the logarithms, who was his anceftor by both parents. At any rate, thefe experiments, of which a full account is given in the fame volume with his clinical and anatomical obfervations, difplay an uncommon degree of fortitude, perfeverance, felf-denial, and zeal for the promoting of ufeful knowledge in their author ; and with refpect to his moral character, we believe it is with great juftice that Dr Smyth compares him to Cato by applying to him what was faid of that virtuous Roman by Salluft.-" Non divitiis cum divite, neque factrone cum factiofo; fed cum ftrenuo virtnte, cum modefto pudore, cum innocente abftinentia certabat ; effe, quanı videri, bonus malebat *."

STA TES, or Estates, a term applied to feveral ordexs or claffes of people affembled to confult of matters for the public good.

Thus ftates-general is the name of an affembly confifting of the deputies of the feven United Provinces. Thefe are ufually 30 in number, fome provinces fending two, others more; and whatever refolution the fates-general take, mult be confirmed by every province, and by every city and republic in that province, before it has the force of a law. The deputies of each province, of what number foever they be, have only one voice, and are efteemed as but one perfon, the votes being given by provinces. Each province prefides in the affembly in its turn, according to the order fettled among them. Guelderland prefides firt, then Holland, \&c.

States of Holland are the deputies of eighteen cities, and one reprefentative of the nobility, conftituting the ftates of the province of Holland: the other provinces have likewife their fates, reprefenting their fovereignty; deputies from which make what they call the fates-ge. neral. In an affembly of the ftates of a particular province, one diffenting voice prevents their coming to any refolution.

STATICE Thrift, in botany: A gems of plants belonging to the clafs of pentandria, and order of pentagynia; and in the natural fyftem ranging under the 48 th order, aggregata. The calyx is monoplyllons, entire, folded, and fcariofe. There are five petals, with one fuperior feed. There are 22 fpecies, the armeria, pfendarmeria, limonium, incana, cordata, reticulata, echioides, fpeciofa, tatarica, echinus, flexuofa, purpurata, minuta, fuffruticofa, monopetala, aurea, ferulacea, linifolia, pruinofa, fimata, mucronata, and lobata. I'hree of thefe are Britifh plants.
1. The armeria, thrift, or fea gilly-flower, has a fimple

\section*{S T A [730 ] S T A}

Statics, naked flem about fix inches hish. The radical leaves are like grafs. The flowers are terminal, pale red, with a round head, and not very large. This plant flowers in July or Auguft, and grows in meadows near the fea.
2. Limonium, fea lavender. 'Ihe ftem is naked, branched, and about a foot high. 'The radical leaves are lons, pointed, and grow on footftalks. The flowers are blue, and grow on long fpikes on the tops of the branches. It grows on the fea-coaft in South Britain.
3. Reticulata, matted fea-lavender. The ftem is proftrate, and terminated by a panicle of flowers. 'I'he branches are naked, barren, and bent back. The leaves are wedge fhaped. 'This fpecies is alfo found on the fea-coaft of South Britain.

SIATICS, a term which the modern improvements in knowledge have made it neceffary to introduce into phyfico-mathematical fcience. It was found convenient to diffribute the doctrines of univerfal mechanics into two claffes, which required both a different mode of confideration and different principles of reafoning.

Till the time of Archimedes little fcience of this kind was poffeffed by the ancients, from whom we have received the firft rudiments. His inveftigation of the centre of gravity, and his theory of the lever, are the foundations of our knowledge of common mechanics; and his theory of the equilibrium of floating bodies contains the greateft part of our hydroftatical knowledge. But it was as yet limited to the fimpleft cafes; and there were fome in which Archimedes was i noorant, or was miftaken. The marquis Guido Ubuldi, in \(157^{8}\), publifhed his theory of mechanice, in which the doctrines of Archimedes were well explained and confiderably, aurmented. Stevinus, the celebrated Dutch engineer, publifbed about 20 years after an excellent fyitem of mechanics, containing the chicf principles which now form the fcience of equilibrium among folid bodies. In particular, he gave the theory of inclined planes, which was unknown to the ancients, though it is of the very firt importance in almoft cvery machine. He even ftates in the moft exprefs terms the principle afterwards made the foundation of the whole of mechanics, and publifhed as a valuable difovery by Varignon, viz. that three forces, whofe directions and intenfities are as the fides of a triangle, balance each other. His theory of the preffure of fluids, or hydroftatias, is no lefs eftimable, including every thing that is now received as a leading principle in the fcience. When we confider the ignorance, even of the moft learned, of that age in mechanical or phyfico-mathematical know. ledge, we muft confider thofe performances as the works of a great genius, and we regret that they are fo little known, being loft in a croud of good writings on thofe fubjects which appeared foon after.

Hitherto the attention had been turned entirely to equilibrium, and the circumftances neceffary fer producing it. Mechanicians indeed faw, that the energy of a machine might be fomehow meafured by the force which could be oppofed or overcome by its intervention : but they did not remark, that the force which prevented its motion, but did no more than prevent it, was an exalt meafure of its energy, becaufe it was in immediate equilibrio with the preffure exerted by that part of the machine with which it was connected. If this oppofed force was lefs, or the force acting at the other extremity of the machine was greater, the me-
chanicians knew that the machine would move, and that work would be performed; but what would be the rate of its motion or its performance, they hardly pretended to conjecture. They had not ftudied the action of moving forces, nor conceived what was done when motion was communicated.

The great Galileo opened a new field of fpeculation in his work on Local Motion. He there confiders a change of motion as the indication and exact and adequate meafure of a moving force; and he confiders every kind of preffure as competent to the production of fuch changes. - He contented himfelf with the application of this principle to the motion of bodies by the action of gravity, and gave the theory of projectiles, which remains to this day without change, and only improved by conlidering the changes which are produced in it by the refiftance of the air.

Sir Ifaac Newton took up this fubject nearly as Galileo had left it. For, if we except the theory of the centrifugal forces arifing from rotation, and the theory of pendulums, publithed by Huygens, hardly any thing had been added to the fcience of motion. Newton confidered the fubject in its utmoft extent ; and in his mathematical principles of natural philofophy he confiders every conceivable variation of moving force, and determines the motion refulting from its action. - His firlt application of thefe doctrines was to explain the celeftial motions; and the magnificence of this fubject caufed it to occupy for a while the whole attention of the mathematicians. But the fame work contained propofifitions equally conducive to the improvement of common mechanics, and to the complete underftanding of the mechanical actions of bodies. Philofophers began to make thefe applications alio. They faw that every kind of work which is to be performed by a machine may be confidered abftractedly as a retarding force; that the impulfe of water or wind, which are employed as moving powers, act by means of preffures which they exert on the impelled. point of the machine; and that the machine itfelf may be confidered as an affemblage of bodies moveable in certain limited circumftances, with determined directions and proportions of velocity. From all thefe confiderations refulted a general abftract condition of a body acted on by known powers. And they found, that after all conditions of equilibrium were fatisfied, there remains a furplus of moving force. They could now ftate the motion which will enfue, the new refiftance which this will excite, the additional power which this will abforb; and they at laft determined a new kind of equilibrium, not thought of by the ancient mechanicians, between the refiltance to the machine performing work and the moving power, which exacily balance each other, and is indicated, not by the \(r \subset f\), but by the uniform motion of the machine.-In like manner, the mathematician was enabled to calculate that precife motion of water which would completely abforb, or, in the new language, balance the fuperiority of preffure by which water is forced through a fluice, a pipe, or canal, with a conftant velocity.

Thus the general doctrines of motion came to be confidered in two points of view, according as they balanced each other in a ftate of reft or of uniform motion. Thefe two ways of confidering the fame fubject required both different principles and a differeut manner of reafoning. The firft has been named Sratics, as ex-

\section*{S TA [ 53 t\(] \quad\) S TA}
preffing that reft which is the tefl of this kind of equiplibrium. The fecond has been called Dynamics or Universal Mechanics, becaufe the different kinds of motion are characteriflic of the powers or forces which produce them. A knowledge of both is indifpenfably neceffary for acquiring any ufeful practical knowledge of machines : and it was ignorance of the doctrines of accelerated and retarded motions which made the progress of practical mechanical knowledge fo very flow and imperfect. The mechanics, even of the moderns, before Galileo, went no further than to fate the proportion of the power and refiftance which would be balanced by the intervention of a given machine, or the proportion of the parts of a machine by which two known forces may balance each other. I his view of the matter introduced a principle, which even Galileo confidered as a mechanical axiom, viz. that what is gained in force by means of a ma thine is exactly compensated by the additional time which it obliges us to employ. This is false in every inftance, and not orly prevents improvement - in the conftruction of machines, but leads us into erroneous maxims of conftruction. The true principles of dynamics teach us, that there is a certain proportion of the machine, dependent on the kind and proportion of the power and refiltance, which enables the machine to perform the greateft poifile work.

It is highly proper therefore to keep separate there two ways of confidering machines, that both may be improved to the utmost, and then to blend them togethar in every practical difcuffion.

Statics therefore is preparatory to the proper fury of mechanics; but it does not hence derive all its importance, It is the fore foundation of many ufeful parts of knowledge. This will be bet feen by a brief enumeration.
I. It comprehends all the doctrines of the excitement and propagation of preffure through the parts of folid bodies, by which the energies of machines are produced. A preffure is exerted on the impelled point of a machine, fuck as the fioat-boards or buckets of a mill-wheel. This excites a preffure at the pivots of its axle, which act on the points of fupport. This mut be underfood, both as to direction and intenfity, that it may be effectally refifted. A preffure is alfo excited at the acting tooth of the cog-wheel on the fame axle, by which it urges round another wheel, exciting fimilar preffures on its pivots and on the acting tooth perhaps of a third wheel. -Thus a preffire is ultimately excited in the working point of the machine, perhaps a wiper, which lifts a heavy tamper, to let it fall again on lome matter to be pounded. Now ftatics teaches us the inter. fitics and direction of all thole preffures, and therefore how much remains at the working point of the machine unbalanced by refiftarice.
2. It comprehends every circumftance which influe ences the ftability of heavy bodies; the inveftigation and properties of the centre of gravity; the theory of the construction of arches, vaults, and domes; the attitudes of animals.
3. The ftrength of materials, and the principles of confruction, fo as to make the proper adjufment of ftrength and train in every part of a machine, edifice, or flruefure of any kind. Statics therefore furnifhes us with what may be called a theory of carpentry, and
gives us proper inftructions for framing floors, roofs, centres, \&c.
4. Statics comprehends the whole doftrine of the preffure of fluids, whether liquid or aeriform, whether arising from their weight or from any external action. Hence therefore we derive our knowledge of the fablity of flips, or their power of maintaining themfelves in a pofition nearly upright, in oppofition to the action of the wind on their fails. We learn on what circumitances of figure and flowage this quality depends, and what will augment or diminish it.

Very complete examples will be given in the remaining part of this work of the advantages of this feparate con!!deration of the condition of a machine at reft and in working motion ; and in what yet remains to be delivered of the hydraulic doctrines in our account of \(W_{A T E R-W o r k s ~ i n ~ g e n e r a l, ~ w i l l ~ b e ~ p e r c e i v e d ~ t h e ~ p r o p r i e t y ~}^{\text {a }}\) of fating apart the equilibrium which is indicated by the uniform motion of the fluid. The observations too which we have to make on the ftrength of the materats employed in our edifices or mechanical ftructures, will be examples of the inveftigation of thofe powers, preffures, or trains, which are excited in all their parts.

S L'ATISTICS, a word lately introduced to exprefs a view or furvey of any kingdom, county, or parish.

A Statiftical view of Germany was publifhed in 1790 by Mr B. Clarke; giving an account of the imperial and territorial conltitutions, forms of government, legifla. ton, adminiftration of juftice, and of the eccletialtical fate; with a fletch of the character and genius of the Germans ; a fort inquiry into the fate o their trade and commerce; and giving af distinct view of the domenoons, extent, number of inhabitants to a square mile ; chief towns, with their fire and population; revenues, expences, debts, and military ftrenyth of each fate. In Prufiia, in Saxony, Sardinia, and T'ufcany, attempts have allo been made to draw up ftatiftical accounts; but they were done rather with a view of afcertaining the prefent fate of there countries, than as the means of future inprovement.

A grand and extenfive work of this kind, founded on a judicious plan, conducted by the molt patiotic and enlightened motives, and drawn up from the communications of the whole body of the clergy, was undertaken in Scotland in the year 1790 by Sir John Sinclair of Ulbfter, one of the mott ufeful members of his country. Many praifes are heaped upon genius and learning; but to genius and learning no ?pplaufe is due, except when excited for the benefit of mankind: but gratitude and praife is due to him whole talents fine only in great undertakings, whole happinefs lems to comfit in patriotic exertions, and whole judgment is uniformly approved by his fuccefs. A work of this kind, fo important in its object, to comprehentive in its range, fo judicious in its plan, and drawn up by more than 900 men of literary education, many of them men of great genius and learning, mut be of immenfe value. Sixteen volumes octavo are already publifhed; and it is fuppofed that the work will be completed in two or three additional volumes.

The great object of this work is to give an accurate view of the fate of the country, its agriculture, its manufactures, and its commerce; the means of improvement, of which they are reflectively capable; the amount of the population of a fate, and the causes of its increafe

\section*{\(S\) T A}
[ 732 ]

\section*{S T A}

Statifics. or decreale; the manner in which the territory of a country is poffeffed and cultivated; the nature and amount of the various productions of the foil ; the value of the perfonal wealth or ftock of the inhabitants, and how it can be augmented; the difeafes to which the people are fubject, their caufes and their cure; the occupations of the people; where they are entitled to encouragement, and where they ought to be fuppreffed; the condition of the poor, the beft mode of maintaining them, and of giving them employment; the fate of fchools, and other inftitutions, formed for purpofes of public utility; theftate of the villages and towns, and the regulations beft calculated for their police and good government ; the ftate of the nianners, the monals, and the religious principles of the people, and the means by which their temporal and eternal interefts can beft be promoted.

To fuch of our readers as have not an opportunity of perufing this national work, or of examining its plan, we will prefent the fcheme for the flatiftical account of a- parochial diftrict which Sir John Sinclair publifhed for the confideration of the clergy, and which has been generally followed by them, though often with great improvements.

The name of the parifh and its origin; fituation and extent of the parifh; number of acres ; defcription of the fnil and fuiface; natue and extent of the fea-coaft; lakes, rivers, iflands, hills, rocks, caves, woods, orchards, \&c.; climate and difeafes; iuftances of longevity; flate of pioperty; number of proprietors; number of refiding proprietors; mode of cultivation; implements of hufbandry; manures; feedtime and liarveft; remarkable inftances of good and bad feafons; quantity and value of each fpecies of crop; total value of the whole produce of the diftrict ; total real and valued rent ; price of grain and provifions; total quantity of grain and other articles confumed in the parifh; wages and price of labour ; fervices, whether exacted or abolifhed; commerce; manufactures; manufactureot kelp, its amount, and the number of people employed in it; fifheries; towns and viliages; police; inns and alchoufes; roads and bridges; harbours; ferries, and theirftate; number of fhips and reffels; number of feamen; ftate of the church ; ftipend, manfe, glebe, and patron; number of poor ; parechial funds, and the management of them ; ftate of the fchools, and number of fcholas: ancient ftate of population ; caufcs of its increafe or decreafe; number of families; exaet amount of the number of fonls now living; divifion of the inhabitants; 1. by the place of their birth; 2. by their ages ; 3. by their relinious perfuafions; 4. by their occupations and fituation in life; 5 . by their refidence, whether in town, village, or in the country; number of houfes; number of uninhabited houfes; number of dore-cots, and to what extent they are deftructive to the crops; number of horfes, their nature and value; number of cattle, their nature and value; number of theep, their nature and value; number of fivine, their nature and value; minerals in gencral; mineral fprings; coal and fuel; eminent men; anticquities; parochial records; mifcellaneous obfervations; character of the people; their manuers, cuftoms, fiature, \&xc.; advantages and difadvantages; means by which their fituation could be meliorated.

If fimilar furvess (fays the public-\{pirited editor of this work) were inftituted in the other kingdoms of Europe, it might be the means of eftablifhing, on fure toundations, the principles of that moft important of all
fciences, viz. political or ftatiftical philofophy ; that is, the fcience, which, in preference to every other, ought to be held in reverence. No fcience can furnifh, to any mind capable of receiving ufeful iuformation, fo much real entertairment; none can yield fuch important hints, for the improvement of agriculture, for the extenfion of commercial induftry, for regulating the conduct of in dividuals, or for extending the prolperity of the ftate; none can tend fo muck to promote the general happinefs of the fpecies.

STATIUS (Publius Papinius), a celebrated Latin poet of the firt century, was born at Naples, and was the fon of Statius, a native of İpirus, who went to Rome to teach poetry and eloquence, and had Io. initian for his fcholar. Statius the poct alfo obsained the favour and friend/hip of that prince; and dedicated to him his Thebais and Achilleis; the firft in twelve books, and the laft in two. Ife died at Naples about the year 100 . Befides the abure poems, there are alfo ftill extant his Sylva, in five books; the ftyle of which is purer, more agreeable, and more natural, than that of his 'Thebais and Achilleis.

STATUARY, a branch of fculpture, cmployed in the making of fatues. See Sculpture and the next article.

Statuary is one of thofe ants wherein the ancients furpaffed the moderns; and indeed it was much more popular, and more cultivated, among the former than the latter. It is difputed between ftatuary and paint. ing, which of the two is the moft difficult and the moft artful.

Statuary is alfo ufed for the artificer who makes ftatues. Phidias was the greateft ftatuary among the ancients, and Michael Angelo amony the moderns.

S'CATUE, is defined to be a piece of fculpture in full relievo, reprefenting a human figure. Daviler more fcientifically defines ftatue a reprefentation, in high relievo and infulate, of fome perion diftinguifhed by his birth, merit, or great actions, placed as an ornament in a fine building, or expofed in a public place, to preferve the memory of hi worth. In Greece one of the higheft honours to which'a citizen could afpire was to obtain a flatue.

Statues are formed with the chifel, of feveral matters, as tone, inarble, plafter, \&c. They are alfo catt of various kinds of metal, particularly gold, filver, brafs, and lead. For the method of catting ftatues, fee the article Founderr of Statues.

Statues are ufually diftinguifhed into four general kinds. The firtt are thofe lefs than the life; of which kind we have feveral ftatues of great men, of kings, and of grods themfelves. The fecond arc thofe equal to the life; in which manner it was that the ancients, at the public expence, ufed to make fatues of perfons eminent for virtue, learning, or the fervices they had done. The third are thofe that exceed the life; among which thole that furpaffed the life once and a half were for kings and emperors ; and thofe double the life, for heroes. The fourth kind were thofe that excceded the life twice, thrice, and even more, and were called coloffufes. See Colossus.
Every ftatue refembling the perfon whom it is intended to reprefent, is called Jlatua iconica. Statues acquire various other denominations. 1. Thus, allegorical ftatue is that which, under a human figure, or other fymbol,

\section*{S T A}
[ 733 ]

\section*{S T E}
reprefents fomething of another kind; as a part of the earth, a feafon, age, element, temperament, hour, \&c. 2. Curule flatues, are thofe which are reprefented in chariots drawn by bigx or quadrigæ, that is", by two or four horfes; of which kind there were feveral in the circufes, hippodromes, \&c. or in cars, as we fee fome, with triumphal arches on antique medals. 3. Equeftrian ftatue, that which reprefents fome illuftrious perfon on horfeback, as that famous one of Marcus Aurelius at Kome; that of king Cliarles I. at Charing-crofs; King George II. in Leicefter.Square, \&c. 4: Greek fatue, denotes a figure that is naked and antique ; it being in this manner the Greeks reprefented their deities, athletæ of the olympic games, and heroes; the fatues of heroes were particularly called Achillcan fatues, by reafon of the great number of figures of Achilles in moft of the cities of Greece. 5. Hydraulic ftatue, is any figure placed as an ornament of a fountain or grotto, or that does the office of a jet d'eau, a cock, fpout, or the like, by any of its parts, or by any attribute it holds: the like is to be underfood of any animal ferving for the fame ufe. 6. Pedeftrian ftatue, a ftatue ftanding on foot; as that of king Charles II. in the Royal Exchange, and of king James II. in the PrivyGardens. 7. Roman fatue, is an appellation given to fuch as are clothed, and which receive various names from their various dreffes. Thofe of emperors, with long growns over their armour, were called fatue paludate: thofe of captains-and cavaliers, with coats of arms, thoracate; thofe of foldiers with cuiraffes, loricate; thofe of fenators and augurs, trabeate; thofe of magiftrates with long robes, togate; thofe of the people with a plain tunica, tunicate ; and, laftly, thofe of women with long trains, Roluta.

In repairing a ftatue caft in a mould, they touch it up with a clifel, graver, or other inftrument, to finifh the places which liave not come well off: they alfo clear off the barb, and what is redundant in the joints and projectures.

\section*{Stature. See Dwarf and Giant.}

STA'I'U'TE, in its general fenfe, fignifies a law, ordinance, decree, \&c. See Law, \&cc.

Statute, in our laws and cuftoms, more immediately fignifies an act of parliament made by the thice eflates of the realm; and fuch fatutes are either general, of which the courts at Weftminfter muft take notice without pleading them; or they are fpecial and private, which laft muft be pleaded.

ST'AVESACRE, in botany ; a fpecies of DelphiniUm.
STAY, a large ftrong rope employed to fupport the maft on the fore-part, by extending from its upper end towards the fore part of the fhip, as the fhrouds are extended to the right and left, and behind it. See Mast, Rigging, and Shroud.
The ftay of the fore-maft \(a\), fig. 3. plate CCLXXVI. which is called the foreffay, reaches from the mafthead towards the bowfprit-end : the main-ftay \(b\) extends over the forecaftle to the fhip's ftem; and the mizen-fay \(c\) is flretched down to that part of the mainmaft which lies immediately above the quarter-deck: the fore-top-maft ftay \(d\) comes allo to the end of the bowfirit, a little beyond the fore-ftay: the main-topmaft flay \(e\) is attached to the head or hounds of the fore-maft; and the mizen-top-maft flay comes alfo to
the hounds of the main-maft: the fore-top.gallant fay comes to the outer end of the jib-boom; and the main. top gallant ftay is extended to the head of the fore-topmatt.

Stay. Sail, a fort of triangular fail extended upon a fay. See Sail.

STEAM, is the name given in our language to the Definition. vifible moift vapour which arifes from all bodies which contain juices eafily expelled from them by lieats not fufficient for their combuftion. Thus we lay, the fteam of boiling water, of malt, of a tan-bed, \& c. It is'diftinguifhed from finoke by its not having been produced by combuftion, by not containing any foot, and by its being condenfible by cold into water, oil, inflammable fpirits, or liquids compofed of thefe.
We fee it rife in great abundance from bodies when Arpearso they are heated, forming a white cloud, which diffufes like a itfelf and difappears at no very great ditance from the white body from which it was produced. In this cafe the cluud furrounding air is found loaded with the water or other juices which feem to have produced it, and the fteam feems to be completely foluble in air, as falt is in water, compofing while thua united a tranfparent elaftic fluid.
But in order to its appearance in the form of an When difopaque white cloud, the mixture with or diffemination femnated in air feem abfolutely neceffary. If a tea-kettle boils is air. violently, fo that the fteam is formed at the fpout in great abundance, it may be obferved, that the vifible cloud is not formed at the very mouth of the fpout, but at a fmall diftance before it, and that the vapour is perfectly tranfparent at its firft emiffion. This is rendered fill more evident by fitting to the fpout of the tea.kettle a glafs pipe of any length, and of as large a diameter as we pleaie. 'I'he fteam is produced as copioufly as without this pipe, but the vapour is tranfparent through the whole length of the pipe. Nay, if this pipe communicate with a glafs veffel terminating in another pipe, and if the velfel be kept fufficiently hot, the fteam will be as abundantly produced at the mouth of this fecond pipe as before, and the veffel will be quite tranfparent. The vifibility therefore of the matter which conflitutes the fleam is an accidental or extrancous cincumftance, and requires the admixture with air; yet this quality again leaves it when united with air by folution. It appears therefore to require a dilfemination in the air. The appearances are quite agreeable to this notion: for we know that one perfectly tranfparent body, when minutely cívided and diffuied among the parts of another tranfparent body, but not diffolved in it, makes a mafs which is vifible. Thus oil beat up with water makes a white opaque mafs.

In the mean time, as fteam is produced, the water Is again gradually waftes in the tea kettle, and will foon be to-converted tally expended, if we continue it on the fire. It is rea- into waters fonable therefore to fuppofe, that this iteam is nothing but water changed by heat into an aerial or elaftic form. If \(f 0\), we fhould expect that the privation of this heat would leave it in the form of water again. Accordingly this is fully verified by experiment; for if the pipe fitted to the fpout of the tea-kettle be furround ed with cold water, no fteam will iffue, but water will continually trickle from it in drops; and it the procefs be conducted with the proper precautions, the water which we thus obtain from the pipe will be found
equal.

Steam. equal in quartity to that which difappears from the teakettle.
Its apfear-- This is evidently the common procefs for diftilling ; ances cx x- and the whole appearances may be explained by faying, plaii:ed, that the water is converted by heat into an elaflic vapour, and that this, meeting with colder air, imparts to it the heat which it carried off as it arofe from the heated water, and being deprived of its heat it is again water. The particles of this water being vafly more remote from each other than when they were in the teakettle, and thus being diffeminated in the air, become vifible, by reflecting light from their anterior and poterior furfaces, in the fame manner as a tranfparent falt becomes vifible when reduced to a fine powder. This diffeminated water being prefented to the air in a very extended furface, is quickly diffolved by it, as pounded falt is in water, and again becomes a tranfparent fluid, but of a different nature from what it was before, being no longer convertible into water by depriving it of its heat.
Accordingly this opinion, or fomething very like it, has been long entertained. Mulchenbroeck exprefsly

6
And the caure of its con Der Black's dif envery of

\section*{latent heat} with it all the heat which is continually tlirown in by the fuel. But Dr Black was the firt who attended minutely to the whole phenomena, and enabled us to form ditinct notions of the fubject. He har! difcovered -that it was not fufficient for converting ice into water that it be raifed to that temperature in which it can no - longer remain in the form of ice. A picce of ice of the temperature \(3^{\circ}\) of Fahrenheit's thermometer will remain a very long while in air of the temperature \(50^{\circ}\) before it be all melted, remaining all the while of the temperature \(32^{\circ}\), and therefore continually abforbing hear from the furrounding air. By comparing the time in which the ice had its temperature changed from \(28^{\circ}\) to \(32^{\circ}\) with the fubfequent time of its complete lique. faction, he found that it abforbed about 130 or 140 times as much heat as would raife its temperature one degree; and he found that one pound of ice, when mixed with one pound of water 140 degrees warmer, was jult melted, but without rifing in its temperature above \(32^{\circ}\). Hence he juftly concluded, that water differed from ice of the fame temperature by containing, as a conflituent ingredient, a great quantity of fire, or of the caufe of hear, united with it in fuch a way as rot to quit it for another colder body, and therefore fo as not to go into the liquor of the thermometer and ex. pand it. Confidered therefore as the pofible caufe of heat, it was latent, which Dr Black expreffed by the abbreviated term latent heat. If any more heat was added to the water it was not latent, but would readily quit it for the thermometer, and, by expanding the thermometer, would fhow what is the deyree of this redundant heat, while fluidity alone is the indication of the combined and latent heat.

Dr Black, in like manner, concluded, that in order to convert water into an elaftic vapour, it was neceffary, not only to increafe its uncumbined heat till its temperature is \(212^{\circ}\), in which flate it is juft ready to become elaftic ; but alfo to pour into it a great quantity of fire, or the caufe of heat, which combines with every particle of it, fo as to make it repel, or to recede from, its adjoining particles, and thus to make it a particle of an elaftic fluid. He fuppoled that this additional heat

\section*{7341 \\ S T E}
might be combined with it fo as not to quit it for the thermometer; and therefore fo as to be in a latent fate, having elaftic fluidity for its fole indication.

This opinion was very conliftent with the phenome-The fem non of boiling off a quantity of water. The applica- perature tion of heat to it caules it gradually to rife in its tem. produce perature till it reaches the temperature \(212^{\circ}\). It then and the begins to fend off elaltic vapour, and is flowly expend- quantity ed in this way, continuing all the while of the fame heat wh temperature. The fteam alfo is of no higher tempera. it abfoil ture, as appears by holding a thermometer in it. We muft conclude that this Iteam contains all the heat which is expended in its formation. Accordingly the fcalding power of fteam is well known; but it is extremely difficult to obtain precife meafures of the quantity of heat abforbed by water during its converfion into fteam. Dr Black endeavoured to afcertain this point, by comparing the time of raifing its temperature a certain number of degrees with the time of boiling it off by the fame external heat; and he found that the heat latent in fteam, which balanced the preffure of the atmofphere, was not lefs than 800 degrees. He alfo directed Dr Irvine of Glafyow to the form of an experiment for meafuring the heat actually extricated from fuch Iteam during its condenfation in the refrigeratory of a fill, which was found to be not lefs than 774 degrees. Dr Black was afterwards informed by Mr Watt, that a courfe of experiments, which he had made in each of thefe ways with great precifion, determined the latent heat of fteam under the ordinary preffure of the atmofphere to be about 948 or 950 degrees. Mr Watt alfo found that water would dittil with great eale in vacuo when of the temperature \(70^{\circ}\); and that in this cafe the latent heat of the fteam is not lefs than 1200 or 1300 degrees: and a train of experiments, which he had made by diftilling in différent temperatures, made him conclude that the fum of the fenfible and latent heats is a conftant quantity. This is a curious and not an improbable circumftance; but we have no information of the particulars of thefe experiments. The conclufion evidently prefuppofes a knowledge of that particular temperature in which the water has no heat; but this is a point which is ftill fub judice.
This converfion of liquids (for it is not confined to Steam water, but obtains alfo in ardent fpirits, oils, mercury, being cou 2 c .) is the caufe of their boiling. The heat is applied bined wit to the bottom and fiedes of the veffel, and gradually ac- heat, becumulates in the fluid, in a fenfible ftate, uncombined, comes el and ready to quit it and to enter into any body that islight, colder, and to diffufe itfelf between them. Thus it enters into the fluid of a thermometer, expands it, and thus gives ns the indication of the degree in which it has been accumulated in the water; for the thermome. ter fwells as long as it continues to abforb fenfible beat from the water: and when the fenfible heat in both is in equilibrio, in a proportion depending on the nature of the two fluids, the thernometer rifes 110 more, becaufe it abforbs no more heat or fire from the water; for the particles of water which are in immediate contact with the bottom, are now (by this gradual expanfion of liquidity) at fuch dittance from each other, that their laws of attraction for each other and for heat are totally changed Each particle eiiher no longer attracts, or perhaps it repels its adjoining particle, and now accu2 mulates round itfelf a great number of the particles of

\section*{S T E \\ [ 735 ] S T E}
am. heat, and forms a particle of elaftic fluid, fo related to the adjoining new formed particles, as to repel them to a diftance at leaft a hundred times greater than their diftances in the fate of water. Thus a mals of elatic vapour of fenfible magnitude is formed. Being at leaft ten thoufand times lighter than an equal bulk of water, it muft rife up through it, as a cork would do, in form of a tranfparent ball or bubble, and getting to the top, it diffipates, filling the upper part of the veffel with vapour or feam. 'Thus, by toffing the liquid into bubbles, which are produced all over the bottom and fides of the veffel, it produces the phenomenon of ebullition or beiling. Obferve, that during its paffare up through the water, it is not changed or condenfed; for the furrounding water is already fo hot that the fenfible or uncombined beat in it, is in equilibrio with that in the vapour, and therefore it is not difpofed to abforb any of that heat which is combined as an ingredient of this vapour, and gives it its elafticity. For this reafon, it happens that water will not boil till its whole mafs be heated up to \(212^{\circ}\); for if the upper part be colder, it robs the rifing bubble of that heat which is neceffary for its elafticity, fo that it immediately collapfes again, and the furface of the water remains ftill. This may be perceived by holding water in a Florence flank over a lamp or choffer. It will be obferved, fome time before the real ebullition, that fome bubbles are formed at the bottom, and get up a very little way, and then difappear. The diflances which they reach before collapfing increafe as the water continues to warm farther up the mafs, till at laft it breaks cut into boiling. If the handle of a tea-kettle be grafped with the hand, a tremor will be felt for fome little time before boiling, arifing from the little fuccuffions which are produced by the collapfing of the bubbles of vapour. This is much more violent, and is really a remarkable phenomenon, if we fuddenly plunge a lump of red hot iron into a veffel of cold water, taking care that no red part be near the furface. If the hand be now applied to the fide of the veffel, a moft violent tremor is felt, and fometimes ftrong thumps: thefe arife from the collapfing of very large bubbles. If the upper part of the iron be too hot, it warms the furrounding water fo much, that the bubbles from below come up through it uncondenfed, and pro. duce ebullition without this fuccuffion. The great refemblance of this tremor to the feeling which we have during the fhock of an earthquake has led many to fuppofe that thefe laft are produced in the fame
way, (See Earthouake, n\(n^{\circ} 88-98\) ); and their hy. pothef1s, notwithitanding the objections which we have elfewhere ftated to it, is by no means unfeafible.

It is owing to a fimilar caufe that violent thumps are The noif fometimes felt on the bottom of a tea-kettle, efpecially one nbfer ved in which has been long in ufe. Such are frequently cruft the boiling. ed on the bottom with a fony concretion. This fome of a teatimes is detached in little fcales. When one of thefe is plained. adhering by one end to the bottom, the water gets between them in a thin film. Here it may be heated confiderably above the boiling temperature, and it fuddeuly rifes up in a large bubble, which collapfes immediately. A fmooth fhilling lying on the bottom will produce this appearance very violently, or a thimble with the mouth down.

In order to make water boil, the fire muft be ap-Water will plied to the bottom or fides of the veffel. If the not boil unheat be applied at the top of the water, it will walte lefs the fire away without boiling; for the very fuperficial particles to the botare firf fupplicd with the heat neceffary for rendering tom or fises them elaftic, and they fly off without agitating the of the vefreft (A).
fel.
Since this difengagement of vapour is the effect of No fluid its elafticity, and fince this elafticity is a determined can boil till force when the temperature is given, it follows, that the elafticifluids cannot boil till the elafticity of the vapour over-ty of the comes the preffure of the incumbent fluid and of the at- vercome mofphere. Therefore, when this preffure is removed or vercome prefure diminifled, the fluids muft fooner overcome what re of the inmains, and boil at a lower temperature. Accordingly it cumbent is obferved that water will boil in an exhaufted receiver bodies. when of the heat of the human body. If two glafs. balls \(A\) and \(B\) (fig. 1.) be connected by a flender tube, and one of them \(A\) be filled with water (a fmall open-

Plate ing or pipe \(b\) being left at top of the other), and this be made to boil, the vapour produced from it will drive all the air out of the other, and will at laft come out itfelf, producing fleam at the mouth of the pipe. When the ball B is obferved to be occupied by tranfparent vapour, we may conclude that the air is completely expelled. Now faut the pipe by fticking it into a piece of tallow or bees-wax; the vapour in \(\overline{\mathrm{B}}\) will foon condenfe, and there will be a vacuum. 'l he flame of a. lamp and blow-pipe being directed to the little pipe, will caufe it immediately to clofe and feal hermetically. We now have a pretty inftrument or toy called a Pulse glass. Grafp the ball A in the hollow of the hand; the heat of the hand will immediately expand the bub-
(A) We explained the opaque and cloudy appearance of fteam, by faying that the vapour is condenfed by co. ming into contact with the cooler air. There is fomething in the form of this cloud which is very inexplicable. The particles of it are fometimes very diftinguifhable by the eye; but they have rot the fmart far like brilliancy, of very fmall drops of water, but give the fainter reflection of a very thin filin or veficle like a foap bubble. If we attend alfo to their motion, we fee them defcending very flowly in comparifon with the defeent of a folid? drop; and this veficular conftitution is eftablifhed beyond a doubt by looking at a candle through a cloud of fteam. It is feen furrounded by a faint halo with prifmatical colours, precifely fuch a we can demonftrate by optical laws to belong to a collection of veficles, but totally different frem the halo which would be produced by a collection of folid drops. It is very difficult to conceive how thefe veficles can be formed of watery particles, each of which was furrounded with many particles of fire, now communicated to the air, and low each of thefe veficles fhall include within it a ball of air ; but we cannot refufe the fact. We know, that if, while linfeedoil is boiling or nearly boiling, the furface be obliquely ftruck with the ladle, it will be dafhed into a prodigious number of exceedingly fmall veficles, which will float about in the air for a long while. Mr Sauffure was (we: think) the firft who diftinctly obferved this veficular form of mifts and clouds; and he makes confiderable ufe of it in explaining feveral phenomena of the atmofphere.

\section*{S T E}

Stcam,
 drive the water into \(B\), and then will blow up through it for a long while, keeping it in a fate of violent ebul. lition, as long as there remains a drop or film of water in \(A\). But care muft be taken that \(B\) is all the while kept cold, that it may condenfe the vapour as faft as it rifes through the water. Touching \(B\) with the liand, or breathing warm on it, will immediately flop the ebullition in it. When the water in A has thus been diffipated, grafp \(B\) in the hard; the water will be driven into \(A\), and the ebullition will take place there as it did in B. Putting one of the balls into the mouth will make the ebullition more violent in the other, and the one in the mouth will feel very cold. This is a pretty illuftration of, the rapid abforption of the heat by the particles of water which are thus converted into elaftic vapour. We have feen this little toy fufpended by the middle of the tube like a balance, and thus placed in the infide of a window, having two holes \(a\) and \(b\) cut in the pane, in fuch a fituation that when \(A\) is full of water and preponderates, \(B\) is oppolite to the hole \(b\). Whenever the room became fufficiently warm, the vapour was formed in A, and immediately drove the water into \(B\), which was kept cool by the air coming into the room through the hole \(b\). By this means B was made to proponderate in its turn, and \(A\) was then oppofite to the hole \(a\), and the procels was now repeated in the oppofite direction; and this amufement continued as long as the room was warm enough.
\({ }^{13}\) guors dif aiquorsdif- We know that liquors differ exceedingly in the tem\({ }^{3}\) or much in peratures neceffary for their ebullition. This forms the the ten- great chemical difinction between volatile and fixed boperature deceflary dies. But the difference of temperature in which they for their ebulition. boil, or are converted into permanently elaftic vapnur, under the preffure of the atmofphere, is not a certain meafure of their differences of volatility. The natural boiling point of a body is that in which it will be converted into elaftic vaponr under no preflure, or in vacuo. The boiling point in the open air depends on the law of the elafticity of the vapour in relation to its hear. A fluid A may be lefs volatile, that is, may require more heat to make it boil in vacuo, than a fluid B : But if the elafticity of the vapour of A be more increafed by an increafe of tempcrature than that of the vapour of \(\mathrm{B}, \mathrm{A}\) may boil at as low, or even at a lower temperature, in the open air, than B does; for the increafed elafticity of the vapour of A may fooner overcome the prcffure of the atmofphere. Few experiments have been made on the relation between the temperature and the elafticity of different vapours. So long ago as the year 1765 , we had occafion to examine the boiling points of all fuch liquors as we could manage in an air-pump; that is, fuch as did not produce vapours which deftroyed the valves and the leathers of the piftons: and we thought that the experiments gave us reafon to conclude, that the clafticity of all the vapours was affected by heat nearly in the fame degree. For we found that the dif ference between their boiling points in the air and in vacuo was neally the fame in all, namely, about 120 degrees lof Fahrenheit's thermomcter. It is exceedingly difficult to make experiments of this kind : The vaDours are fo condenfible, and change their elafticity fo prodigioully by a tilifing change of temperature, that it is almof impoffible to examine this point with precifwon. It is, however, as we fhall fee by and by, a fub.

\section*{S T E.}
ject of confiderable practical importance in the mechanic arts ; and an accurate knowledge of the relation would be of great ufe alfo to the diftiller : and it would be no lefs inportant to difcover the relation of their elafticity and denfity, by examining their compreffibility, in the fame manner as we have afcertained the relation in the cale of what we call aerial fuids, that is, fuch as we have never obferved in the form of liquids or folids, except in confequence of their mion with each other or with other bodies. In the article Pneumatics we took notice of it as fomcthing like a natural law, that all thefe airs, or gafes as they are now called, had their elafticity very nearly, if not exactly proportional to their denfity. This appears from the experiments of Achard, of Fontana, and others, on vital air, inflammable air, fixed air, and fome others. It gives us fome prefumption to fuppofe that it holds in all elaftic vapours whatever, and that it is connected with their elafticity; and it renders it fomewhat probable that they are all elaflic, only becaufe the caufc of heat (the matter of fire if you will) is elaftic, and that their law of elafticity, in refpect of denfity, is the fame with that of fire. But it mult \(\Gamma_{0}\) what be obferved, that although we thus affign the elafticity elafticit, of fire as the immediate caufe of the elafticity of vapour, flud, n in the fame way; and on the fame grounds, that we afrribe the fluidity of brine to the fluicity of the water which holds the folid falt in folution, it does not follow that this is owing, as is commonly fuppofed, to a repulfion or tendency to recede from each other exerted by the particles of fire. We are as much entitled to infer a repulfion of unlimited extent between the particles of water; for we fee that by its means a fingle particle of fea-falt becomes diffeminated through the whole of a very large veffcl. It water had not been a vifible and palpablc fubftance, and the falt only had been vifible and palpable, we might have formed a fimilar notion of chemical folution. But we, on the contrary, have confidered the quaquaverfum motion or expanfion of the falt as a diffemination among the particles of water; and we have afcribed it to the ftrong attraction of the atoms of falt for the atoms of water, and the attraction of thefe laft for each other, thinking that each atom of falt accumulates round itfelf a multitude of watery atoms, and by fo doing muft recede from the other falinc atoms. Nay, we farther fee, that by forces which we naturally confider as attractions, an expanfion may be produced of the whole mafs, which will act againtt external mechanical forces. It is thus that wood fwells with almoft infuperable force by imbibing moifure; it is thus that a fponge immeried in water becomes really an elaftic compreffible body, refembling a blown bladder; and there are appearances which warrant us to apply this mode of conception to elaftic fluids. When air is fuddenly compreffed, a thermometer in cluded in it fhows a rifc of temperature; that is, an appearance of heat now redundant which was formerly combined. The heat feems to be fqueezed out as the water from the fponge.

A ccordingly this opinion, that the elafticity of itcam Afrribe and other vapours is owing merely to the attraction for by fom fire, and the confequent diffemination of their particles through the whole mafs of fire, has been cntertained by many naturalifts, and it has been afcribed entirely to attraction. We by no means pretend to decide ; but we think the analogy by far too flight to found any

\section*{S T E [737] S T E}
ream. confident opision on it. The aim is to folve phenomena by attraction only, as if it were of more eafy concep. tion than repulfion. Confidered merely as facts, they are quite on a par. The appearances of nature in which we obferve actual receffes of the parts of body from each other, are as diftinet, and as frequent and familiar, as the appearances of actual approach. And if we attempt to go farther in our contemplation, and to conceive the way and the forces by which either the approximations or receffes of the atoms are produced, we mult acknowledge that we have no conception of the matter; and we can only fay, that there is a caufe of thefe motions, and we call it a force, as in every cafe of the production of motion. We call it attraction or repulfion juft as we happen to contemplate an accefs or a recefs. But the analogy here is not only flight, butt imperfect, and fails moft in thofe cafes which are moft fimple, and where we fhould expect it to be moft complete. We can fqueeze water out of a fponge, it is true, or out of a piece of green wood; but when the white of an egg, the tremella, or fome gums, fwell to a hundred times their dry dimenfions by imbibing water, we cannot fqueeze out a particle. If fluidity (for the reafoning muft equally apply to this as to vaporoufnefs) be owing to an accumulation of the extended matter of fire, which gradually expanded the folid by its very minute additions; and if the accumulation round a particle of ice, which is neceffary for making it a particle of water, be fo great in comparifon of what gives it the expanfion of one degree, as experiment obliges us to conclude-it feems an inevitable confequence that all fuids fhould be many times rarer than the folids from which they were produced. But we know that the dif. ference is triling in all cafes, and in fome (water, for inflance, and iron) the folid is rarer than the fluid. Many other arguments (each of them perhaps of little weight when taken alone, but which are all fyitematically connected) concur in rendering it much more probable that the matter of fire, in caufing elaticity, acts immediately by its own elafticity, which we cannot conceive in any other way than as a mutual tendency in its particles to recede from each other; and we doubt not but that, if it could be obtained alone, we fhould find it an claftic fluid like air. We even think that there are cafes in which it is obferved in this ftate. The elaftic force of gunpowder is very much beyond the elafticity of all the vapours which are produced in its deflagration, each of them being expanded as much as we can reafonably fuppofe by the great heat to which they are expofed. 'The writer of this article exploded fome gunpowder mixed with a conliderable portion of tinely powdered quartz, and another parcel mixed with fine filings of copper. The elafticity was meafured by the penetration of the ball which was difcharged, and was great in the degree now mentioned. 'The experiment was fo conducted, that mucl of the quartz and copper was collected; none of the quartz had been melted, and fome of the copper was not melted. The heat, therefore, could not be fuch as to explain the elafticity by expanfion of the vapours; and it became not improbable that fire was acting here as a detached chemical fluid by its own elafticity. But to return to our fubject.
There is one circumftance in which we think our own experiments fhow a remarkable difference (at leatt in degree) between the condenfible and incondenfible

Vob. XVII. Part II.
vapours. It is well known, that when air is very fud. denly expanded, cold is produced, and heat when it is fuddenly condenfed. When making experiments with fuddenly condenfed. When making experiments with Probably elafticity and denfity of the vapours of boiling water, ference be* and alfo of boiling fpirits of turpentine, we found the \({ }^{\text {tween cons }}\) change of denfity accompanied by a change of tempe denfible rature vafly greater than in the cafe of incoercible gafes. denfible va. When the vapour of boiling water was fuddenly allow- pours ; ed to expand into five times its bulk, we obferved the depreffion of a large and fenfible air thermometer to be at leaft four or five times greater than in a fimilar expanfion of common air of the fame temperature. The chemical reader will readily fee reafons for expecting, on the contrary, a fmaller alteration of temperature, both on account of the much greater rarity of the fluid, and on account of a partial condenfation of its water, and the confequent difengagement of combined heat.

This difference in the quantity of fire which is com- And allo bined in vapours and gafes is fo confiderable as to au-fome difthorize us to fuppofe that there is fome difference in the ference in chemical confitution of vapours and gafes, and that the the chemis connection between the feccific bafes of the vapourand the cal conftifire which it contains is not the fame in air, for inftance, vapour. as in the vapour of boiling water ; and this difference may be the reafon why the one is eafily condenfible by cold, while the other has never been exhibited in a liquid or folid form, except by means of its chemical union with other fubftances. In this particular inftance we know that there is an effential difference-that in vital or atmofpheric air there is not only a prodigious quantity of fire which is not in the vapour of water, but that it alfo contains light, or the caufe of light, in a combined ftate. This is fully evinced by the great difcovery of Mr Cavendifh of the compofition of water. Here we are taught that water (and confequently its vapour) confifts of air from which the light and greateft part of the fire have been feparated. And the fubfequent difcoveries of the celebrated Lavoifier fhow, that almoft all the condenfible gafes with which we are acequainted confift either of airs which have already lof much of their fire (and perhaps light too), or of matters in which we have no evidence of fire or light being combined in this manner.

This confideration may go far in explaining this difo ference in the condenfibility of thefe different fpecies of aerial fluids, the gafes and the vapours; and it is with this qualification only that we are difpofed to allow that all bodies are condenfible into liquids or folids by abflracting the heat. - In order that vital air may become liquid or folid, we hold that it is not fufficient that a body be prefented to it which flall fimply ab\&ract its heat. 'I'his would only abftract its uncombined fire.But another, and much larser portion remains chemically combined by means of light. A chemical affinity mult be brought into acion which may abitract, not the fire from the oxygen (to fpeak in the language of Mr Lavoifier), but the oxygen from the fire and liyht. And our production is not the detached bafs of air, but detached heat and light, and the formation of an oxyd of fome kind.

To profecute the chemical confideration of Steams General farther than thefe general obfervations, which are ap-OBSERAA plicable to all, would be almoft to write a treatife of Tions. chemiftry, and would be a repetition of many things which have been treated of in fufficient deteril in other

Steam rifes at different temperatures, ac. cording as the air is teavy or light,
articles of this work. We fhall therefore conclude this article with fome other obfervations, which are alfo oeneral, with refpect to the different kinds of coercible vapours, but which have a particular relation to the following article.

Steam or vapour is an elaftic fluid, whofe elafticity balances the preffure of the atmofphere; and it has been produced from a folid or liquid body raifed to a fufficient temperature for giving it this elafticity; that is, for caufing the fluid to boil. This temperature muft vary with the preffure of the air. Accordingly it is found, that when the air is light (indicated by the barometer being low), the fluid will boil fooner. When the barometer ftands at 30 inches, water boils at the temperature \(212^{\circ}\). If it fand fo low as 28 inches, water will boil at \(208 \frac{1}{2}\). In the plains of Quito, or at Gondar in Abyffinia, where the barometer ftands at about 21 inches, water will boil at \(195^{\circ}\). Highly rectified alcohol will boil at \(160^{\circ}\), and vitriolic æther will boil at \(88^{\circ}\) or \(89^{\circ}\). This is a temperature by no means uncommon in thefe places; nay, the air is frequently warmer. Vitriolic æther, therefore, is a liquor which can hardly be known in thofe countries. It is hardly poffible to preferve it in that form. If a phial have not its ftopper firmly tied down, it will be blown out, and the liquor will boil and be diffipated in fteam. On the top of Chimboracao, the human blood mult be difpofed to give out air-buibles.

We faid fome time ago, that we had concluded, from fome experiments made in the receiver of an air-pump, that fluids boil in vacuo at a temperature nearly 120 degrees lower than that neceffary for their boiling in the open air. But we now fee that this muft have been but a grofs approximation; for in thefe experiments the fluids were boiling under the preffure of the vapour which they produced, and which could not be abftract. ed by working the pump. It appears from the experi. ments of Lord Charles Cavendifh, mentioned in the ar. ticle Pneumatics, that water of the temperature \(72^{\circ}\) was converted into elaftic vapour, which balanced a preffure of \({ }_{4}^{3}\) ths of an inch of mercury, and in this fate it occupied the receiver, and did not allow the mercury in the gauge to fink to the level. As faft as this was abftracted by working the air-pump, more of it was produced from the furface of the water, fo that the preffure continued the fame, and the water did not boil. Had it been poffible to produce a vacuum above this water, it would have boiled for a moment, and would even have continued to boil, if the, receiver could have been kept very cold.

Upon reading thefe experiments, and fome very curious ones of Mr Nairne, in the Phil. Tranf. vol. 1xvii. the writer of this article was induced to examine more particularly the relation between the temperature of the vapour and its elafticity, in the following manner:

ABCD (fig. 2.) is the fection of a fmall digefter made of copper. Its lid, which is faftened to the body with fcrews, is pierced with three holes, each of which had a fmall pipe foldered into it. 'The firft hole was furnifhed with a brafs fafety-valve V , nicely fitted to it by grinding. The area of this valve was exactly \(\frac{x}{4}\) th of an inch. There refted on the ftalk at top of this valve the arm of a fteelyard carrying a fliding weight. 'lhis arm had a fcale of equal parts, fo adjufted to the weight that the number on the fcale correfponded to the inches of mercury, whofe preffure on the under furface of the
valve is equal to that of the fteclyard on its top; fo that when the weight was at the divifion 10 , the preffure of the fteelyard on the valve was jult equal to that of a column of mercury 10 inches high and \({ }_{4}^{x}\) th of an inch bafe. The middle hole contained a thermometer ' T firmly fixed into it, fo that no vapour could efcape by its fides. 'The ball of this thermometer was but a little way below the lid. The third hole received occafionally the end of a glafs-pipe S G F, whofe defeending leg was about 36 inches long. When this fyphon was not ufed, the hole was properly fhut with a plug.

The veffel was half filled with diftilled water which had been purged of air by boiling. The lid was then fixed on, having the third hole \(S\) plugged up. A lamp being placed under the veffel, the water boiled, and the fteam iffued copioufly by the fafety-valve. The thermometer ftood at 213 , and a barometer in the room at 29,9 inches. The weight was then put on the fifth divifion. The thermometer immediately began to rife; and when it was at 220 , the fteam iffued by the fides of the valve. The weight was removed to the roth divifion; but before the thermometer could be diftinctly obferved, the fteam was iffuing at the valve. The lamp was removed farther from the bottom of the veffel, that the prorrefs of heatiag might be more moderate; and when the fteam ceafed to iffue from the valve, the thermometer was at 227 . The weight was now fhifted to 15 ; and by gradually approaching the lamp, the fteam again iffued, and the thermometer was at \(132 \frac{7}{2}\). This mode of trial was continued all the way to the \(75^{\text {th }}\) divifion of the fale. The experiments were then repeated in the contrary order; that is, the weight being fufpended at the \(75^{\text {th }}\) divifion, and the fteam iffuing Atrongly at the valve, the lamp was withdrawn, and the moment the fteam ceafed to come out, the thermometer was obferved. The fame was done at the 7 oth, 65 th, divifion, \&c. Thefe experiments were feveral times repeated both ways; and the means of all the refults for each divifion are expreffed in the following table, where column ift exprefles the elafticity of the feam, being the fum of 29,9, and the divifion of the fteclyard; co. lumn 2 d expreffes the temperature of the feam correfponding to this elafticity.
\begin{tabular}{ll}
1. & II \\
35 & inches. \\
40 & \(219^{\circ}\) \\
45 & 226 \\
50 & 232 \\
55 & 237 \\
60 & 242 \\
65 & 247 \\
70 & 251 \\
75 & 255 \\
80 & 259 \\
85 & 263 \\
90 & 267 \\
95 & \(270^{\frac{1}{2}}\) \\
100 & \(274 \frac{1}{2}\) \\
105 & 278 \\
\hline 105 & 281
\end{tabular}

A very different procefs was neceffary for afcertaining the elafticity of the fteam in lower temperatures, and confequently under fmalier preffures than that of the atmofphere. The glafs fyphon SGF was now fixed irrto its hole in the lid of the digefter. The water was made to boil fmartly for fome time, and the fteam iffued copioully both at the valve and at the fyphon. The

\section*{S T E [ 739 ] S T E}

Stesm. lower end of the fyphon was now immerfed into a broad faucer of mercury, and the lamp inftantly removed, and cvery thing was allowed to grow cold. By this the feam was gradually condenfed, and the mercury rofe in the fyphon, without fenfibly finking in the faucer. The valve and all the joints were fmeared with a thick clammy cement, compofed of oil, tallow, and rofin, which effectually prevented all ingrefs of air. The weather was clear and frofty, the barometer ftanding at 29,84 , and the thermometer in the veffel at \(42^{\circ}\). The mercury in the fyphon food at 29,7 , or fomewhat higher, thus fhowing a very complete condenfation. The whole veffel was furrounded with pounded ice, of the temperature \(3^{\circ}\). This made no fenfible change in the height of the mercury. A mark was now made at the furface of the mercury. One obferver was fationed at the thermometer, with inftructions to call out as the thermometer reached the divifions \(42,47,5^{2}\), 57 , and fo on by every five degrees till it fhould attain the boiling heat. Another obferver noted the correfponding defeents of the mercury by a fcale of inches, which had its beginning placed at 29,84 from the furface of the mercury in the faucer.

The pounded ice was now removed, and the lamp placed at a conficerable diftance below the veffel, fo as to warm its contents very flowly. Thefe obfervations being very eafily made, were feveral times repeated, and their mean refults are fet down in the following table : Only obferve, that it was found difficult to note down the defcents for every fifth degree, becaufe they fucceeded each other fo faft. Every roth was judged fuf. ficient for eftablifhing the law of variation. The firt column of the table contains the temperature, and the fecond the defcent (in inches) of the mercury from the mark 29,84 .
\begin{tabular}{ll}
\(32^{\circ}\) & \multicolumn{1}{c}{\(\%\)} \\
40 & 0,1 \\
50 & 0,2 \\
60 & 0,35 \\
70 & 0,55 \\
80 & 0,82 \\
90 & 1,18 \\
100 & 1,61 \\
110 & 2,25 \\
120 & 3,00 \\
130 & 3,95 \\
140 & 5,15 \\
150 & 6,72 \\
160 & 8,65 \\
170 & 11,05 \\
180 & 14,05 \\
190 & 17,85 \\
200 & 22,62 \\
210 & 28,65
\end{tabular}

Four or five numbers at the top of the column of elafticities are not fo accurate as the others, becaufe the mercury paffed pretty quickly through thefe points. But the progrefs was extremely regular through the remaining points; fo that the elafticities correfponding to temperatures above \(70^{\circ}\) may be confidered as very accurately afcertained.

Not being altogether fatisfied with the method employed for meafuring the elatticity in temperatures above that of boiling water, a better form of experiment was adopted. (Indeed it was the want of other apparatus which made it neceffary to employ the former). A glafs
tube was procured of the form reprefented in fig. 3. having a little ciftern \(L\), from the top and bottom of which proceeded the fyphons. \(K\) and \(M N\). The ciftern contained mercury, and the tube MN was of a flender bore, and was about fix feet two inches long. The end K was firmly fixed in the third hole of the lid, and the long leg of the fyphon was furnifhed with a fcale of inches, and firmly faftened to an upright poft.

The lamp was now applied at fuch a diftance from the veffel as to warin it flowly; and make the water boil, the feam efcaping for fome time through the fafety valve. A heavy weight was then fufpended on the fteelyard; fuch as it was known that the veffel would fupport, and at the fame time, fuch as would not allow the fteam to force the mercury out of the long tube. The thermometer began immediately to rife, as alfo the mercury in the tube MN. Their correfpondent fations are marked in the following table:
\begin{tabular}{cc} 
Temp. & Elafty \\
2129 & 0,0 \\
220. & 5,9 \\
230 & 14,6 \\
240 & 25,0 \\
250 & 36,9 \\
260 & 50,4 \\
270 & 64,2 \\
280 & 106,0
\end{tabular}

This form of the experiment is much more fufceptible of accuracy than the other, and the meafures of elafticity are more to be depended on. In repeating the experiment, they were found much more conftant; whereas, in the former method, differences occurred of two inches and upwards.

We may now connect the two fets of experiments into one table, by adding to the numbers in this laft table the conftant height 29,9 , which was the height of the mercury in the barometer during the laft fet of obfer* vations.
\begin{tabular}{cc} 
Temp. & Elaft. \\

Which a-
gree well
with thofe of Mr A. chard.

In the memoirs of the Royal Academy of Berlin for 1782, there is an account of fome experiments made by Mr Achard on the elaftic force of fteam, from the temperature \(32^{\circ}\) to 212 . They agree extremely well with thole mentioned here, rarely differing more than two or three tenths of an inch. He alfo examined the elafticity of the vapour produced from alcohol, and found, that when the elafticity was equal to that of the vapour of water, the temperature was about \(35^{\circ}\) lower. Thus, when the elafticity of both was meaiured by 28,1 inches of mercury, the temperature of the watery vapour was \(209^{\circ}\), and that of the firituous vapour was. \(173^{\circ}\). When the elaflicity was 18,5 , the temperature of the water was 189,5 , and that of the alcohol 154,6 . When the elafticity was 11,05 , the water was \(168^{\circ}\), and the alcoliol \(134^{\circ}, 4\). Obferving the difference between the temperatures of equally elaf tic vapours of water and alcohol net to be conftant, but gradually to diminifh, in Mr Achard's experiments, along with the elafticity, it became intereiting to difcover whether and at what temperature this difference would vanifh altogether. Experiments were accordingly made by the writer of this article, fimilar to thofe made with water. 'They were not made with the fame fcrupulous care, nor repeated as they deferved, but they furnifhed rather an unexpected refult. The following table will give the reader a diftinct notion of them :
\begin{tabular}{cc} 
Temp. & Elaft. \\
320 & 0,0 \\
40 & 0,1 \\
60 & 0,8 \\
80 & 0,8 \\
100 & 3,9 \\
120 & 6,9 \\
140 & 12,2 \\
160 & 21,3 \\
180 & 34, \\
200 & 52,4 \\
220 & 78,5 \\
240 & 115,
\end{tabular}

An unex. pected repected reparing the tcmperatures of \(e\) tures of e-
qually elaf. tic vapours andalcohol

We fay that the refult was unexpected ; for as the natural boiling point feemed by former experiments to be point in the ordinary prefure more below their boiling point in the ordinary prefure of the atmofphere, it was reafonable to expect that the temperature at which they ceafed to emit fenfibly elaftic fteam would have fome relation to their temperatures when emitting feam of any determinate elafticity. Now as the vapour of alco. hol of elafticity 30 has its temperature about \(36^{\circ}\) lower than the temperature of water equally elaftic, it was to be expected that the temperature at which it ceafed to be fenfibly affected would be feveral degrees lower than \(32^{\circ}\). It is evident, however, that this is nut the cafe. But this is a point that deferves more attention, becaufe it is clofely connected with the chemical relation between the element (if fuch there be) of fire and the bodies into whofe compofition it feems to enter as a conftituent part. What is the temperature \(32^{\circ}\), to make it peculiarly connected with elaflicity ? It is a temperature affumed by us for our own conveniency, on account of the familiarity of water in our experiments. . .ther, we know, boils in a temperature far below this, as appears from Dr Cullen's experiments narrated in the Effays Phyfical and Literary of Edinburgh. On the faith of former experiments, we may be pretty certain that it will boil in vacuo as the tem.
perature \(-14^{\circ}\), becaufe in the air it boils ar \(+1060^{\circ}\). Therefore we may be certain, that the fleam or vapour of xther, when of the temperature \(32^{\circ}\), will be very fenfibly elaftic. Indeed Mr Lavoifier fays, that is it be expofed in an exhaufted receiver. in winter, its vapour will fupport mercury at the height of 10 inches. A feries of experiments on this vapour fimilar to the above would be very inftructive. We even with that thofe on alcohol were more carefully repeated. If we draw a curve line, of which the ablciffa is the line of temperatures, and the ordinates are the correfponding heights of the mercury in thefe experiments on water and alcohol, we fhall obferve, that although they both fentibly coincide at \(3^{2}\), and have the abfiffa tor their common tangent, a very fmall error of obfervation may be the caufe of this, and the curve which expreffes the elaticity of fpirituous vapour may really interfect the other, and go backwards confiderably beyond \(32^{\circ}\).

This range of experiments gives rife to fome curious The \({ }^{25}\) and important reflections. We now lee that no parti- periments cular temperature is neceffary for water affuming the give rife form of permanently elaftic vapour; and that it is high. reflection ly probable that it affumes this form even at the temperature \(32^{\circ}\); only its clafticity is too fmall to afford us any fenfible meafure. It is well known that even ice evaporates (fee experiments to this purpofe by Mr Wil. fon in the Philofophical Tranfactions, when a piece of polifhed metal covered with hoar.froft became peefectly clear by expofing it to a dry frolty wind).

Even mercury evaporates, or is converted into elaftic vapour, when all external preffure is removed. 'The dim film which may frequently be obferved in the upper part of a barometer which ftands near a ftream of air, is found to be fmall globules of mercury fticking to the infide of the tube. They may be feen by the help of a magnifying glafs, and are the beft teft of a well made barometer. They will be entirely removed by cauling the mercury to rife along the tube. It will lick them all up. They confift of mercury which had evaporated in the void fpace, and was afterwards condenfed by the cold glafs. But the elatticity is too fmall to occafion a fenfible depreffion of the column, even when confiderably warmed by a candle.

Many philofopleers accordingly imagine, that fpontaneous evaporation in low temperatures is produced in this way. But we caunot be of his ousion and ovape ftill think that this kind of evaporation is produced ration pro Whon is produced by duced by denly rarefied, there is always a prec moint air is fud- ving pow This is moft diftinctly feen when we work an air-pump of the air brifkly. A mitt is produced, which we fee plainly fall to the bottom of the receiver. But by this new doctrine the very contrary fhould happen, becaufe the tendency of water to appear in the elaftic form is promoted by removing the external preffure; and we really imagine that more of it now actually becomes fimple elaftic watery vapour. But the milt or precipitation Thows incontrovertibly, that there had been a previoug folution. Solution is performed by forces which act in the way of attraction; or, to exprefs it more fafely, folutions are accompanied by the mutual approaches of the particles of the menfruum and folvend : all fuch tendencies are obferved to increafe by a diminution of distance. Hence it muft follow, that air of double denfity will diffolve more than twice as much water. Therefore when we fuddenly rarefy faturated air (even the \({ }^{*}\)

\section*{S T E}
its heat fhould not diminifh) fome water muft be let go. What may be its quantity we know not ; but it may be more than what would now become elaftic by this diminution of furrounding preffure ; and it is not unlikely but this may have fome effect in producing the veficles which we found fo difficult to explain. Thefe may be filled with pure watery vapour, and be floating in a fluid compoled of water diffolved in air. An experiment of Fontana's feems to put this matter out of doubt. A diftiling apparatus AB (fig. 4.) was fo contrived, that the heat was applied above the furface of the wate: in the alembic -A . This was done by inclofing it in another veffel CC , filled with hot water. In the receiver \(B\) there was a fort of barome. ter D , with an open ciftern, in order to fee what preflure there was on the furface of the fluid. While the receiver and alembic contained air, the heat applied at A produced no fenfible diftillation during feveral hours: But on opening a cock E in the receiver at its bottom, and making the water in the alembic to boil, fleam was produced which foon expelled all the air, and followed it through the cock. The cock was now fhut, and the whole allowed to grow cold by removing the fire, and applying cold water to the alembic. The batometer fell to a level nearly. Then warm water was allowed to get into the outer veffel CC. The bayometer rofe a little, and the diftillation went on brifkly without the fmalleft ebullition in the alembic. The con clution is obvious : while there was air in the receiver and communicating pipe, the diftillation proceeded entirely by the diffolving power of this air. Above the water in the alembic it was quickly faturated; and this faturation proceeded flowly along the ftill air in the communicaing pipe, and at laft might take place thro' the whole of the receiver. The fides of the receiver being kept cold, fhould condenfe part of the water diffolved in the air in contact with them, and this fhould trickle down the fides and be collected. But any perfon who has obferved how long a cryftal of blue vitriol will lie at the bottom of a glafs of fill water before the tinge will reach the furface, will fee that it muft be next to impoffible for diftillation to go on in thefe circumitances; and accordingly noue was obferved. But when the upper part of the apparatus was filled with pure watery vapour, it was fapplied from the alembic as fatt as it was condenfed in the receiver, juft as in the pulle glafs.

Another inference which may be drawn from thefe experiments is, that Nature feems to affect a certain flaw in the dilaration of aeriform fluids by heat. They feem to be dilatable nearly in proportion of their prefent dilatation. For if we fuppofe that the vapourss refemble air, in having their elafticity in any given temperature proportional to their denlity, we nult fuppofe that if feam of the elafticity 60 , that is, fupporting 60 inches of mercury, were fubjected to a preffure of 30 inches, it would expand into twice its prefent bulk. The augmentation of elafticity therefore is the meafure of the bulk into which it would expand in order to acquire its former elafticity. Taking the increafe of elafticity therefore as a meafure of the bulk into which it would expand under one conftant preffure, we fee that equal increments of temperature pro. duce nearly equal multiplications of bulk. Thus if a certain dimiation of temperature diminifhes its bulk

\section*{\(741]\) S T E}
\(\frac{x}{4}\) th, another equal diminuti \(n\) of temperature will diminifh this new bulk th very nearly. Thus, in our experiments, the temperatures \(110^{\circ}, 140^{\circ} 170^{\circ}, 200^{\circ}\), \(230^{\circ}\), are in arithmetical progreffion, having equal differences; and we fee that the correfponding eldfticities \(2,25,5,15,11,05,22,62,44,7\), are very neally in the continued proportion of 1 to 2 . The elafticity correfponding to the temperature 2.60 deviates confiderably from this law, which would give 83 or 89 inttead of 8, ; and the deviation increafes in the higher temperatures. But till we fee that there is a confiderable approximation to this law; and it will frequently affift us to recollect, that whatever be the prefent temperature, an increafe of 30 degrees doubles the elafticity and the bulk of watery vapour.

This is fufficiently exact for moft practical purpofes. Thus an engineer finds that the injection cools the cylinder of a fteamengine to \(192^{\circ}\). It therefore leaves a fteam whole elafticity is \(\frac{3}{5}\) ths of its full elalticity, \(=18\) inches ¢ . But it is better at all times to have recourfe to the table. Obferve, too, that in the lower temperatures, i.e. below \(110^{\circ}\), this increment of temperature does more than double the elafticity.

This law obtains more remarkably in the incoercible vapours ; fuch as vital air, atmofoheric air, fixed air, \&c. all of which hàve alfo their elafticity proportional markably to their bulk inverfely : and perhaps the deviation from ir the incos the law in tteams is connccted with their chemical dif- pours, ference of contitution. If the bulk were always aug. mented in the fame proportion by equal augmentations of temperature, the elafticities would be accurately reprefented by the ordinates of a logarithmic curve, of which the temperatures are the correfponding abfciffie: and we might contrive fuch a fcale for onr thermometer, that the temperatures would be the common logarithms of the elafticities, or of the bulks having equal eladicity; or, with our prefent fcale, we may find fuch a multiplier \(m\) for the number \(\propto\) of degrees of our thermometer (above that temperature where the elafticity is equal to unity), that this multiple fhall be the common logarithm of the elafticity \(y\); fo that \(m x=\log \cdot y_{0}\)

But our experiments are not fufficiently accurate for determining the temperature where the elafticity is meafured by 1 inch; becaule in thefe temperatures the elalticities vary by exceedingly finall quantities. But if we take 11,04 for the unit of elafticity, and number: our temperature from \(170^{\circ}\), and make \(m=0,010035\), we thall find the product \(m x\) to be very nearly the logarithm of the elatticity. The deviations, however, from this law, are too great to make this equation of any ufe. But it is very practicable to frame an equation which flall correfpond with the experiments to any degree of accuracy; and it has been done for air in a tranflation of Gencral Roy's Meafurement of the Bafe at Hounflow Heath into French by Mr Prony. It is as follows: Let \(x\) be the degrees of Reaumur's

\section*{S T E [742] S T' E}
seeart. thernometer ; let \(y\) be the expanfion of 10,000 parts of air ; let \(e\) be \(=10, m=2,7976, n=0,01768\) : then \(y=t^{m+n x}-627,5\). Now \(e\) being \(=10\), it is plain that \(e^{m+n x}\) is the number, of which \(m+n x\) is the common logarithm. This formula is very exact as far as the temperature \(60^{\circ}\) : but beyond this it needs a correction; becaufe air, like the vapour of water, does not expand in the exact proportion of its bulk.

We obferve this law confiderably approximated to in the augmentation of the bulk or elafticity of elaftic vapours; that is, it is a fact that a given increment of temperature makes very nearly the fame proportional augmentation of bulk and elafticity. This gives us fome notion of the manner in which the fuppofed expanding caufe produces the effeet. When vapour of the builk 4 is expanded into a bulk 5 by an addition of 10 degrees of fenfible heat, a certain quantity of fire goes into it, and is accumulated round each particle, in fuch a manner that the temperature of each, which formerly was \(m\), is now \(m+10\). Let it now receive another equal augmentation of temperature. This is now \(m+2 \mathrm{C}\), and the bulk is \(\frac{5 \times 5}{4}\) or \(6_{4}^{\frac{1}{4}}\), and the arithmetical increafe of bulk is \(\frac{1}{4}\). The abfolute quantity of fire which has entered it is greater than the former, both on account of the greater augmentation of fpace and the greater temperature. Confequently if this vapour be compref. fed into the bulk 5, there muft be heat or fire in it which is not neceffary for the temperature \(m+20\), far lefs for the temperature \(m+10\). It muft therefore emerge, and be difpofed to enter a thermometer which has already the temperature \(m+20\) : that is, the vapour muft grow hotter by compreffion; not by fqueezing out the heat, like water out of a fponge, but becaufe the law of attraction for heat is deranged. It would be a very valuable acquifition to our knowledge oo learn with precifion the quartity of fenfible heat produced in this way; but no fatisfactory experiments have yet been made. M. Lavoifier, with his chemical friends and colleagues, were bufily employed in this inquiry; but the wickednefs of their countrymen has deprived the world of this and many other important additions which we might have expected from this celebrated and unfortunate philofopher. He had made, in conjunction with M. de la Place, a numerous train of accurate rand expenfive experiments for meafuring the quantity of latent or combined heat in elaftic vapours. 'I'his is evidently a very important point to the diftiller and practical chemif. This heat muft all come from the
fuel ; and it is greatly worth while to know whether any faving may be made of this article. Thus we know that diftillation will go on either under the preffure of the air, or in an alembic and receiver from which the air has been expelled by fteam; and we know that this laft may be conducted in a very low temperature, even not exceeding that of the human body. But it is uncertain whether this may not employ even a greater quantity of fucl, as well as occafion a great expence of time. We are difpofed to think, that when there is no air in the apparatus, and when the condenfation can be fpeedily performed; the proportion of fuel expended to the fluid which comes over will diminifh continually as the heat, and confequently the derfity of the fteam, is augmented; becaufe in this cafe the quantity of com. bined heat muft be lefs. In the mean time, we earneft. ly recommend the trial of this mode of diftillation in veffels cleared of air. It is undoubtedly of great advantage to be able to work with fmaller fires; and it would fecure us againt all accidents of blowing off the head of the ftill, often attended with terrible confequences (B).

We muft not conclude this article without taking notice of fome natural phenomena which feem to owe their origin to the aotion of elaftic fteam.

We have already taken notice of the refemblance of the tremor and fuccuffions obferved in the fhocks of many earthquakes to thofe which may be felt in a veffel where water is made to boil internally, while the breaking out of the ebullition is ftifled by the cold of the upper parts; and we have likewife ftated the objections which are ufually made to this theory of earthquakes. We may perhaps refume the fubject under the article Volcano; but in the mean time we do not hefitate to fay, that the wonderful appearances of the Geyzer fpring in Iceland (fee Huer; and Iceland, \(\mathrm{n}^{\circ} 3-5\). ) are undoubtedly produced by the expanfion of team in ignited caverns. Of thefe appearances we fuppofe the whole train to be produced as follows.

A cavern may be fuppofed of a fhape analogous to Explans CBDEF (fig. 5.), having a perpendicular funnel AB tron of th iffuing from a depreffed part of the roof. The part Fphenome may be lower than the reft, remote, and red-hot. Such of the \(G\) places we know to be frequent in Iceland. Water may in Icelar be continually trickling into the part CD. It will fill by the it up to B , and even up to \(\mathrm{E} e\), and then trickle flowly force of along into F . As foon as any gets into contact with feam. an ignited part, it expands into elaftic fteam, and is partly condenfed by the cold fides of the cavern, which it gradually warms, till it condenfes no more. This
produc
(B) We eameftly recommend this fubject to the confideration of the philofopher. The laws whicl regulate the formation of elaftic vapour, or the general phenomena which it exhibits, give us that link which connects chemiftry with mechanical philofophy. Here we fee chemical affinities and mechanical forces fet in immediate oppolition to each other, and the one made the indication, characteriftic, and meafure of the other. We have not the leaft doubt that they make but one fcience, the Science of Univerfal Mechanics; nor do we defpair of feeing the phenomena of folution, precipitation, cryftallization, fermentation, nay animal and vegetable fecretion and affimilation, luccefsfully inveftigated, as cafes of local motion, and explained by the agency of central forces. Some thing of this kind, and that not inconfiderable, was done when Dr Cullen firft fhowed how the double affini ties might be illuftrated by the affiftance of numbers. Dr Black gave to this hint (for it was little more) that elegant precifion which characterizes all his views. Mr Kirwan has greatly promoted this ftudy by his numerous and ingenious examples of its application; and the moft valuable paffages of the writings of Mr Lavoifier, are thofe where he traces with logical precifion the balancings of force which appear in the chemical phenomena. It is from the fimilar balancings and confequent meafurements, which may be obferved and obtained in the prefent cafe, that we are to hope for admiffion into this almoft unbounded fcience of contemplation. We have another link equally interelting and promifing, viz. the production of heat by friction. This alfo highly deferyes the confideration of the mathematical philofopher.

\section*{S T E}
production of fleam hinders not in the fmalleft degree the trickling of more water into F , and the continual production of more fteam. This now preffes on the furface of the water in \(C D\), and caufes it to rife gradually in the funnel BA; but flowly, becaufe its cold furface is condenfing an imnenfe quantity of fteam. We may eafily fuppofe that the water trickles fafter into \(F\) than it is expended in the production of fleam; fo that it reaches farther into the ignited part, and may even fall in a ftream into fome deeper pit highly ignited. It will now produce fteam in vaft abundance, and of prodigious elafticity; and at once pufh up the water thro' the funnel in a folid jet, and to a great height. This mult continue till the furface of thie water finks to BD . If the lower end of the funnel have any inequalities or notches, as is moft likely, the fteam will get admiffion along with the water, which in this particular place is beiling hot, being fuperficial, and will get to the mouth of the funnel, while water is till preffed in below. At laft the fteam gets in at B on all fides; and as it is converging to \(B\), along the furface of the water, with prodigious velocity it fweeps along with it much water, and blows it up through the funnel with great force. When this is over, the remaining fleam blows out unmixed with water, growing weaker as it is expended, till the bottom of the funnel is again ftopped by the water increafing in the cavern CBD. All the phenomena above ground are perfectly conformable to the neceflary confequences of this very probable conftruction of the cavern. The feeling of being lifted up, immediately before the jct, in all probability is owing to a real heaving up of the whole roof of the cavern by the firf expanfion of the great body of fteam. We had an accurate defcription of the phenomena from perfons well qualified to judge of there matters who vifited thefe celebrated fprings in 1789.

StFAM-Engine, is the name of a machine which derives its moving power from the elafticity and condenfibility of the feam of boiling water. lt is the moft valuable prefent which the arts of life have ever received from the philofopher. The mariner's compafs, the telefcope, gunpowder, and other moft ufeful fervants to human weaknefs and ingenuity, were the productions of chance, and we do not exacly know to whom we are indebted for them ; but the fleam-engine was, in the very beginning, the refult of reflection, and the production of a very ingenious mind; and every improvement it has received, and every alteration in its conftruetion and principles, were alfo the refults of plilofophical ftudy.
The fteam-engine was beyond all doubt invented by the marquis of Worcefter during the reign of Cha. II. flis nobleman publihed in \(166_{3}\) a fmall book intitled A Century of Inventions; giving fome obfcure and enigmatical account of an hundred difcoveries or contrivances of his own, which he extols as of great importance to the public. He appears to have been a perfon of much knowledge and great ingenuity : but his defeription or accounts of thefe inventions feern not fo much intended to inftruet the public, as to raife wonder ; and his encomiums on their utility and importance are to a great degree extravagant, refembling more the puff of an advertifing tradefman than the patriotic communications of a gentleman. The marquis of Wor-

\section*{743 ] S T E}
cefter was indeed a projector, and very importunate and myfterious withal in his applications for public encou-

Steam: Engire. ragement. His account, however, of the fieam-engine, although by no means fit to give us any diftinet notions of its ftructure and operation, is exact as far as it goes, agreeing precifely with what we now know of the fubject. It is \(\mathrm{N}^{\prime} 68\). of his inventions. His words are as follow : "This admirable method which I propofe of raifing water by the force of fire has no bounds if the veffels be ftrong enough: for I have taken a cannon, and laving filled it \(\frac{3}{4}\) ths full of water, and thut up its muzzle and touch hole, and expofed it to the fire for 24 hours, it burf with a great explofion. Having afterwards difcovered a method of fortifying veffels internally, and combined them in fuch a way that they filled and acted alternately, I have made the water fpout in an uninterrupted ftream 40 feet high; and one veffel of rarefied water raifed 40 of cold water. The perfor who conducted the operation had nothing to do but turn two cocks; fo that one veffel of water being confumed, another begins to force, and then to \(6 l l\) iffelf with cold water, and fo on in fucceffion."
It does not appear that the noble inventor could ever But firft res intereft the public by thefe accounts. His character as duced to a projector, and the many failures which perfons of this captien by turn of mind daily experience, probably prejuciced peovary. ple againft him, and prevented all attention to his projects. It was not till towards the end of the century, when experimental philofophy was profecuted all over Europe with uncommon ardour, that thefe notions again engaged attention. Captain Savary, a perfon alfo of great invenuity and ardent mind, faw the reality and practicability of the marquis of Worcefter's project: He knew the great expanfive power of fteam, and had difcovered the inconceivable rapidity with which it is. reconverted into water by cold ; and he foon contrived a machine for raifing water, in which both of thefe properties were employed. He fays, that it was en tirely his own invention. Dr Defaguliers infifts that he only copied the marquis's invertion, and charges hin with grofs plagiarifm, and with having bought up. and burned the copies of the marquis's book, in order to fecure the honour of the difcovery to himfelf. This is a very grievous charge, and fhould have been fubftantiated by very diftinct evidenice. Defaguliers produces none fuch; and he was much too late to know what happened at that time. The argument which he gives is a very foolifh one, and gave him no title toconfider Savary's experiment as a fallehood; for it might have happened precifely as Savary relates, and not as it happened to Defaguiliers. The faet is, that Sav vary obtained his patent of invention after a hearing of objections, among which the dilcovery of the marquis of Worcefter was not mentioned : and it is certain that the account given in the Century of Inventions could inftruct no perfon who was not fufficiently acquainted with the properties of fteam to be able to invent the machine himfelf.
Captain Savary obtained hispatent after baving actually Papin hisa ereeted feveral machines, of which he gave a defcription 1 to claim to in a book intitled THE M M NER's FRIEND, publifhed in the inven1696, and in another work publiffed in 1699. Much Frenci pice about this time Dr Papin, a Erenchman and fellow of tend. the Royal Society, invented a method of diffolving bones and other animal folids in water, by confining

\section*{S T E}

SteamSingine.
them in clofe reffels, which he called digestefs, fo as to acquire a great degree of heat. For it muft be obferved in this place, that it had been difcovered long before (in 1684) by Dr Hooke, the mo't inquilitive experimental philofopher of that inquifitive age, that water could not be made to acquire above a certain temperature in the open air; and that as foon as it begins to boil, its tempcrature remains fixed, and an increafe of heat only produces a more violent ebullition, and a more rapid wafte. But Papin's experiments made the claftic power of fteam very familiar to him: and when he left England and fettled as profeffor of mathematics at Marpurgh, he made many aukward attempts to employ this force in mechanics, and even for raifing water. It appears that he had made experiments with this view in 1698 , by order of Charles Landgrave of Heffe. For this reafon the French affect to confider him as the inventor of the fteam-engine. He indeed publifhed fome account of his invention in 1707 ; but he acknowledges that Captain Savary had alfo, and without any communication with him, invented the fame thing. Whoever will take the trouble of looking at the defcription which he has given of thefe inventions, which are to be feen in the Alta Eruditorum, Lipfia, and in Leupold's Theatrum Machinarum, will fee that they are moft aukward, abfurd, and impracticable. His conceptions of natural operations were always vague and imperfect, and he was neitier philofopher nor mechanician.

We are thus anxious about the claim of thofe entlemen, becaufe a moft refpectable French author, Mr Boffut, fays in his Hydrodjnamique, that the firf notion of the fteam-engine was certainly owing to Dr Papin, who had not only invented the digetter, but had in 1695 publifhed a little performance defcribing a machine for raifing water, in which the pittons are moved by the vapour of boiling water alternately dilated and condenfed. Now the fact is, that Papin's firt publication was in 1707 , and his pifton is nothing more than a floater on the furface of the water, to prevent the wafte of Ateam by condenfation; and the return of the pifton is not produced, as in the fteam-engine, by the condenfation of the feam, but by admitting the air and a column of water to prefs it back into its place. The whole contrivance is fo aukward, and fo unlike any diftinct notions of the fubject, that it canuot do credit to any perfon. We may add, that mnch about the fame time Mr Amontons zontrived a very insenious but intricate machine, which he called a fire-zibeel. It confifted of a number of buckets placed in the circumference of a wheel, and communicating with each other by very intricate circuitous paffages. One part of this circumference was expofed to the heat of a furnace, and another to a ftrcam or ciftern of cold water. The - communications were fo difpofed, that the fteam produced in the buckets on one lide of the wheel drove the water into buckets on the other fide, \(f_{\theta}\) that one fide of the wheel was always much heavier than the other ; and it muft therefore turn round, and may execute fome work. The death of the inventor, and the intricacy of the machine, caufed it to be neglected. Another member of the Parilian acadeny of fiences (Mr Deflandes) alfo prefented to the academy a projeet of a fteam-wheel, where the impullive force of the vapour was employed; but it met with no encouragement.

The Englifh engineers had by this time fo mime im. proved savary's firlt invention, that it fupplat others. We have therefore no hefitation in gi honour of the firft and complete invention to tair quis of Worcelter; and we are net difpofe Captain Savary's claim to originality as to tion of the machine, and even thisk it pruval his own experiments made him fee the whole independent of the marquis's account.

Captain Savary's enginc, as improved and fimplified by himfelf, is as follows.

A (fig. 6.) reprefents a ftrong copper boiler proper-Captain ly built up in a furnace. There proceeds from its top vary's a large fteam-pipe B, which enters into the top of an-fleam-er other ftrong veffel \(R\) called the RECEIvER. This pipe \({ }_{\text {fcribed }}^{\text {gine de }}\) has a cock at Called the steam-cock. In the bottom of the receiver is a pipe F , which communicates fidewife with the rifing pipe KGH. The lower end \(H\) of this pipe is immerfed in the water of the pit or well, and its upper part \(K\) opens into the ciftern into which the water is to be delivered. Immediately below the pipe of communication \(F\) there is a valve \(G\), opening when preffed from below, and thutting when preffed downwards. A fimilar valve is placed at \(I_{9}\) immediately above the pipe of communication. Lafly, there is a pipc ED which branches off from the rifing pipe, and enters into the top of the receiver. This pipe has a cock D called the 1 njection cock. The mouth of the pipe ED has a nozzle. \(f\) pierced with fmall holes, pointing from a centre in every direction. The keys of the two cocks C and D are united, and the handle \(g b\) is called the regulator.

Let the regnlator be fo placed that the fteam-cock \(C\) is open and the injection-cock \(D\) is fhet ; put water in. to the boiler \(A\), and make it boil ftrongly. The fteam coming from it will enter the receiver, and gradually warm it, much fteam being condenfed in producing this effect. When it has been warmed fo as to condenfe no more, the fteam proceeds into the riling pipe; the valve \(G\) remains thut by its weight; the team lifts the valve \(I\), and gets into the rifing pipe, and gradually warms it. When the workman feels this to be the cafc, or hears the rattling of the valve \(I\), he inmmediately turns the fteam-cock fo as to fhut it, the injection-cock fill remaining fhut (at leaft we may fuppofe this for the prefent). The apparatus mult now cool, and the ftean in the receiver collapfes into water. 'There is nothing now to balance the preffure of the atmofphere; the valve I remains fhut by its weight; but the air incumbent on the water in the pit preffes up this water through the fuction-pipe HG , and caufes it to lift the valve \(G\), and flow into the receiver \(R\), and fill it to the top, if not more than 20 or 25 feet above the furface of the pit water.
'I'he tleam-cock is now opened. The feam which, during the cooling of the receiver, has been accumulating in the boiler, and acquiing a great elafticity by the action of the fire, now rufhes in with great violence, and, preffing on the furface of the water in the receiver, caufes it to fhut the valve \(G\) and open the valve I by its weight alone, and it now flows into the rifing pipe, and would Itand on a level if the elaflicity of the fteam were no more than what would balunce the atmofpherical preffure. But it is much more than this, and therefore is preffes the water out of the receiver into the rifing

\section*{S T E}
pipe, and will even caufe it to come out at IK, if the elaficicity of the fteam is fufficiently great. In order to enfure this, the boiler has another pipe in its top, covered with a fafty-valve V , which is kept down by a weight W furpended on a fteelyard L M. This weight is fo adjufted that its preffure on the fafety-valve is fomewhat. greater than the preffure of a column of water \(\mathrm{V} k\) as high as the point of difcharge K . The fire is fo regulated that the fteam is always iffuing a little by the loaded valve V . The workman keeps the fteamvalve open till he hears the valve I rattle. This tells him that the water is all forced out of the receiver, and that the Ream is now following it. He immediately turns the regulator which fhuts the fteam-cock, and now, for the firft time, opens the injection-cock. The cold water trickles at firf through the holes of the nozzle \(f\), and falling down through the feam, begins to condenfe it ; and then its elafticity being lefs than the prefflure of the water in the pipe K ED \(f\), the cold water fpouts in all directions through the nozzle, and, quick as thought, produces a complete condenfation. The valve \(G\) now opens again by the preffure of the atmolphere on the water of the pit, and the receiver is foon filled with cold water. The injection-cock is now fhut, and the fteam-cock opened, and the whole operation is now repeated; and fo on continually.
This, the fimple account of the procefs, and will ferve to give the reader an introductory notion of the operation; but a more minute attention muft be paid to many particulars before we can fee the properties and defects of this ingenious machine.
The water is driyen along the rifing pipe by the elafticity of the fteam. This muft in the boiler, and every part of the machine, exert a preffure on every fquare inch of the veffels equal to that of the upright column of water. Suppofe the water to be raifed 100 feet, about 25 of this may be done in the fuction-pipe; that is, the upper part of the receiver may be about 25 feet above the furface of the pit-water. The remaining 75 muft be done by forcing, and every fquare inch of the boiler will be fqueezed out by a preffure of more than 30 pounds. T'his very moderate height therefore requires wery ftrong veffels; and the Marquis of Worcefter was well aware of the danger of their burting. A copper boiler of fix feet diameter mult be ro this of an inch thick to be juft in equilibrio with this preffure : and the foldered joint will not be able to withffand it, efpecially in the high temperature to which the water muft be heated in order to produce fleam of fufficient elafticity. By confulting the table of the elafticity of feam deduced from our experiments mentioned in the preceding article, we fee that this temperature muf be at leaft \(280^{\circ}\) of Fahrenheit's thermometer. In this heat foft folder is juft ready to melt, and has no tenacity ; even fpelter folder is confiderably weakened by 'it. Accordingly, in a machine erected by Captain Savary at York Buildings in London, the workman having loaded the fafety-valve a little more than ufual to make the engine work more brikly, the boiler burft with a dreadful explofion, and blew up the furnace and adjoining parts of the building as if it कad been gunpowder. Mr Savary fucceeded pretty well in raifing moderate quantities of water to fmall heights, but could make nothing of deep mines. Many attempts were made, on the Marquis's principle, to
Vol. XVII. Part II.
ftrengthen the veffels from within by radiated bars and by hoops, but in vain. Very fmall boilers or evaporators were then tried, kept red-hot, or nearly fo, and fupplied with a flender ftream of water trickling into them; but this afforded no opportunity of making a collection of fteam during the rcfrigeration of the receiver, fo as to have a magazine of fteam in readinefs for the next forcing operation; and the working of fuch machines was always an employment of great danger and anxiety.

The only fituation in which this machine could be employed with perfect fafety, and with fome effect, was where the whole lift did not exceed 30 or 35 feet. In ed wintoy this cafe the greateft part of it was performed by the only in cer-fiction-pipe, and a very manageable preffure was fuffi-tain fituacient for the reft. Several machines of this kind were \({ }^{\text {tions }}\) erected in England about the beginning of this century. A very large one was erected at a falt-work in the fouth of France. Here the water was to be raifed no more than 18 feet. The receiver was capacious, and it was occafionally fupplied with fteam from a fmall falt-pan conltructed on purpofe with a cover. The entry of the fteam into the receiver merely allowed the water to run out of it by a large valve, which was opened by the hand, and the condenfation was produced by the help of a fmall forcing pump alfo worked by the hand. In fo particular a fituation as this (and many fuch may occur in the endlefs variety of human wants), this is a very powerful engine; and having few moving and rubbing parts, it muft be of great durability. This circumflance has occafioned much attention to be given to this firft form of the engine, even long after it was fupplanted by thofe of a much better conftruction. A very ingenious attempt was made very lately to adapt this conftruction to the ufes of the miners. The whole depth of the pit was divided into lifts of 15 feet, in the fame manmer as is frequently done in pump-machines. In each of thefe was a fuction-pipe 14 feet long, having above it a fmall receiver like \(R\), about a foot high, and its capacity fomewhat greater than that of the pipe. This receiver had a valve at the head of the fuctionpipe, and another opening outwards into the little ciftern, into which the next fuction-pipe above dipped to take in water. Each of thefe receivers fent up a pipe from its top, which all met in the cover of a large velfel above ground, which was of double the capacity of all the receivers and pipes. This veffel was clofe on all fides. A nother veffel of equal capacity was placed immediately above it, with a pipe from its bottom paffing through the cover of the lower veffel and reachin,r near to its bottom. This upper veffel communicates with the boiler, and conttitutes the receiver of the feam-engine. The operation is as follows: The lower veffel is full of water. Steam is admitted into the upper veffel, which expels the air by a valve, and fills the veffel. It is then condenfed by cold water. The preffure of the atmofphere would caufe it to enter by all the fuc-tion-pipes of the different lifts, and prefs on the furface of the water in the lower receiver, and force it into the upper one. But becaufe each fuction-pipe dips in a ciftern of water, the air preffes this water before it, raifes it into each of the little receivers which it fills, and allows the fpring of the air (which was formerly in them, but which now paffes up into the lower receiver) to force the water out of the lower receiver into the
upper

Steartm Engine.

8
Dccafinns great wafte of feam and fuel.
upper one. When this has been completed, the fteam is again admitted into the upper receiver. This allows the water to run back inte the lower receiver, and the air returns into the fmall receivers in the pit, and allows the water to run out of each into its proper ciftern. By this means the water of each pipe has been raifed 15 feet. The operation may thus be repeated continually.

The contrivance is ingenious, and fimilar to fome which are to be met with in the hydraulics of Schottus, Sturmius, and other German writers. But the operation muft be exceedingly flow; and we imagine that the expence of iteam muft be great, becaufe it muft fill a very larse and very cold veffel, which mutt wafte a great portion of it by condenfation. We fee by fome late publications of the very ingenious Mr Blackey, that he is ftill attempting to maintain the reputation of this machine by fome contrivance of this kind ; but we imagine that they will be ineffectual, except in fome very particular fituations.

For the great defect of the machine;' even when we can fecure it againf all rifk of burfting, is the prodigious wafte of tteam, and confequently of fuel. Daily experience fhows, that a few fcattered drops ot cold water is fufficient for producing an almioft inftantaneous condenfation of a great quantity of ftean. Therefore when the fteam is admitted into the receiver of Savary's engine, and comes into contact with the cold top and cold water, it is condenfed with great rapidity; and the water does not begin tn fubfide till its furface has become fo hot that it condenfes no more fteam. It may now begin to yield to the preffure of the incumbent fteam; but as foon as it defcends a little, more of the cold furface of the receiver comes into contact with the fteam, and condenfes more of it, and the water can defcend no farther till this addition of cold furface is heated up to the ftate of evaporation. This rapid condenfation goes on all the while the water is deicending By fome experiments frequently repeated by the writer of this article, it appears that no lefs than \(\frac{1}{2} \frac{1}{2}\) ths of the whole fteam is ufelefsly condenfed in this manner, and not more than \(\frac{3}{12}\) th is employed in allowing the water to defcend by its own weight ; and he has reafon to think that the portion thus wafted will be confiderably greater, if the fteam be employed to force the water out of the receiver to any confiderable height.

Obferve, too, that all this wafte muft be repeated in every fucceeding ftroke; for the whole receiver muft be cooled again in order to fill itfelf with water.

Many attempts have been made to diminifh this wafte; but all to little purpofe, becaufe the very fill. ing of the receiver with cold water occafions its fides to condenfe a prodigious quantity of fteam in the fucceeding ftroke. Mr Blackey has attempted to leffen this by ufing two receivers. In the firt was oil ; and into this only the fteam was admitted. This oil paffed to and fro between the two receivers, and never touched the water except in a fmall furface. But this hardly produced a fenfible diminution of the wafte: for it mult now be oblerved, that there is a neceffity for the firit cylinder's being cooled to a confiderable degree below the boiling point ; otherwife, though it will condenfe much fteam, and allow the water to rife into the receiver, there will be a great diminution of the height of fuction, unlefs the veffel be much cooled. 'This appears plainly
by infpecting the table of elafticity. Thus, if the veffel be cooled no lower than \(180^{\circ}\), we fhould lofe one half of the preffure of the atmofphere; if cooied to 120 , we fhould ftill lofe \(\mathrm{T}^{\mathrm{T}}\) th. The infpection of this table is of great ufe for underfanding and improving this noble machine; and without a conftant recollection of the elafticity of fteam correfponding to its actual heat, we fhall never have a notion of the niceties of its operation.

The rapidity with which the fteam is condenfed is The aft really aftonifhing. Experiments have bsen made on tifhing fteam-veffels of fix feet in diameter and feven feet high; which and it has been found, that about four ounces of water, \(4 . . \mathrm{m}\) is as warm as the human blood, will produce a completecondenf condenfation in lefs than a fecond; that is, will produce all the condenfation that it is capable of producing, leaving an elafticity about \(\frac{1}{5}\) th of the elafticity of the air. In another experiment with the fame fleam-veffel, no cold water was allowed to get into it, but it was made to communicate by a lons pipe four inches in diameter with another veffel immerfed in cold water. The condenfation was fo rapid that the time could not be meafured : it certainly did not exceed half a fecond. Now this condenfation was performed by a very trifing furface of contact. Perhaps we may explain it a little in this way: When a mafs of fteam, in immediate contact with the cold water, is condenfed, it leaves a void, into which the adjoining fleam inftantly expands; and by this very expanfion its capacity for heat is incleafed, or it grows cold, that is, abttracts the heat from the fleam fituated immediately beyond it. And in this expanfion and refrigeration it is itfelf partly condenfed or converted into water, and leaves a void, into which the circumjacent fteam immediately expands, and produces the fame effect on the fteam beyond it. And thus it may happers that the abitraction of a fmall quantity of heat from. an inconfiderable mafs of fteam may produce a condenfation which may be very extenfive. Did we know the change made in the capacity of feam for lieat by a given change of bulk, we fhould be able to tell exactly what would be the effect of this local actual condentation. But experiment has not as yet given us any precife notions on this fubject. We think that this rapid condenfation to a great diflance by a very moderate actual abftraction of heat is a proof that the capacity of fteam tor heat is prodigiounly increafed by expanfion. We fay a very moderate actual abflucli=n of heat, becaufe very little heat is neceffary to raife four ounces of bloodwarm water to a boiling temperature, which will unfit it for condenfing fteam. The remarkable phenomenon of fnow and ice produced in the Hungarian machine, when the air condenfed in the receiver is allowed to blow through the cock (fee Pneumatics), fhows this to be the cafe in moift air, that is, in air holding water in a ftate of chemical folution. We fee fomething very like it in a thunder-form. A fmall black cloud fometimes appears in a particular fpot, and in a very few feconds fpreads over many hundred acres of \(\mathrm{Nky}^{2}\), that is, a precipitation of water goes on with that rapid diffufion. We imagine that this increafe of capacity or demand for heat, and the condenfation that mult enfue if this demand is not fupplied, is much more remarkable in pure watery vapours, and that this is a capital dif. tinction of their conflitution from vapours diffolved in air.
reader muft now be fo well acquainted with what paffes in the fteam-veffel, and with the exterior refults from it, as readily to comprehend the propriety of the changes which we fhall now defcribe as having been made in the confruction and principle of the fteamengine.

Of all places in England the tin-mines of Cornwall ftood moft in need of hydraulic affiltance; and Mr Savary was much engaged in projects for draining them by his fteam-engine. This made its conftruction and principles well known among the machinifts and engineers of that neighbourhood. Among there were a Mr Newcomen, an iron-monger or black fmith, and Mr Cawley a glazier at Dartmouth in Devonfhire, who had dabbled much with this machine. Newcomen was a perfon of fome readine, and was in particular acquainted with the perfon, writinge, and projects of his countryman Dr Hooke. There are to be found among Hooke's papers, in the poffeffion of the Royal Society, fome notes of obfervations, for the ufe of Newcomen his countryman, on Papin's boafted method of tranfmitting to a great diftance the action of a mill by means of pipes. Papin's project was to employ the mill to work two airpumps of great diameter. The cylinders of thefe pumps were to communicate by means of pipes with equal cylinders furnihed with piftons, in the neighbourhood of a diftant mine. Thefe piltons were to be connected, by means of levers, with the pilton-rods of the mine. Therefore, when the pifton of the air-pump at the mill was drawn up by the mill, the correfponding pitton at the fide of the mine would be prefled down by the atmofphere, and thus would raife the pifton-rod in the mine, and draw the water. It would appear from thefe rotes, that Dr Fooke had diffuaded Mr Newcomen from erecting a machine on this principle, of which he had expofed the fallacy in feveral difcourfes before the Royal Society. One paffage is remarkable. "Could he (meaning Papin) make a fpeedy vacuum under your fecond piton, your work is done."

It is highly probable that, in the courfe of this fpeculation, it occurred to Mr Newcomen that the vacuum he fo much wanted might be produced by fleam, and that this gave rife to his new primciple and conftruction of the Ateam-engine. The fpecific defideratum was in Newcomen's mind; and therefore, when Savary's engine appeared, and became known in his neighbourhood many years after, he would readily catcl at the help which it promifed.
Savary however claims the invention as his own; but Switzer, who was perfonally acquainted with both, is pofitive that Newcomen was the inventor. By his principles (as a quaker) leing averfe from contention, he was contented to fhare the honour and the profits with Savary, whofe acquaintance at court enabled him to procure the patent in 1705 , in which all the three were affociated. Pofterity has done juftice to the modeft inventor, and the machine is univerfally called Newcomen's Engine. Its principle and mode of operation may be clearly conceived as follows.
Let A (fig. 7.) reprefent a great boiler properly built in a furnace. At a fmall height above it is a cylinder CBBC of metal, bored very truly and finoothly. The boiler communicates with this cylinder by means of the throat or feam pipe NQ. The lower aperture of this pipe is fhut by the plate N , which is
ground very flat, fo as to apply very accurately to the whole circumference of the orifice. This plate is

Steam. Engine. called the regulator or feam-cock, and it turns horizontally round an axis \(b a\) which paffes throush the top of the boiler, and is nicely fitted to the focket, like the key of a cock, by grinding. The upper end of this axic is furnifhed with a handle \(b \mathrm{~T}\).

A pifton \(P\) is fufpended in this cylinder, and made air-tight by a packing of leather or foft rope, well filled with tallow ; and, for greater fecurity, a fmall quantity of water is kept above the pifton. The piton-rod PD is furpended by a chain which is fixed to the upper extremity \(F\) of the arched head FD of the great lever or Working Beam HK, which turns on the gudgeora. O. There is a fimilar arched head EG at the other end of the beam. To its upper extremity E is fixed a chain carrying the pump-rod XL, which raifes the water from the mine. The load on this end of the beam is made to exceed confiderably the weight of the pifton P at the other extremity.

At fome fmall height above the top of the cylinder is a ciftern W called the Injection Cistern. From this defcends the Injection Pipe ZSR, which enters the cylinder through its bottom, and terminates in a fmall hole \(R\), or fometimes in a nozzle pierced with many fmaller holes diverging from a centre in all directions. This pipe has at S a cock called the \(\mathrm{I}_{\mathrm{N}}\) jection Соск, fitted with a liandle V.
At the oppofite fide of the cylinder, a little above its bottom, there is a lateral pipe, turning upwards at the extremity, and there covered by a clack-valve \(f\), called the Smifting Valve, which has a little difh round it to hold water for keeping it air-tight.

There proceeds alfo from the bottom of the cylinder a pipe deg \(g\) (paffing bchind the boiler), of which the lower end is turned upwards, and is covered with a valve b. This part is immerfed in a ciltern of water Y, called the Hor Well, and the pipe itfelf is called the Eduction Pipe. Laftly, the boiler is furnifhed with a fatety-valve called the Puppet Clack (which is not repretented in this \(\mathbb{A}\) ketch for want of room), in the fame manner as Savary's engine. This valve is generally loaded with one or two pounds on the fquare inch, fo that it allows the fteam to efcape when its clafticity is \(\bar{\gamma} \overline{0}\) th greater than that of common air. Thus all rifk of burling the boiler is avoided, and the preffure outwards is very moderate ; fo alfo is the heat. For, by infpecting the table of vaporous elafticity, we fee that the heat correfponding to 32 inches of elafticity is only about \(216^{\circ}\) of Falrenheit's thermometer.

Thefe are all the effential parts of the engine, and are here drawn in the moft finple form, till our knowledge of their particular offices fhall fhow the propriety of the peculiar forms which are given to them. Let us now fee how the machine is put in motion, and what is the nature of its work.

The water in the boiler being fuppofed to be in a How the flate of ftrong ebullition, and the feam iffuing by the machine fafety-valve, let us confider the machine in a fate of motion, reft, having both the fteam-cock and injection cock. Thut. and the naThe refting pofition or attitude of the machine muft be ture of the fuch as appears in this fketch, the pump rods preponde-work. rating, and the great pifton being drawn up to the top of the cylinder. Now open the fleam cock by turning the handle T of the regulator. The fleam from the

\section*{S T E［ 748 ］S T E}

Steam： Engine．

\section*{S T E}
fed fleam, to defcend by its own weight through the eduetion-pipe \(d e g b\) to open the valve \(h\), and to run out into the hat well. And we muft eafily fee that this water is boiling hot; for while lying in the bottom of the cylinder, it will condenfe fteam till it acquires this temperature, and therefore cannot run down till it condenfes no more. 'I'here is fill a wafte of fteam at its firft admiffion, in order to heat the infide of the cylinder and the injected water to the boiling temperature: but the fpace being fmall, and the whole being already very warm, this is very foon done; and when thinga are properly conftructed, little more fteam is wanted than what will warm the cylinder; for the eductionpipe receives the injection water even during the defcent of the pifton, and it is therefore removed pretty much out of the way of the fteam.

This firt puff of the entering fteam is of great fervice: it drives out of the cylinder the vapour which it finds there. This is feldom pure watery vapour: all water contains a quantity of air in a ftate of chemical union. The union is but feeble, and a boiling heat is fufficient for difengaging the greateft part of it by increafing its elafticity. It may alfo be difengaged by fimply removing the external preffure of the atmofphere. This is clearly feen when we expofe a glafs of water in an exhaufted receiver. Therefore the fmall fpace below the pifton contains watery vapour mixed with all the air which had been difengaged from the water in the boiler by ebullition, and all that was feparated from the injection water by the diminution of external preflures. All this is blown out of the cylinder by the firft puff of fteam. We may oblerve in this place, that waters differ exceedingly in the quantity of air which they hold in à ftate of folution. All fpring water contains much of it: and water newly brought up from deep mines contains a great deal more, becaufe the folution was aided in thefe fituations by great pref.
fures. Such waters fparkle when poured into a glafs. It is therefore of great confequence to the good performance of a fteam-engine to ufe water containing little air, both in the boiler and in the injection-ciftern. The water of running brooks is preferable to all others, and the freer it is from any faline impregnation it generally contains lefs air. Such engines as are, fo unfortunately fituated that they are obliged to employ the very water which they have brought up from great depths, are found greatly inferior in their performance to others. 'Ihe air collected below the pifton great. ly diminifhes the accelerating force, and the expulfinn of fuch a quantity requires a long continued blaft of the beft fleam at the beginning of every ftroke. It is advifable to keep fuch water in a large fhallow pond for a long while before ufing it.

Let us now confider the tate of the pifton. It is evident that it will ftart or begin to rife the moment the fteam-cock is opened; for at that inftant the excels of atmofpherical preffure, by which it was kept down in oppolition to the preponderancy of the outer end of the beam, is diminifhed. 'The pifton is therefore dragged upwards, and it will rife even although the fteam which is admitted be not fo elaftic as common air. Suppole the mercury in the barometer to ftand at 30 inches, and that the preponderancy at the outer end of the beam is \(\frac{1}{6}\) th of the preffure of the air on the pifton, the pifton will not rife if the elafticity of the fleam is not equal to

49 S T E
30- \(\frac{30}{9}\), that is, to 26,7 inches nearly ; but if it is jult this quantity, the pifton will rife as faft as this fteam can be fupplied through the fteam-pipe, and the velocity of its afcent depends entirely on the velocity of this fupply. Ihis obfervation is of great importance ; and it does not feem to have occurred to the mathematicians, who lave paid moft attention to the mechanifm of the motion of this engine. In the mean time, we may clearly fee that the entry of the fteam depends chiefly on the counter weight at E : for fuppofe there was none, fteam no ftronger than air would not enter the cylinder at all; and if the fteam be ftronger, it will enter only by the excefs of its frength. Writers on the fteam-eneine (and even fome of great reputation) familiarly fpeak of the fteam giving the piston a pufh: But this is fcarcely poffible. During the rife of the pifton the finiting valve is never obferved to blow; and we have not heard any well attefted accomnts of the piltonchains ever being flackened by the upward preffure of the fteam, even at the very beginning of the ftroke. During the rifing of the pifton the fteam is (according to the common conception and manner of fpeaking) fucked in, in the fame way that air is fucked into a common fyringe or pump when we draw up the pifton; for in the fteam-engine the pifton is really drawn up by the counter weight. But it is fill more fucked in, and requires a more copious fupply, for another reafon. As the pifton defcended only in confequence of the infide of the cylinder's being fufficiently cooled to condenfe the fteam, this cooled furface muft again be prefented to the fteam during the rife of the pifton, and mult con denfe fteam a fecond time. The pitton cannot rife anm other inch till the part of the cylinder which the pifton has already quitted has been warmed up to the boiling point, and Iteam mult be expended in this warming. The inner furface of the cylinder is not only of the heat of boiling water while the pifton rifes, but is alfo perfectly dry; for the film of water left on it by the afcending pifton muft be completely evaporated, otherwife it will be condenfing fteam. That the quantity thus' wafted is confiderable, appears by the experiments: of Mr Beighton. He found that five pints of water were boiled off in a minute, and produced 16 ftrokes of an engine whofe cylinder contained II 3 gallons of 282 inches each ; and he thence concluded that fteam was 2886 times rarer them water. But in no experiment madewith fcrupuluus care on the expanfion of builing water does it appear that the denfity of fteam exceeds \(\frac{1}{10,000}\) th of the denfity of water. Defaguliers fays that it is above 14,000 times rarer than water. We have frequently attempted to meafure the weight of fteam which filled a very light veffel, which held 12,600 grains of water, and found it always lefs than one grain; fo that we have no doubt of its being much more than 10,000 times rarer than water. This being the cafe, we may fafely fuppofe that the number of gallons of fteam, inftead of being if times II3, were nearly five times as much; and that ouly \(\frac{1}{5}\) th were employed in allowing the pifton to rife, and the remaining \(\frac{4}{5}\) ths were employed to warm the cylinder.

The moving force during the afcent of the pifton Itsafcent mult be confidered as refulting chiefly, if not folely, chiefly owfrom the preponderating weight of the pit pifton-rods. weight of The office of this is to retiorn the fteam-pifton to the the pit pie

\section*{S T E}
[

SteamEngine.
top of the cylinder, where it may again be preffed down by the air, and make another working ftroke by raifing the pump rods. But the counter-weight at E has another fervice to perform in this ufe of the engine; namely, to return the pump piftons into their places at the bottom of their refpective working barrels, in order that they alfo may make a working froke. This requires force independent of the friction and inertia of the moving parts; for each pitton mult be pulhed down through the water in the barrel, which muft rife through the pifton with a velocity whofe propartion to the velocity of the pilton is the fame with that of the bulk of the pifton to the bulk of the perforation through which the water rifes through the pifton. It is enough at prefent to mention this in general terms : we fhall confider it more particularly afterwards, when we come to calculate the pertormance of the engine, and to deduce from our acquired knowledge maxims of conftruction and improvement.

From this general confideration of the afcent of the pifton, we may fee that the motion differs greatly from the defcent. It can hardly be fuppofed to accelerate, even if the feam in the cylinder were in a moment annilated. For the refiftance to the defcent of the pifton is the fame with the weight of the column of water, which would caufe it to flow through the box of the pump pifon with the velocity with which it really rifes through it, and muft therefore increafe as the fquare of that velocity increafes ; that is, as the fquarc of the velocity of the pifton increafes. Independent of friction, therefore, the velocity of defcent through the water mult foon become a maximum, and the motion become uniform. We fhall fee by and by, that in fuch a pump as is generally ufed this will happen in lefs than the 10th part of a fecond. The friction of the pump will diminifh this velocity a little, and retard the time of its attaining uniformity. But, on the other hand, the fup. ply of fteam which is neceffary for this notion, being fufceptible of no acceleration from its previous motion, and depending entirely on the brifknels of the ebullition, an almoft inftantaneou fop is put to acceleration.

Accordingly, any perfon who obferves with attention the working of a fteam-engine, will fee that the rife of the pitton and defeent of the pump-rods is extremely uniform, whereas the working ftroke is very fenfibly accelerated. Before quitting this part of the

21
The coun leject, and left it frould afterwards efcape our recal er wein- lection, we may obferve, that the counter weight is difis diffe ent during the two nocions of the pump-rods. ferent during the two motions of the pump-rods. While the machine is making a working ftroke, it is lifting not only the column of water in the pump, but the abfolute weight of the piftons and pilton-rods alfo: but while the pump-rods are defcending, there is a di- minution of the counter weight by the whole weight loft by the immerfion of the rod in water. 'I'he wooden rods which are generally ufed, foaked in water, and joined by iron ftraps, are heavier, and but a little heavier than water, and they are generally about one third of the bulk of the water in the pumps.

Thefe two motions complete the period of the operation; and the whole may be repeated by fhutting the fteam-cock and opening the injection-cock whenever the pifton has attained the proper height. We have been very minute in our attention to the different circum. Atances, that the reader may have a diftinct notion of
the Itate of the moving forces in every period of the operation. It is by no means fufficient that we know in general that the injection of cold water makes a void which allows the air to prefs down the piton, and that the readmiffion of the fteam allows the pifton to rife again. This lumping and novenly way of viewing it has long prevented even the philofopher from feeing the defects of the conftruction, and the methods of removing them.

We now fee the great difference between Savary's Differeno and Newcomen's engine in refpect of principle. Sava- between ry's was really an engine which raifed water by the sivary's New force of fteam ; but Neweomen's raifes water entirely comen's by the preffure of the atmofphere, and fteam is em-machiuce ployed inerely as the moft expeditious method of producing a void, into which the atmolpherical preflure may impel the firft mover of his machine. The elatticity of the Iteam is not the firt mover.

We fee alfo the great fuperiority of this new ma-Suporior chine. We have no need of feam of great and dange- of Newrous elatticity; and we operate by means of very moderate heats, and confequently with much fmaller quan tities of fuel; and there is no bounds to the power of this machine. How deep foever a mine may be, a cylinder may be employed of fuch dimenfions that the preffure of the air on its pifon may exceed in any degree the weight of the column of water to be raifed. And laftly, this form of the machine renders it applicable to almoft every mechanical purpofe; becaute a Akilful mechanic can readily find a method of converting the eciprocating motion of the working beam into a motion of any kind which may fuit his purpofe. Savary's engine could hardly admit of fuch an immediate application, and feems almolt reftricted to raifing water.

Inventions improve by degrees. This engine was Gradually firft offered to the public in 1705 . But many difficul-improved ties occurred in the execution, which were removed one by one; and it was not till 1712 that the engine feemed to give confidence in its efficacy. The moft exact and unremitting attention of the manazer was required to the precife moment of opening and fhutting the cocks; and neglect might frequently be ruinous, by beating out the bottom of the cylinder, or allowing the pifton to be wholly drawn out of it. Stops were contrived to prevent both of thefe accidents ; then ftrings were ufed to connect the handles of the cocks with the beam, fo that they fhould be turned whenever it was in certain pofitions. Thefe were gradually changed and ind fime improved into detents and catches of different fhapes ; plified. at laft, in 17 I 7 , Mr Beighton, a very ingenious and well informed artitt, fimplinied the whole of thefe fubordinate movements, and brought the machine iuto the form in which it has continued, without the fmalleft material change, to the prefent day. We fhall now defcribe one of thefe improved engines, copying almoft exactly the drawings and defcription given by Boflut in his Hydrodynamique; thefe being by far the moft accurate and perfpicuous of any that have been publifhed.

Fig. 8. \(n^{\circ}\) i. is a perfpective view of the boiler cylinder, and all the parts neceffary for turning the cocks. Fig. 8. \(\mathrm{n}^{\circ}\) 2. is a vertical fection of the fame; and the fame pieces of both are marked with the fame letters of reference.

\section*{S T E \\ [75!] \\ S TE}

The \(\operatorname{rod} \mathbf{X}\) of the pifton \(\mathbf{P}\) is fufpended from the arch of the working-beam, as was reprefented in the preceding fketch (fig. 7). An upright bar of timher FG is alfo feen hanging by a chain. This is fufpended from a concentric arch of the beam, as may be feen alfo in the fketch at \(7 \delta\). T'his bar is called the flugbeam, and it mult rife and fall with the pifton, but with a flower motion. 'The ufe of this plag-beam is to give motion to the different pieces which turn the cocks.

The fteam-pipe K is of one piece with the bottom of the cylinder, and rifes within it an inch or two, to prevent any of the cold injection water from falling into the boiler. The lower extremity Z of the feampipe penetrates the head of the boiler, pr jecting a little way. A flat plate of brafs, in fhape refembling a racket or battledore, called the regulator, applies it felf exactly to the whole circumference of the feam=pipe, and completely excludes the fteam from the cylinder. Being moveable round an upright axis, which is reprefented by the dotted lines at the fide of the feam-pipe in the profile, it may be turned afide by the handle \(i\), \(n^{\circ} 1\). The profile fhows in the fection of this plate a protuberance in the middle. This refts on a ftoong fiat fpring, which is fixed below it athwart the mouth of the fteam-pipe. This fpring preffes it ftrongly towards the fteam-pipe, caufing it to apply very clofe; and this knob fides along the fpring, while the regulator turns to the right or left.

We have faid that the injection water is furnifhed from a ciftern placed above the cylinder. When this ciftern cannot be fupplied by pipes from fome more elevated fource, its water is raifed by the machine itfelf. A fmall lifting pump ik (fig. 7.), called the jackbead or jarquette, is worked by a rod \(\gamma\), fufpended from a concentric arch \(\varepsilon \gamma\) near the outer end of the working beam. This forces a fmall portion of the pit water along the rifing pipe \(i\) LMI into the injection cittern.

In hgure 8. n' 1 . and 2. the letters QM 3' reprefent the pipe which brings down the water from the injection ciltern. This pipe has a cock at \(R\) to open' or hut the paffage of this water. It fpouts through the jet \(3^{\prime}\), and dafhing againt the botton of the pifton, it is difperfed into drops, and fcattered through the whole capacity of the cylinder, fo as to produce a rapid condenfation of the iteam.

An upright poft A may be obferved in the perfpective view of the cylinder, \& c. This fupports one end B of a horizontal iron axis BC. The end \(C\) is fupported by a fimilar poit, of which the place only is marked by the dotted lines A, that the pieces connected with this axis may not be hid by it. A kind of flirrup \(a b c d\) hangs from this axis, fupported by the hooks \(a\) and \(d\). This ftirrup is croffed near the bottom by a round bolt or bar \(e\), which paffes through the eyes or rings that are at the ends of the horizontal fork \(b f g\), whofe long tail \(b\) is double, receiving between its branches the handle \(i\) of the regulator. It is plain from this contruction, that when the ftirrup is made to vibrate round the horizontal axis BC , on which it hangs freely by its hooks, the bolt \(e\) mult pull or puth the long fork \(b \mathrm{fg}\) backwarks and forwards horizontally, and by fo doing will move the regulator round its axis by means of the hardle \(i\). Both the tail of the fork and the bandle of the regulator are pierced with feveral
holes, and a pin is put through them which unites them by a joint. The motion of the handle may be increa- fed or diminifhed by choofing for the joint a hole near to the axis or remote from it ; and the exact pofition at which the requlator is to ftop on both lides is determined by pins ftuck in the horizontal bar on which the end of the handle appears to reft.

This alternate motion of the regulator to the right and left is proluced as follows: There is fixed to the axis BC a piece of iron okl, called the \(Y\), on account of its refemblance to that letter of the alphabet inverted. The talk o carries a lieavy lump \(p\) of lead or iron; and a long leather ftrap \(q p r\) is faftened to \(p\) by the middle, and the two ends are faftened to the beam above it , in fuch a manner that the lump may be alternately catched and held up to the right and left of the perpendicular. By adjufting the length of the two parts of the ftrap, the \(Y\) may be ftopped in any defired pofition. The two claws \(k\) and / fpread out from each other, and from the line of the falk, and they are of foch length as to reach the horizontal bolt \(e\), which croffes the ftirrup below, but not to reach the bottom of the fork \(b \int g\). Now fuppofe the firrup hanging perpendicularly, and the ftalk of the Y alfo held perpendicular ; carry it a little outward from the cylinder, and then let it go. It will tumble farther out by its: weight, without affecting the ftirrup till the claw \(l\) ftrikes on the horizontal bolt \(e\), and then it pufhes the ftirrup and the fork towards the cylinder, and opens. the resulator. It fets it in motion with a fmart jerk, which is an effectual way of overcoming the cohefion and friction of the regulator with the mouth of the Ateam-pipe. This pufh is adjuited to a proper length by the itrap \(q p\), which fops the Y when it has gone far enough. If we now take hold of the falk of the Y, and move it up to the perpendicular, the width between its claws is fuch as to permit this motion, and fomething more, without affecting the Itirrup. Hut when pufhed ftill nearer to the cylinder, it tumbles towards it by its own weight, and then the clav \(k\) frikes. the bolt \(e\), and drives the ftirrup and fork in the oppofite direction, till the lump \(p\) is catclied by the ftrap \(r p\), now ftretched to its full length, while \(q p\) han s flack. Thus by the motion of the \(Y\) the regulator is opened and fhat. Let us now fee how the motion of the \(Y\) is produced by the machine itfelf. To the horizontal axis \(13 C\) are attached two fpanners or handles \(m\) and \(n\). The fpanner \(m\) paffes through a long lit in the pluge beam, and is at liberty to move upwards or downwards by its motion round the axis BC. A pin \(\boldsymbol{z}\) which goes through the plug-beam catches hold of \(m\) when the beam rifes along with the pifton; and the pin is fo placed, that when the beam is within an inch or two of its bigheft rife, the pin has lifted \(m\) and thrown the ftalk of the Y paft the perpendicular. It therefore tumbles over with great force, and gives a fmart blow to the fork, and immediately fhuts the regulator. By. this motion the fpanner \(m\) is removed out of the neigh bourhood of the plug-beam. But the fpanner \(n\), moving along with it in the fame direction, now comes into the way of the pins of the plug-beam. Therefore, when the pifton defcends again by the condenfation of the fteam in the cylinder, a pin marked \(\mathcal{E}\) in the fide of the plug-beam catches hold of the tail of the fpanner \(n\), and by preffing it down raifes the lump on the

\section*{S T E}

StexmEngine.
ftalk of the \(Y\) till it paffes the perpendicular, and it then falls down, outwards from the cylinder, and the claw \(l\) again drives the fork in the direction \(b i\), and opens the fteam valve. This opening and fhutting of the fteam valve is executed in the precife moment that is proper, by placing the pins \(\pi\) and \(\sigma^{\circ}\) at a proper height in the plug-beam. For this reafon, it is pierced through with a great number of holes, that the places of thefe pins may be varied at pleafure. This, and a proper curvature of the fpanners \(m\) and \(n\), make the adjuftment as nice as we pleafe.
'Hhe injection-cock R is managed in a fimilar manner. On its kéy may be obferved a forked arm st, like a crab's claw ; at a little diftance above it is the gudgeon or axis \(u\) of a piece \(y u z^{\prime}\), called the hammer or the F, from its refemblance to that letter. It has a lump of metal \(y\) at one end, and a fpear \(u s\) projects from its middle, and paffes between the claws \(s\) and \(t\) of the arm of the injection-cock. The hammer \(y\) is held up by a notch in the underfide of a wooden lever DE, moveable round the centre D , and fupported at a proper height by a fring \(r \mathrm{E}\) made faft to the joift above it.

Suppofe the injection-cock fhut, and the hammer in the pofition reprefented in the figure. A pin of the plug-frame rifes along with the pifton, and catching hold of the detent DE, raifes it, and difengages the hammer \(y\) from its notch. This immediately falls cown, and ftrikes a board L put in the way to ftop it. The fpear us takes hold of the claw \(t\), and forces it atide towards \(x\), and opens the injection-cock. The pitton immediately defcends, and along with it the plug-frame. During its defcent the pin \(\beta\) meets with the tail \(u z^{\prime}\) of the hammer, which is now raifed confiderably above the level, and brings it down along with it, raifing the lump \(y\), and gradually fhutting the injec tion-cock, becaufe the fpear takes hold of the claws of its arm. When the beam has come to its loweft fitmation, the hammer is apain engaged in the notch of the detent DE, and fupported by it till the pifton again reaches the top of the cylinder.

In this manner the motions of the injection cock are alfo adjufted to the precife moment that is proper for them. The different pins are fo placed in the plugframe, that the fteam-cock may be completely fhut before the injection-cock is opened. The inherent motion of the machine will give a fmall addition to the afcent of the pifton without expending fteam all the while; and by leaving the fteam rather lefs elaftic than before, the fubfequent defcent of the pifton is promoted. There is a confiderable propriety in the gradual fhutting of the injection-cock. For after the firt dafh of the cold water againft the bottom of the pifton, the condenfation is nearly complete, and very little more water is needed; but a continual acceffion of fome is abfolutely neceffary for completing the condenfation, as the capacity of the cylinder diminifhes, and the water warms which is already injected.

In this manner the motion of the machine will be repeated as long as there is a fupply of fteam from the boiler, and of water from the injection ciftern, and a difcharge procured for what has been injected. We proceed to confider how thefe conditions alfo are provided by the machine itfelf.

The injection citern is fupplied with water by the
jackhead-pump, as we have already obferved. From this fource all the parts of the machine receive their refpective fupplies. In the firt place, a fmall branch 13,13 , is taken off from the injection-pipe immediately below the ciftern, and conducted to the top of the cylinder, where it is furnifhed with a cock. The fpout is fo adjufted, that no more runs from it than what will keep a conftant fupply of a foot of water above the pifton to keep it tight. Every time the pifton comes to the top of the cylinder, it brings this water along with. it, and the furplus of its evaporation and leakage runs off by a watte pipe 14, 14. This water neceffarily be* comes almoft boiling hot, and it was thought proper to employ its overplus for fupplying the wafte of the boils er. This was accordingly practifed for fome time. But Mr Beighton improved this economical thought, by fupplying the boiler from the eduction-pipe 2, 2, the water of which mult be ftill hotter than that above the pifton. This contrivance required attention to many circumftances, which the reader will underftand by confidering the perfpective and profile. The eduction pipe comes out of the bottom of the cylinder at a with a perpendicular part, which bends fidewife below, and is fhut at the extremity r. A deep cup 5 communicates with it, holding a metal valve nicely fitted to it by grinding, like the key of a cock. To fecure its being always air-tight, a flender ftrean of water trickles into it from a branch 6 of the wafte pipe from the top of the cylinder. The eduction-pipe branches off at 2 , and goes down to the hot well, where it turns up, and is covered with a valve. In the perfpective view may be obferved an upright pipe 4,4 , which goes through the head of the boiler, and reaches to within a few inches of its bottom. This pipe is called the feeder, and rifes about three or four feet above the boiler. It is open at both ends, and has a branch 3,3 , communicating with the bottom of the cup 5 , immediately above the metal valve, and alfo a few inches below the level of the entry 2 of the eduction-pipe. This communicating branch has a cock by which its paffacye may be diminifaed at pleafure. Now fuppofe the feam in the boiler to be very ftrong; it will caufe the boiling water to rife in the feeding pipe above 3 , and coming along this branch, to rife alfo in the cup 5 , and rum over. But the height of this cup above the furface of the water in the boiler is fuch, that the fteam is never ftrong enough to produce this effect. Therefore, on the contrary, any water that may be in the cup 5 will run off by the branch 3,3 , and go down into the boiler by the feeding pipe.
Thefe things being underfood, let us fuppofe a quantity of injected water lying at the bottom of the cylinder. It will run into the eduction pipe, fill the crooked branch 1,1 , and open the valve in the bottom of the cup (its weight being fupported by a wire hang. ing from a flender fpring), and it will fill the cup to the level of the entry 2 of the eduction-pipe, and will then flow along 3, 3, and fupply the boiler by the feeder 4, \(4 \cdot\) What more water runs in at I will now go along the eduction-pipe 2,2 , to the hot well. By properly adjufting the cock on the branch 3,3 , the boiler may be fupplied as faft as the wafte in feam requires. This is a moft ingenious contrivance, and does great honour to Mr Beighton. It is not, however, of much impertance. The fmall quantity which the boiler requires

\section*{S T E}
may be immediately taken even from a cold ciftern without fenfibly diminifing the production of fteam: for the quantity of heat neceffary for raifing the fenfible heat of cold water to the boiling temperature is quite infignificant, when comparcd with the quantity of heat which mutt then be combined with it in order to convert the water into fteam. No difference can be obferved in the performance of fuch engines and of thofe which have their boilers fupplied from a brook. It has, however, the advantage of being purged of air; and when an engine muft derive all its fupplies from pit watcr, the water from the eduction-pipe is vaftly preferable to that from the top of the cylinder.

We may here obferve, that many writers (among them the Abbé Boffut), in their defcriptions of the fteam-engine, have drawn the branch of communication 3,3 , from the feeding pipe to a part of the crooked pipe 1, 1, lying below the valve in the cup 5. But this is quite erroneous ; for, in this cafe, when the injection is made into the cylinder, and a vacuum produced, the water from the boiler would immediately rufh up through the pipes 4, 3, and fpout up into the cylinder: fo would the external air coming in at the top of the feeder.
This contrivance has alfo enabled us to form fome judgment of the internal ftate of the engine during the performance. Mr Beighton paid a minute attention to the fituation of the water in the feeders and eductionpipe of an engine, which feems to have been one of the beft which has yet been erceted. It was lifting a column of water whofe weight was \(\frac{4}{7}\) ths of the preffure of the air on its piften, and made 16 ftrokes, of 6 feet each, in a minute. This is acknowledged by all to be a very great performance of an engine of this form. He concluded that the elafticity of the fteam in the cylinder was never more than one-tenth greater or lefs than the elafticity of the air. The water in the feeder never rofe more than three feet and a half above the furface of the boiling water, even though it was now lighter by \(i_{i} \frac{\pi}{7}\) th than cold water. The eduction-pipe was only \(4 \frac{1}{2}\) feet long (vertically), and yet it always difcharged the injection water completely, and allowed fome to pafs into the feeder. This could not be if the fteam was much more than \({ }^{\frac{x}{0}}\) th weaker than air. By grafping this pipe in his hand during the rifc of the pitton, he could guefs very well whereabouts the furface of the hot water in it refted during the motion, and he never found it fupported fo high as four feet. Therefore the fteam in the cylinder had at leaft \(\frac{8}{9}\) ths of the elafticity of the air. Mr Buat, in his examination of an engine which is erected at Montrelaix, in France, by an Englifh engineer, and has always been confidered as the pattern in that country, finds it neceffary to fuppofe a much greater variation in the ftrength of the fteam, and fays that it muft have been \(\frac{1}{5}\) th ftronger and \(\frac{\pi}{5}\) th weaker than common air. But this engine has not been nearly fo perfect. Its lift was not more than \(\frac{1}{2}\) of the preffure of the atmofphere, and it made but nine ftrokes in a minute. At \(W\) is a valve covering the mouth of a fmall pipe, and furrounded with a cup containing water to keep it air-tight. This allows the air to efcape which had been extricated fiom the water of laft injection. It is driven out by the firft ftrong puff of team which is admitted into the cylinder, and makes a noife in its exit. This valve is therefore called the finfting valve.

To finifh our defcription, we obferve, that befides Voz. XVII. Part II.
the fafety valve 9 (called the PUPPET Clack), which is loaded with about 3 pounds on the fquare inch (though the engine will work very well with a load of 1 or 2 pounds), there is another discharger 10,10 , having a clack at its extremity fupported by a cord. Its ufe is to difcharge the fteam without doors, when the machine gives over working. There is alfo a pipe S I near the bottom of the boiler, by which it may be emp. ticd when it needs repairs or cleanfing.
There are two fmall pipes It,11, and 12,12 , with cocks called gage-pipes. The firf defcends to within two inches of the furface of the water in the boiler, and the fecond goes about 2 inches below that furface. If both cocks emit fteam, the water is too low, and requires a recruit. If neither give fteam, it is too hivh, and there is not fufficient room above it for a collection of feam. Latly, there is a filling pipe Q , by which the boiler may be filled when the machine is to be fet to work.

The engine has continued in this form for many years. The The only remer has heen thermof The only remarkable change introduced has been the the engine
manner of placing the boller. It is no longer placed las ben
continued beluw the cylinder, but at one fide, and the fleam is fer many introduced by a pipe from the top \(0^{\circ}\) the boiler into a years, the flat box immediately below the cylinder. The ufe of only change this box is merely to lodge the regulator, and give room being the for its motions. This has been a very confiderable im. puffion of provement. It has greatly reduced the height of the building. This was formerly a tower. The wall which fupported the beam could hardly be built with fufficient ftrength for withftanding the violent thocks which were repeated without ceafing; and the buildings feldom lafted more than a very few years. But the boiler is now fet up in an adjoining fhed, and the gudzeons of the main beain reft on the top of upright pofts, which are framed into the joifts which fupport the cylinder. Thus the whole moving parts of the machine are contained in one compact frame of carpentry, and have litthe or no connection with the night walls of the building, which is merely a cafe to hold the machine, and protect it from the weather.

It is now time to inquire what is to be expected from How co \({ }^{30}\) this machine, and to afcertain the moft advantageous afaertain proportion between the moving power and the load the mont that is to be laid on the machine.

It may be confidered as a great pulley, and is indeed tion befometimes fo confructed, the arches at the ends of the tween the working beam being completed to a circle. It muft be moving unequally loaded that it may move. It is loaded, du. power and ring the working ftroke, by the preffure of the atmosphcre on the pifton fide, and by the column of water to be raifed and the pump-gcar on the pump fide. During the returning ttroke it is loaded, on the pifon fidc, by a fmall part of the atmofpheric preffure, and on the pump fide by the pump gear acting as a counter weight. The load during the working ftroke muft therefore confift of the coluinn of water to be raifed and this counter weight. 'The performance of the machine is to be meafured only by the quantity of water raifed in a given time to a given height. It varies, therefore, in the joint proportion of the weight of the column of water in the pumps, and the number of ftrokes made by the machinc in a minute. Each ftroke confitts of two parts, which we have called the working and the returning ftroke. It does not, therelore, depend fimply on the velocity of the working ftroke and the
\({ }_{5} \mathrm{C}\)
quantity

Steig:Engine. the boler.

\section*{S TE}

Skeam. Fingine.
quantity of water raifed by it. If this were all that is to be attended to, we know that the weight of the co lunn of water thould be nearly \(\frac{2}{5}\) this of the preffure of the atmofphere, this being the proportion which gives the maximum in the common pulley. But the time of the returning Ifroke is a neceffary palt of the whole time elapfed, and therefore the velocity of the returning ftroke equally merits attention. This is regulated by the counter weight. The number of Atrokes per minute does not give an immediate proof of the goodnefs of the engine. A fmall load of water and a great counter weight will enfure this, becaufe thefe conditions will produce a brifk motion in both directions.The proper adjuftment of the preffire of the atmofphere on the pifton, the column of water to be raifed, and the counter weight, is a problem of very great difficulty ; and mathematicians have not turned much of their attention to the fubject, although it is certainly the molt interfting queltion that pracical mechanics affords them. upon this fuppofition, that the working and return- ing ftroke fhoul', be made in equal, times. 'This, in. deed, is generally aimed at in the erection of thefe machines, and they are not reckoned to be well arranged if it be otlierwife. We doubt of the propriety of the maxim. Suppoling, however, this condition for the prefent, we may cqmpute the loadings of the two ends of the beam as follows. Let \(a\) be the length of the inner arm of the working beam, or that by which the great pifton is fupported. Let \(b\) be the outer arm carrying the pump rods, and let \(W\) be a weight equivalent to all the load which is laid on the machine. Iet \(c^{2}\) be the area of the pifton; let II be the height of a column of water having \(c^{2}\) for its bafe, and being equal in weight to the preffure exerted by the fteam on the under lide of the pitton; and let \(b\) be the preffure of the atmofphere on the fame area, or the heipht of a column of water of equal weight. It is evident that both Itrokes will be performed in equal times, if \(b c^{2} a-\mathrm{W} b\) be equal to ( \(b-\mathrm{I}\) ) \(c^{2} a+\) W \(b\). The firft of thefe quantities is the energy of the machine during the working flroke, and the fecond expreffes the fimilar energy during the returning ftroke. This equation gives us \(\underset{W}{=}\) \(\frac{2 b c^{2} a-\mathrm{H} c^{2} a}{2 b}=\frac{(2 b-\mathrm{H}) c^{2} a}{2 b}\). If we fuppofe the arms of the lever equal and \(\mathrm{H}=b\), we have W \(=\varepsilon^{2} \frac{b}{2}\); that is, the whole weight of the outer end of the beam thould be half the preffure of the air on the great pilton. This is nearly the ufual practice; and the engineers exprefs it by faying, that the engine is loaded with feven or eight pounds on the fquare inch. Founded on ous load. This way of expreffing the matter would an errone- do well enough, if the maxim were not founded on erous maxim roneous notions, which hinder us from feeing the flate of the machine, and the circumftances on which its improvement depends. The pifton bears a preflure of \(I_{5}\) pounds, it is faid, on the fquare inch, if the vacuum below it be perfect ; but as this is far from being the cafe, we mult not load it above the power of its vacuum, which very little excceds eight pounds. But this is very far from the truth. When the cylinder is tight, the vacuum is not more than \(\frac{8}{2}\) th deficient, when the

\section*{\(754]\)}
cylinder is cooled by the injection to the degree that is every day practicable, and the pitton really bears during its defcent a preffure very near to 14 pounds on the inch. The load muft be diminifed, not on account of the im. perfect vacuum, but to give the machine a reafonable motion. We mult confider not only the moving force, but alfo the quantity of matter to be put in motion. 'This is fio great in the feam engine, that even if it were balanced, that is, if there were fufpended on the pilton arm a weight equal to the whole column of water and the counter weight, the full preffire of the atmofphere on the fteam pilton would not make it move twice as faft asit does.

This equation by Mr Boffut is moreover effentially faulty in another refpect. 'The \(W\) in the firf memberty in anm is not the fame with the W in the fecond. In the firtinher roo it is the column of water to be raifed, together with fyect. the counter weight. In the fecond it is the counter weight only. Nor is the quantity \(H\) the fame in both cafes, as is moft evident. The proper equation for enfuring the equal duration of the two ftrokes may be had in the following manner. Let it be determined by experiment what portion of the atmofpheric preffure is exerted on the great pifton during its defcent. This depends on the remaining elatticity of the feam. S::ppofe it \(\frac{9}{\mathrm{r}}\) ths: this we may exprefs by \(a b, a\) being \(=\frac{?}{1 \delta}\) ths. Let it allo be determined by experiment what portion of the atmofplieric preffure on the pitton remains unbalanced by the feam below it during its afcent. Suppofe this \(x^{i}\) th, we may exprefs this by \(b b\). Then let W be the weight of the column of water to be raifed, and \(c\) the counter weight. Then, if the arms of the beam are equal, we have the energy during the working Itroke \(=a b-W-c\), and during the returning ftroke it is \(=c-b b\). Therefore \(a-b b=a b-\) \(W-c\); and \(c=\frac{b(a+b)-W}{2}\); which, on the above fuppofition of the values of \(a\) and \(b\), gives us \(c=\) \(\frac{b-W}{2}\). We thall make fome ufe of this equation af. terwards'; but it affords us no information concerning the moft advantageous proportion of \(b\) and W, which is the material point.

We mult confider this matter in another way: And Annther that we may not involve ourfelves in unneceffary diffi- way of cor culties, let us make the cafe as fimple as poffible, and matter. fuppofe the arms of the working-beam to be of equal length.

We fhall firft confider the adjultment of things at the outer end of the beam.

Since the fole ufe of the fteam is to give room for the Adjuttaction of the atmofpheric preffure by its rapid conden- ment of fibility, it is admitted into the cylinder only to allow things at the pilton to rife again, but without giving it any im-end of the pulfe. The pump-rods muft therefore be returned to beam cono the bottom of the working barrels by means. of a pre-fidered. ponderancy at the outer end of the beam. It may be the weight of the pump rods themfelves, or may be confidered as making part of this weight. A weight at the end of the beam will not operate on the rods which are fufpended there by chains, and it muft therefore be attached to the rods themfelves, but above their refpective pump-barrels, fo that it may not lofe part of its.. efficacy by immerfion in the water. We may confider the whole under the notion of the pump-gear, and eall: it \(p\). Its office is to deprefs the-pump-rods with fuff 7

\section*{S T E [ 755 [ \(\quad\) S T E}
cient velocity, by overcoming the refiftances arifing from balanced weights on the bean and the weight of the the following caufes.
1. From the inertia of the beams and all the parts of the apparatus which are in motion during the defcent of the pumprods.
2. From the lofs of weight fuftained by the immerfion of the pump-rods in water.
3. From the friction of all the piftons and the weight of the plug-frame.
4. From the refiftance to the pifon's motion, arifing from the velocity which muft be generated in the water in pafling through the defcending piftons.

The fum of all thefe refiftances is equal to the preffure of fome weight (as yet unknown), which we may call \(m\).

When the pump-rods are brought up again, they bring along with them a column of water, whofe weight we may call zv .

It is evident that the load which muft be overcome by the preffure of the atmofphere on the fteam pifton confifts of \(w\) and \(p\). Let this load be called L, and the preffure of the air be called \(P\).
If \(p\) be \(=L\), no water will be raifed; if \(p\) be \(=0\), the rods will not defcend : therefore there is fome intermediate value of \(p\) which will produce the greateft effect.

In order to difcover this, let \(g\) be the fall of a heavy body in a fecond.

The defcending mafs is \(p\) : but it does not defcend with its full weight ; becaufe it is overcoming a fet of refitances which are equivalent to a weight \(m\), and the moving force is \(p-m\). In order to difcover the face through which the rods will defeend in a fecond, when urged by the force \(p-m\) (fuppofed couftant, notwithstanding the increafe of velocity, and confequently of \(m\) ), we mult inftitute this proportion \(p: p-m=g\) : \(\frac{g(p-m)}{p}\).

The fourth term of this analogy is the fpace required.

Let \(t\) be the whole time of the defcent in feconds. Then \(\mathrm{r}^{2}: t^{2}=\frac{g(p-m)}{p}: \frac{t^{2} g(p-m)}{p}\). This lat term is the whole defcent or length of the flroke accomplifhed in the time \(t\).

The weight of the column of water, which has now got above the pifton, is \(w,=\mathrm{L}-p\). ' i 'his mult be lifted in the next working ftroke through the fpace \(\frac{t^{2} g(p-m)}{p}\). Therefore the performance of the engine mult be \(\frac{t^{2} g(p-m)(L-p)}{p}\).

That this may be the greateft poffible, we muft confider \(p\) as the variable quantity, and make the fluxion of the fraction \(\frac{\overline{p-m} \times \overline{L-p}}{p}=0\).

This will be found to give us \(p=\sqrt{\mathrm{L} m}\); that is, the counter weight or prepondcrancy of the outer end of the beam is \(=\sqrt{1, n_{i}}\)

This gives us a method of determining \(m\) experimen. tally. We can difcover by actual meafurement the quantity \(L\) in any ongine, it being equal to the un-

\section*{water in the pumps. Then \(m=\frac{p^{2}}{\mathrm{~L}}\).}

Alfo we have the weight of the column of water \(=\mathrm{L}-p,=\mathrm{L}-\sqrt{\mathrm{L} m}\).
When therefore we have determined the load which is to be on the outer end of the beant during the working ftroke, it muft be difributed into two parts, which have the proportion of \(\sqrt{\overline{\mathrm{L} m}}\) to \(\mathrm{L}-\sqrt{\mathrm{L} m}\). The firft is the counter weight, and the fecond is the weight of the column of water.
If \(m\) is a fraction of \(L\), fuch as an aliquot part of it ; that is; if
\[
\begin{aligned}
& m=\frac{I}{I}, \frac{I}{4}, \frac{I}{9}, \frac{I}{16}, \frac{I}{25}, \& c . \\
& p=\frac{I}{1}, \frac{I}{2}, \frac{I}{3}, \frac{I}{4}, \frac{I}{5}, 8 c .
\end{aligned}
\]

The circumftance which is commonly obtruded on us by local confiderations is the quantity of water, and the depth from which it is to be raifed; that is, \(w:\) and it will be convenient to determine every thing in conformity to this.
We faw that \(w=\mathrm{L}-\sqrt{\overline{\mathrm{L} m} \text {. }}\). This gives us \(\mathrm{L}=\) \(\pm \sqrt{w m+\frac{m^{2}}{4}}+\frac{m}{2}+w\), and the counter weight \(p=\sqrt{w m+\frac{m^{2}}{4}+\frac{m}{2} .}\)

Having thus afcertained that diftribution of the load
on the onter end of the beam which produces the great-portion of on the onter end of the portion of eft effee, we come now to confider what proportion of moving moving force we muft apply, fo that it may be employ-force nay ed to the beft advantage, or fo that any experice of be applipower may produce the greateit performance. It will greateft ad be fo much the greater as the work done is greater, vantage and the power employed is lefs; and will therefore be properly meafured by the quotient of the work done divided by the power employed.
The work immediately done is the lifting up the weight L. In order to accomplifh this, ẁe muft employ a preffure P , which is greater than L. Let it be \(=\mathrm{L}+y\); alfo let \(s\) be the length of the ftroke.
If the mafs L were urged along the fpace \(s\) by the force \(L+y^{\prime}\), it would acquire a certain velocity, which we may exprefs by \(\sqrt{s}\); but it is impelled only by the force \(y\), the reft of P being employed in balancing L . The velocities which different forces generate by impelling a body along the fame \(\left\{_{\text {pace }}\right.\) are as the fquare roots of the forces. Therefore \(\sqrt{\mathrm{L}+y}: \sqrt{ } y=\sqrt{ } s\) : \(\frac{\sqrt{s y}}{\sqrt{\text { L+y }}}\). The fourth term of this analozy expreffes the velocity of the pifen at the end of the froke. The quantity of motion produced will be lad by multiplying this velocity by the mås \(L\). This gives \(\frac{\mathrm{L} x \sqrt{s y}}{\sqrt{1+y}}\); and this, divided by the power expended, or by \(\mathrm{L}+y\), gives us the meafure of the performance; namely, \(L \sqrt{s y}\)

\section*{\(\overline{\mathrm{L}+y} \times \sqrt{\mathrm{L}+y}\).}

That this may be a maximum, confiner \(y\) as the va-

seeant riable quantity, and make the fluxion of this formula Engite.
\(=0\). This will give us \(y=\frac{L}{2}\).
Now \(\mathrm{P}=\mathrm{L}+y_{,}=\mathrm{L}+\frac{\mathrm{L}}{2},=\frac{3}{2} \mathrm{~L}\). Therefore the wubole load on the outer end of the beam, confifting of the water and the counter weight, mult be \(\frac{2}{3}\) ds of the preflure of the atmofphere on the feam pifton.

We have here fuppofed that the expenditure is the atmofpheric preffure; and fo it is if we confider it mechanically. But the expenditure of which we are fenfible, and which we are anxious to employ to the beft advantage, is fuel. Suppofing this to be employed with the fame judgment in all cafes, we are alnoft intitled, by what we now know of the production of fteam, to fay that the fleam produced is proportional to the fuel expended. But the feam requifite for merely filling the cylinder is proportional to the area of the pitton, and therefore to the atmofpheric preffure. The refult of our inveltigation therefore is ftill juit ; but the fteam wafted by condenfation on the fides of the cylinder does not follow this ratio, and this is more than what is neceffary for merely filling it. This deranges our calcu. lations, and is in favour of large cylinders; but this advantage muft be in a great meafure compenfated by a fimilar variation in the production of the fteam; for in fimilar boilers of greater dimenfions the fuel is lefs advantageoufy employed, becaufe the furface to which the fuel is applied does not increafe in the ratio of the capacity, juif as the furface of the cylinder which waftes the fteam. The rule may therefore be confided in as pretty exact.

It is a fatisfactory thing to obferve thefe refults agree very well with the moft fuccefoful practice. By many changes and trials engineers have eftablifhed maxims of conftruction, which are probably not very far from the beft. It is a pretty general maxim, that the load of water thould be \(\frac{1}{2}\) of the atmofpheric preffure. - They call this loading the engine with \(7 \frac{1}{2}\) pounds on the inch, and they fay that fo fmall a load is neceffary on account of the imperfect vacuum. But we have now feen that it is neceffary for giving a reafonable wedocity of motion. Since, in this practice, \(z v\) is mate \(\frac{x}{2}\) or \(\frac{5}{x_{2}}\) the of \(P\), and \(L\) finould be \(\frac{8}{82}\) ths of \(P\), and \(L{ }^{2}\) is \(=v+p\); it follows, that the counter weight fhould be \(\frac{7}{6}\) th of \(P\); and we have found this to be nearly the cafe in feveral very good engines.

It muft be remarked, that in the preceding inveftigation we introduced a quantity M to exprefs the refiftances to the motion of the engine. This was done in order to avoid a very troublefome inveftigation. The refiftances are of fuch a nature as to vary with the velocity, and moft of them as the fquare of the velocity. This is the cafe with the refiftance arifing from the motion of the water through the piftons of the pumps, and that arifing from the friction in the long lift during the working ftrokc. Had we taken the direct method, which is fimilar to the determination of the motion thro' a medium which refifts in the duplicate ratio of the velocity, we muft have ufed a very intricate exponential calculus, which few of our readers would have the patience to look at.

But the greateft part of the quantity \(m\) fuppofes a motion already known, and its determination depends
on this motion. We muft now fhow how its differene component parts may be computed.
1. What arifes from the inertia of the moving parts is by far the moft confiderable portion of it. I'o ob-Refiltan tain it, we muft find a quantity of matter which, when to che ni placed at the end of the beam, will have the fame mo.tion of \(t\) mentum of inertia with that of the whole moving parts in enginec their natural places. Therefore (in the returning ftroke) add together the weight of the great pifton with its rod and chains; the pit pump-rods, chains, and any weight that is attached to them; the arch-heads and iron-work at the ends of the beam, and \(\frac{4}{9}\) ths of the weight of the beam itfelf; alfo the plug-beam with its arch-head and chain, multiplied by the fquare of its diftance from the axis, and divided by the fquare of hale the length of the beam; alfo the jack-head pump-rod, chain, and arch-head, multiplied by the fquare of its diftance from the axis, and divided by the fquare of the half-length of the beam. Thefe articles added into one fum may be called M, and may be fuppofed to move with the velocity of the end of the beam. Suppofe this beam to have made a fix-foot ftroke in two feconds, with an uniformly accelerated motion. In one fecond it would have moved \(1 \frac{1}{2}\) feet, and would have acquired the velocity of three feet per fecond. But in one fecond gravity would have produced a velocity of 32 feet in the fame mass. Therefore the accelerating force which has produced the velocity of three feet is nearly \({ }^{\frac{r}{r}}\) th of the weight. Therefore \(\frac{M}{I f}\) is the firf conitithent of \(m\) in the above inveltigation. If the obferved velocity is greater or lefs than three feet per fecond, this value muft be increafed or diminifhed in the fame proportion.

The fecond caufe of refiftance, viz. the immerfion of the pump-rods in water, is eafily computed, being the weight of the water which they difplace.

The third caufe, the friction of the piftons, \&c. is almoft infignificant, and muft be difcovered by experiment.

The fourth caufe depends on the ftructure of the pumps. 'Thefe pumps, when made of a proper ftrength, can hardly have the perforation of the pifton more than a fourth part of the area of the working barrel; and the velocity with which the water paffes through it is increaled at leaft \(\frac{1}{4}\) th by the contraction (fee P P MP) . The velocity of the water is therefore five times greater than that of the pifton. A pifton 12 inches diameter, and moving one foot per fecond, meets with a refiftance equal to 20 pounds; and this increafes as the fquare of the diameter and as the fquare of the velocity. If the whole depth of the pit be divided into feveral lifts, this refiftance muft be multiplied by the number of lifts, becaufe it obtains in each pump.

Thus we make up the value of \(m\); and we muft acknowledge that the method is fill indirect, becaufe it. fuppoles the velocity to be known.
We may obtain it more eafily in another way, but ftill with this circumftance of being indirect. We found. that \(p\) was equal to \(\sqrt{\mathrm{L} m}\), and confequently \(m=\frac{p^{2}}{\mathrm{~L}}\). Now in any engine \(L\) and \(p\) can always be had; and unlefs \(p\) deviates greatly from the propurtion which we determined to be the beft, the value of \(m\) thus obtained will not be very erroneous.

\section*{S T E [ 757 ] \(\quad\) S T E}

It was farther prefumed in this inveftigation, that the motions both up and down were uniformly accelerated; but this cannot be the cafe when the refiftances increafe with the velocity. This circumftance makes very little change in the working-ftroke, and therefore the theorem which determines the beft relation of \(P\) to \(L\) may be confided in. The refiftances which vary with the velocity in this cafe are a mere trifle when compared with the moving power \(y\). Thefe refiftances are, ift, The frangling of the water at the entry and at the ftanding valve of each pump. This is about 37 pounds for a pump 12 inches diameter, and the velocity one foot per fecond, increafing in the duplicate ratio of the diameter and velocity; and, 2 d , The friction of the water along the whole lift. This for a pump of the fame fize and with the fame velocity, lifting 20 fathoms, is only about \(2 \frac{3}{3}\) pounds, and varies in the fimple proportion of the diameter and the depth, and in the duplicate proportion of the velocity. The refiftance arifing from inertia is greater than in the returnines froke; becaule the M in this cafe murt contain the momentum of the water both of the pit-pumps and the jackheadpump: but this part of the refilance does not affedt the uniform acceleration. We may therefore confide in the propriety of the formula \(y=\frac{I}{2}\). And we may obtain the velocity of this ftroke at the end of a fecond with great accuracy as follows. Let \(2 g\) be the velocity communicated by gravity in a fecond, and the velocity at the end of the firf fecond of the fteam piaton's defcent will be fomewhat lefs than \(\frac{y}{\mathrm{M}^{2}} 2 g\); where M expreffes the inertia of all the parts which are in motion during the defcent of the fteam pifton, and therefore includes \(L\). Compute the two refiftances juft mentioned for this velocity. Call this \(r\). Then \(\frac{y-\frac{x}{2} r}{M} 2 g\) will give another velocity infinitely near the truth.

But the cale is very different in the returning ftroke, and the proper ratio of \(p\) to I , is not afcertained with the fame certainty: for the moving force \(p\) is not fo great in proportion to the refiftance \(m\); and therefore the acceleration of the motion is confiderably affected by it, and the motion itfelf is confiderably retarded, and in a'very moderate time it becomes fenfibly uniform: for it is precilely fimilar to the motion of a heavy body falling through the air, and may be determined in the manner laid down in the article Resistance of Fluids, viz. by an exponential calculus. We fhall content ourfelves here with faying, that the refiftances in the prefent cafe are fo great that the motion would be to all fenfe uniform before the piftons have defcended \(\frac{1}{3} \mathrm{~d}\) of their ftroke, even although there were no other circumfance to affect it.

But this motion is affected by a circumftance quite unconnected with any thing yet confidered, depending on conditions not mechanical, and fo uncertain, that we are not yet able to afcertain them with any precifion; yet they are of the utmoft importance to the good performance and improvement of the engine, and therefore deferve a particular confideration.

The counter weight has not only to puif down the pump-rods, but alfo to drag up the great pifton. This it cannot do unlefs the fteam be admitted into the cy-
linder, If the feam be no ftronger than common air, it cannot enter the cylinder except in confequence of the pitton's being dragged up. If common air were admitted into the cylinder, fome force would be required to drag up the pifton, in the fame manner as it is required to draw up the pitton of a common lyringe; for the air would rufh through the fmall entry of the cylinder in the fame manner as through the fmall nozzle of the fyringe. Some part of the atmofphenic preffure is em ployed in driving in the air with fufficient velocity to fill the fyringe, and it is only with the remainder that the admitted air preffes on the under furface of the fyringe. Therefore fome of the atmofpheric preffure on its upper furface is not balanced. This is felt by the hand which draws it up. The fame thing mult happen in the fteam-engine, and fome part of the counter weight is expended in drawing up the feam-piton. We conld tell how much is thus expended if we knew the denfity of the fteam; for this would tell us the velocity with which its elafticity would caufe it to fill the cylinder. If we fuppofe it 12 times rarer than air, which it certainly is, and the pifton rifes to the top of the cylinder in two feconds, we can demonftrate that it will enter with a velocity not lefs than 1400 feet fer fecond, whereas 500 feet is enough to make it maintain a denfity 9 ths of that of fteam in cquilibrio with the air. Hence it follows, that its. clafticity will not be lefs than \(\frac{2}{3}\) ? ths of the elafticity of the air, and therefore not more than \(\frac{1}{30}\) th of counter weight will be expended in drawing up the fteam-piton.

But all this is on the fuppofition that there is an unbounded fupply of fteam of undiminifhed elafticity. This is by no means the cafe. Immediately before opening the fteam-cock, the fteam was ifiuing through the fafe-ty-valve and all the crevices i! the top of the boiler, and (in good engines) was about \(\frac{1}{x}\) th Atronger or more elaftic than air. This had been gathering during fome. thing more than the defcent of the pifton, viz. in about three feconds. 'The pifton rifes to the top in about two feconds; therefore about \(t\) wice and a half as much fteam as fills the dome of the boiler is now fhared between the boiler and cylinder. The dome is commonly about fix times more capacious than the cylinder. If therefore no fteam is condenfed in the cylinder, the denfity of the fteam, when the pifton has reached the top, muft be about \(\frac{1}{8} \frac{5}{8}\) the of its former denfity, and fill more elaftic than air. But as much feam is condenfed by the cold cylinder, its elafticity mult be lefs than this. We cannot tell how much lefs, both becaufe we do not know how much is thus condenfed, and becaufe by this diminution of its preffure on the furface of the boiling water, it muft be more copioully produced in the boiler; but an atten. tive obfervation of the engine, will give us fome information. The moment the fleam-cock is opened we have a Arong puff of fteam through the frifting valve. At this time, therefore, it is itill more elaftic than air ; but after this, the fnifting valve remains fhut during the whole rife of the pifton, and no fteam any longer iffues through the fafety-valve or crevices; nay, the whole dome of the boiler may be obferved to fink.

45
Thefe facts give abundant proof that the elafticity of city of the the ftean during the alcent of the pifton is greatly di- fleam duminimed, and therefore much of the counter weight is ring the afo expended in dragging up the fteam-pifton in oppofition purton the to the unbalanced part of the atmofpheric pieffure. The geeatly dimotion minilhed.

42 low gnow the elafticity of the fcam in the cy. Sinder.

43
Neceffary alfo to know the flate if th eylinder during the defcent of the pifton.
motion of the returning froke is therefore fo much deranged by this foreisn and inappreciated circumftance, that it would have been quite ufelefs to engage in the intricate exponential inveftigation, and we mult fit down contented with a lefs perfect adjuftment of the counter weight and weight of water. - Any-perion who attends to the motion of a feam-engine will perceive that the cefcent of the pump-rods is fo far from being accelerated, that it is nearly uniform, and frequently it is ferfibly retarded towards the end. We learn by the way, that it is of the utmoft importance not only to have a quick production of fteam, but alfo a very capacious dome, or empty fpace above the water in the boiler. In engines where this fpace was but four or five times the capacity of the cylinder, we have always obferved a very fenfible check given to the defcent of the pump-rods after having made half their ftroke. This obliges us to employ a greater counter weight, which diminifhes the columin of water, or retards the working ftroke; it alfo obliges us to employ a ftronger fteam, at the rifk of burfting the boiler, and increafes the expence of fuel.

It would be a noft defirable thing to get an exact knowledge of the elafticity of the fleam in the cylinder; and this is by no means difficult. Take a long glafs tube exactly calibered, and clofe at the farther end. Put a fmall drop of fome coloured fluid into it, fo as to ftand at the middle nearly.-Let it be placed in a long box filled with water to keep-it of a conftant temperature. Let the open end communicate with the cylinder, with a cock between. The moment the ftean-cock is opened, open the cock of this inftrument. The drop will be pufted towards the clofe end. of the tube, while the fleam in the cylinder is more elaftic than the air, and it will be drawn the other way while it is Icfs elaftic, and, by a fcale properly adapted to it, the clafticity of the fleam correfponding to every pofition of the pifton may be difcovered. 'The fame thing may be done more accurately by a barometer properly conftructed, fo as to prevent the ofcillations of the inercury.

It is equally neceffary to know the fate of the cylinder during the defcent of the fteam-pifton. We have hitherto fuppofed \(P\) to be the full prefure of the atmofphere on the area of the pifton; fuppofing the vacuum below it to be complete. But the infpection of our table of elafticity fhowa that this can never be the cafe, becaufe the cylinder is always of a temperature far above 32 \({ }^{\circ}\). We have made many attempts to difcover its tem. perature. We have employed a thermometer in clofe contact with the fide of the cylinder, which foon acquired a A.eady temperature: this was never lefs than \(145^{\circ}\). We have kept a thermometer in the water which lies on the pillon: this never funk below \(135^{\circ}\). It is probable that the cylinder within may be cooled fomewhat lower; but for this opinion we cannot give any very fatisfactory reafon. Suppofe it cooled down to \(120^{\circ}\); this will leave an clafticity which would fupport three inches of mercury. We cannot think therefore that the unbalanced preflure of the atmofphere exceeds that of 27 inches of mercury, which is about \(13 \frac{1}{3} \mathrm{~d}\) pounds on a fquare inch, or \(10^{\frac{1}{2}}\) on a circular inch. And this is the value which we fhould employ in the equation \(\mathrm{P}=\mathrm{L}+y\). This queftion may be clecided in the fame way as the other, by a barometer connected with the infide of the cylinder.

And thus we flall learn the ftate of the moving forces in every moment of the performance, and the machine will then be as open to our examination as any water or
horfe mill ; and till this be done, or fomething equivalent, we can only guefs at what the machine is actually performing, and we cannot tell in what particulars we can lend it a helping hand. We are informed that Meffrs Watt and Boulton have made this addition to fone of their engines; and we are perfuaded that, from the information which they have derived from it, they lave been emabled to make the curious improvements from which they have acquired for much reputation and profit.

There is a circumitance of which we lave as yet taken no notice, viz. the quancity of cold water injected. Here we confefs ourfelves unable to give any precife inftructions. It is clear ar firft fight that no more than is abfolutely neceffary fhould be injected. It mult generally be fupplied by the engine, and this expends part of its power. An excefs is much more hurtful by cool ing the cylinder and pifton too much, and therefore wafting fleam during the next rife of the pifton. But the determination of the proper quantity requires a knowledge, which we have not yet acquired, of the quantity of heat contained in the fteam in a latent form. As much water mult be injected as will abforb all this without riling near to the boiling temperature. But it is of much more importance to know how far we may cool the cylinder with advantage; that is, when will the lofs of fteam, during the next rife of the pifton, compenfate for the diminution of its elafticity during its prefent defcent? Our table of elafticities thows us, that by cooling the cylinder to \(120^{\circ}\), we ftill leave an elafticity equal to \(\frac{1}{1}\) th of the whole power of the engine; if we cool it only to 140 , we leave an elafticity of \(\frac{9}{5}\) th ; if we cool it to a blood-heat, we leave an elafticity of \(\frac{3}{2}\) th. It is extremely difficult to choofe among thefe varieties. Experience, however, in forms us, that the beft engines are thofe which ufe the fmalleft quantities of injection water. We know an exceedingly good engine having a cylinder of 30 inches and a fix-fort ftroke, which works with fomething lefs than \(\frac{x}{5}\) th of a cubic foot of water at each injection; and we imagine that the quantity fhould be nearly in the proportion of the capacity of the cylinder. Defaguliers obferved, that a very good engine, with a cylinder of 32 inches, worked with 300 inches of water at each injection, which does not much exceed \(\frac{1}{6}\) th of a cubic foot. Mr Watt's obfervations, by means of the barometer, muft have given him much valuable information in this particular, and we hope that he will not always withhold them from the public.

We have gone thus far in the examination, in order feemingly to afcertain the motion of the engine when This ex3 loaded and balanced in any known manner, and in or though , der to difcover that proportion between the moving fa isfacto power and the load which will produce the greateft the atten quantity of work. 'The refult has been very unfatis-tion to th factory, becaufe the computation of the returning ft roke principal is acknowledged to be beyond our abilities. But it has given us the opportunity of directing the reader's attention to the leading circumfances in this inquiry. By knowing the internal ftate of the cylinder in machines of very different goodnefs, we learn the conneftion between the fate of the feam and the performance of the machine; and it is very poffible that the refult of a full' examination may be, that in fituations where fuel is expenfive, it may be proper to employ a weak fteam which will expend lefs fuel, although lefs work is performed

\section*{S T E [759] S TT E.}
formed by it. We fhall fee this confirmed in the cleareft manner in fome particuiar employments of the new engines invented by Watt and Boulton.
In the mean time, we fee that the squation which we gave from the celebrated Abbe Boffut is in every refpect erroneous even for the purpofe which he had in view. We alfo fee that the equation which we fubttituted in its place, and which was intended for determining that proportion between the counter-weight and the moviny force, and the load which would render the working ftroke and returning ftroke of equal duration, is alfo erroneous, becaufe thefe two motions are extremely different in kind, the one being nearly uniforin, and the other nearly uniformly accelerated. 'This being fuppofed true, it fhould follow that the counter weight fhould be reduced to one half; and we have found this to be very nearly true in fome good engines which we have examined.
We fhall add but one obfervation more on this head.
mifled him in the confruction of water-mills, efpecially of overhot mills; and, even now, he is fubmitring with hefitation and fear to the daily correction of experience.

It is needlefs to engage more deeply in fcientific calculations in a fubject where fo many of the data are fo very imperfectly underftood.

We venture to recommend as a maxim of conftruction The Ioad (fuppofing always a large boiler and plentiful fupply of of work pure fteam unmixed with air), that the load of work be be lefs that not lefs than 10 pounds for every fquare inch of the to pounds pifton, and the counterweight fo proportioned that the for every time of the returning froke may not exceed \(\frac{2}{3}\) ds of that quare incho of the working froke. A ferious objection may be of the pimade to this maxim, and it deferves mature confideration. Such a load requires the utmoft care of the machine, that no admifion be given to the common air ; and it precludes the poffibility of its working in cafe the growth of water, or deepening the pit, fhould make a greater load abfolutely neceffary. Thefe confiderations mult be left to the prudence of the enginneer. The maxim now recommended relates only to the beft actual performance of the engine.

Before quitting this machine, it will not be amifs to Rules for give fome eafy rules, fanctioned by fuccefsful practice, computing for computing its performance. Thefe will enable any the perartift, who can go through fimple calculations, to fuit of the the fize of his engine to the tafk which it is to per-fteam-enform.
gine.
'The circumftance on which the whole computation mult be founded is the quantity of water which mult be drawn in a minute and the depth of the mine; and the performance which may be expected from a good engine is at lean 12 Arokes per minute of fix feet each, working againft a column of water whofe weight is equal to half of the atmofpheric preflure on the fteam. pifton, or rather to 7,64 pounds on every fquare inch of its furface.

It is mof convenient to eftimate the quantity of water in cubic feet, or its weight in pounds, recollecting that a cubic foot of water weighs \(62 \frac{1}{2}\) pounds. The depth of the pit is ufually reckoned in fathons of fix feet, and the diameter of the cylinder and pump is ufually reckoned in inches.
Let \(Q\) be the quantity of water to be drawn per minute in cubical feet, and \(f\) the depth of the mine in fathoms; let \(c\) be the diameter of the cylinder, and \(p\) that of the pump; and let us fuppofe the arms of the beam to be of equal length.

1ft, To find the diameter of the pump, the area of the pifton in fquare feet is \(p^{2} \times \frac{0,7854}{144}\). The length of the column drawn in one minute is 12 times 6 or 72 feet, and therefore its folid contents is \(p^{2} \times \frac{72 \times 0,7854}{144}\) cubical feet, or \(p^{2} \times 0,39^{27}\) cubical feer. This muft be equal to \(Q\); therefore \(p^{2}\) mutt be \(\frac{Q}{0,3927}\) or nearly \(\mathrm{Q} \times_{2 \frac{1}{2}}\). Hence this practical rule : Multipiy the' cubic feet of water which rnuft be drawn in a minute by \(2 \frac{1}{2}\), and extract the fquare root of the product: this will be the diameter of the pump in inches.
Thus fuppofe that 58 cubic feet mult be drawn every minute ; \(5^{8}\) multiplied by \(2 \frac{1}{2}\) gives 145 , of which the

\section*{S TE E \(\quad\) [ 760 1 S T E}

Sream- fquare root is 12 , which is the required diameter of the Engine. pump.
2. To find the proper diameter of the cylinder. .

The pifton is to be loaded with 7,64 pounds on every fquare inch. This is equivalent to fix pounds on a circular inch very nearly. The weight of a cylinder of water an inch in diameter and a fathom in height is \(2 \frac{8}{\frac{1}{7}}\) pounds, or nearly 2 pounds. Hence it follows that \(6 c^{2}\) muit be made equal to \(2 f p^{2}\), and that \(c^{2}\) is equal to \(\frac{2 \int p^{2}}{6}\), or to \(\frac{f p^{2}}{3}\).

Hence the following rule: Multiply the fquare of the diameter of the pump-pifton (found as above) by the fathoms of lift, and divide the product by 3, the
fquare root of the quotient is the diameter of the cylinder.

Suppore the pit to which the foregoing pump is to be applied is 24 fathoms deep; then \(\frac{24 \times 144}{3}\) gives 1152, of which the fquare root is 34 inches very nearly:

This engine conftructed with care will certainly do the work.

Whatever is the load of zuater propofed for the engine, let 10 be the poundz on every circular inch of the fteam-pifton, and make \(c^{2}=p^{2} \times \frac{2 f}{m}\), and the fquare root will be the diameter of the fteam-pifton in inches.

To free the practical engineer as much as poffible from all tronble of calculation, we fubjoin the following Table of the Dimenfions and Porver of the Steam Engine, drawn up by Mr Beighton in 1717, and fully verified by practice fince that time. The meafure is in Englifh ale gallons of 282 cubic inches.

The firt part of the table gives the fize of the pump fuited to the growth of water. The fecond gives the fize of the cylinder fuited to the load of water. If the depth is greater than any in this table, take its fourth part, and double the diameter of the cylinder. Thus if 150 hogtheads are to be drawn in an hour from the depth of 100 fathoms, the laft column of part firft gives for 149.40 a pump of 7 inches bore. In a line with this, under the depth of 50 yards, which is \(\frac{3}{4}\) th of 100 fathoms, we find \(20 \frac{x}{2}\), the double of which is 4 I inches for the diameter of the cylinder.

It is almot impoffible to give a general rule for Etrokes of different lengths, \&c. but any one who profeffes the ability to crect an engine, fhould furely know as much arithmetic as will accommodate the rule now given to any lengih of ftroke.

We venture to fay, that no ordinary engineer can tell à priori the number per minute which an engine will give. We took 12 ttrokes of fix feet each for a ftandard, which a careful engineer may cafily accomplifh; and which an employer has a right to expect, the engine being loaded with' water to half the preffure of the atmofphere : if the load be lefs, there is fome fault -
an improper counter weight, or too little boiler, or leaks, \&c. \&c.

Such is the ftate in which Newcomen's feam-engine had continued in ufe for 60 years neglected by the philofopher, although it is the moft curious object which thod human ingenuity has yet offered to his contemplation, conve and abandoned to the efforts of the unlettered artift. its rec Its ufe has been entirely confined to the raing of water. cion in Mr Keane Fitzgerald indeed publifhed in the Philofophi-contin cal Trarfactions a method of converting its recipiocating retaro motion into a continued rotatory motion by employing motio the great beam to work a crank or a train of wheel-work. As the real action of the machine is confined to its working ftroke, to accomplifh this, it became neceffary to connect with the crank or wheeled work a very large and heavy fly, which fhould accumulate in itfelf the whole preffure of the machine during its time of action, and therefore continue in motion, and urge forward the working machincry while the fteam engine was going through its inactive returning ftroke. This will be the cafe, provided that the refiftance exerted by the working machine during the whole period of the working and returning ftroke of the fteam-engine, together.

\section*{S T E [ 7 I \(]\) S T E}
with the friction of both, does not exceed the whole preffure exerted by the fteam-engine during its working ftroke; and provided that the momentum of the fly, ariling from its great weight and velocity, be very great, fothat the refiftance of the work during one returning ftroke of the fteam eugine do not make any very fenfible diminution of the velocity of the fly. This is evidently poffible and eafy. The fly may be made of any magnitude; and being exactly balanced round its axis, it will foon acquire any velocity confiftent with the motion of the feam-engine. During the working ftroke of the engine it is uniformly accelerated, and by its acquired momentum it produces in the beam the movement of the returning ftroke; but in doing this, its momentum is fhared with the inert matter of the fteam-engine, and confequently its velocity diminifhed, but not entirely taken away. The next working ftroke therefore, by preffing on it afrefh, increafes its remaining velocity by a quantity nearly equal to the whole that it acquired during the firft ftroke. We fay nearly, but not quite equal, becaufe the time of the fecond working ftroke muft be fhorter than that of the firlt, on account of the velocity already in the machine. In this manner the fly will be more and more accelerated every fucceeding ftroke, becaufe the preffure of the engine during the working ftroke does more than reftore to the fly the momertum which it loft in producing the returning movement of the Iteam-engine. Now fuppofe the working part of the machine to be added. 'I'he acceleration of the fly during each working ftroke of the Iterm-engine will be lefs than it was before, becaufe the impelling preffure is now partly employed in driving the working machine, and becaulc the fly will lofe more of its momentum durine the returning ftroke of the feamengine, part of it being expended in driving the working machine. It is evident, therefore, that a time will come when the fucceffive augmentation of the fly's velo. city will ceafe; for, on the one hand, the continnal acceleration diminifhes the time of the next working ftroke, and therefore the time of action of theaccelerating power. The acceleration muft diminifh in the fame proportion ; and on the other hand, the refiftance of the working machine generally, though not always, increafes with its velocity. The acceleration ceafes whenever the addition made to the momentum of the fly during a working ftroke of the fteam-engine is juft equal to what it lofes by driving the machine, and by producing the returning novement of the fleam-engine.

This mutt be acknowledged to be a very important addition to the engine, and thongh fufficiently obvious, it is ingenious, and requires confiderable fkill and addrefs to make it effective (в).

The movement of the working machine, or mill of whatever kind, muft be in fome degree hobbling or Vol. XVII. Part II.
unequal, But this may be made quite infenfible, by ma. king the fly cxceedingly large, and difpofing the greateft part of its weight in the rim. By thefe means its momentum may be made fo great, that the whole force required for diving the mill and producing the returning movement of the engine may bear a very fmall pro. portion to it. The diminution of its velocity will thers be very trifling.

No counter weight is neceffary here, becaufe the returning movement is produced by the iilertia of the fly. A counter weight may, however, be employed, and fhould be employed, wiz. as much as will produce the returning movement of the fteam-engine. It will do this better than the fame force accumulated in the fly; for this force mult be accumulated in the fly by the intervention of rubbing parts, by which fome of it is loit ; and it mult be afterwards returned to the en. gine with a fimilar lofs. But, for the fame reafon, it would be improper to make the counter weight alfo able to drive the mill during the returning ftroke.

By this contrivance Mr Fitzgerald hoped to render the fteam-engine of moft extenfive ufe; and he, or others affociated with him, obtained a patent excluding all others from employing the feam-engine for turning a crank. They alfo publifhed propofals for erecting miths of all kinds driven by fteam-engines, and ftated very fairly their powers and their advantages. But their propofals do not feem to have acquired the confidence of the public; for we do not know of any mill ever having been erected inder this patent.
'The great obftacle to this extenfive of the A 53 engine is the prodigious expenfe of fuel. An engine expenfe of having a cylinder of four feet diameter, working night fuel and day, cenfumes about 3400 chaldron (London) of good coals in a year.

This circumftance limits the ufe of feam-engines ex- Limits the ceedingly. T'o draw water from coal-pits, where they ufe of can be ttocked with unfaleable finall coal, they are of fleam-enuniverfal employment : alfo for valuable mines, for gince. fupplying a great and wealthy city with water, and a few other purpofes where a great expence can be borne, they are very proper engines; but in a thoufand cafes where their unlimited powers might be vaftly ferviceable, the enormous expenfes of fuel completely excludes them. We cannot doubt but that the attention of en. gineers was much directed to every thing that could pro. mife a diminution of this expenfe. Every one had his particular noftrum for the conftruction of his furnace. and fome were undoubtedly more fuccefsful than others. But fcience was not yet fufficiently advanced: It was not till Dr Black had made his beautiful difcovery of latent heat, that we could know the intimate relation between the heat expended in boiling off a quantity of water and the quantity of feam that is produced.
(B) We do not recollect at prefent the date of this propofal of Mr Fitzgerald; but in 1781 the Abbe Arnal, canon of Alais in Languedoc, entertained a thought of the fame kind, and propofed it for working lighters in the inland navigations; a fcheme which has been fuccefsfully practifed (we are told) in America. His brother, a major of engincers in the Auftrian fervice, has carried the thing much farther, and applied it to manufactures; and the Aulic Chamber of Mines at Vienna has patronized the project: (See Fournal Encyclopedique, \({ }^{1781}\) ). But thefe fchemes are long pofterior to MrFitzgerald's patent, and are even later than the crection of feveral machines driven by fteam engines which have been erected by Meffrs Watt and Boulton. We think it our duty to ftate thefe particulars, becaufe it is very ufual for our neighbours on the continent to affume the credit of Britifh inventions.

\section*{S T F}

SteamEugine. Mirch about the time of this difcovery, viz. 1763 , Mr James Watt, eftablifhed in Glafgow in the commercial line, was amufing himfelf with repairing a working model of the fteam-encine which belon eed to the philofophical apparatus of the univerfity. Mr Watt was a perfon of a truly philofophical mind, eminently converfant in all branches of natural knowledge, and the pupil and intimate friend of Dr Black. In the courfe of the above-mentioned amufement many

Mr Wat difcovers that fleam contains an innienfe quantity of heat
cylinder,
curious facts in the production and condenfation of fteam occurred to him; and among others, that remarkable fact which is always appealed to by Dr Black as the proof of the immenfe quantity of heat which is contained in a very minute quantity of water in the form of elaftic fleam. When a quantity of water is heated feveral degrees above the boiling point in a clofe digefter, if a hole be opened, the fteam rufhes out with prodigious violence, and the heat of the remaining water is reduced, in the courfe of three or four feconds, to the boiling temperature. The water of the fteam which has iffued amounts only to a very few drops; and yet thefe have carried off with them the whole excefs of heat from the water in the digefter.

Since then a certain quantity of fteam contains fo great a quantity of heat, it muft expend a great quantity of fuel ; and no conftruction of furnace can prevent this. Mr Watt therefore fet his invention to work to difcover methods of hufbanding this heat. The cylinder of his little model was heated almoft in an inftant, fo that it could not be touched by the hand. It could not be otherwife, becaufe it condenfed the vapour by abftracting its heat. But all the heat thus communicated to the cylinder, and wafted by it on furrounding bodies, contributed nothing to the performance of the engine, and muft be taken away at every injection, and again communicated and wafted. Mr Watt quickly undertood the whole procefs which was going on within the cylinder, and which we have confidered fo minutely, and faw that a very confiderable portion of the fteam muft be wafted in warming the cylinder. His firf attempts were made to afcertain how much was thus wafted, and he found that it was not lefs than three or four times as much as would fill the cylinder and work the engine. He attempted to diminifh this wafte by ufing wooden cylinders. But though this produced a fenfible diminution of the wafte, other reafons forced him to give them up. He then caled his metal cylinders in a wooden cafe with light wood afhes between. By this, and ufing no more injection than was abfolutely neceffary for the condenfation, he reduced the wafte almoft one half. But by ufing fo fmall a quantity of cold water, the infide of the cylinder was hardly brought below the boiling temperature; and there confequently remained in it a feam of very confiderable elatticity, which robbed the engine of a proportional part of the atmofpherical preffire. He faw that this was unavoidable as long as the condenfation was performed in the cylinder. The thought ftruck. him to attempt the condenfation in another place. His firf experiment. was made in-the fimpleft manner. A globular weffet communicated by means of a long pipe. of one inch diameter with the bottom of his. little cylinder of four inches diameter and 30 inches long. This pipe had a ftop-cock, and the globe was immerfed in a veffel of cold.water. When the pifton was at the top,
and the cylinder filled with ftrong fteam, he turned the cock. It was fcarcely turned, nay he did not think it completely turned, when the fides of his cylinder (only ftrong tin-plate) were crufhed together like an empty bladder. This furprifed and delighted him. A new cylinder was immediately made of brafs fufficiently thick, and nicely bored. When the experiment was repeated with this cylinder, the condenfation was fo rapid, that he could not fay that any time was expended in it. But the molt valuable difcovery was, that the vacuum in the cylinder was, as he hoped, almoft perfeet. Mr Watt found, that when he ufed water in the boiler purged of air by long boiling, nothing that was very fenfibly inferior to the preffure of the atmofphere on the pifton could hinder it from coming quite down to the bottom of the cylinder. This alone was gaining a great deal, for in moft engines the remaining elafticity of the fteam was not lefs than \(\frac{1}{8}\) th of the atmofpherical preffure, and therefore took away \(\frac{x}{8}\) th of the power of the engine.

Having gained this capital point, Mr Watt found many difficulties to ftruggle with before he could get \(m\) ind res the machine to continue its motion. The water pro difficulo duced from the condenfed fteam, and the air which was which extricated from it, or which penetrated through un- impled avoidable leaks, behoved to accumulate in the con-mprev b denfing veffel, and could not be voided in any way fimi-means lar to that adopted in Newcomen's engine. He took pumps another method: He applied pumps to extract both, which were worked by the great beam. The contrivance is eafy to any good mechanic ; only we muft obferve, that the pifton of the water-pump mult be under the furface of the water in the condenfer, that the water may enter the pump by its own weight, becaufe there is no atmofpherical preffure there to force it in. We muft alfo obferve, that a confiderable force is neceffarily expended here, becaufe, as there is but one ftroke for rarefying the air, and this rarefaction mult be nearly complete, the air-pump muft be of large dimenfions, and its pitton muft act againft the whole preffure of the atmofphere. Mr Watt, however, found that this force could be eafily fpared from his machine, already fo much improved in refpect of power.
Thus has the fteam-engine received a very confiderable improvement. The cylinder may be allowed to remain very hot; nay, boiling hot, and yet the contions on denfation be completely performed. The only elaftic of thefe fteam that now remains is the fmall quantity in the pipe coverie of communication. Even this fmall quantity Mr Watt at laft got rid of, by admitting a fmall jet of cold water up this pipe to meet the fteam in its paffage to the condenfer. This both cooled this part of the apparatus. in a fituation where it was not neceffary to warm it again, and it quickened the condenfation. He found at laft that the fmall pipe of communication was of it felf fufficiently large for the condenfation, and that no feparate veffel, under the name of condenfer, was neceffary. This circumftance fhows the prodigious rapidity of the condenfation. We may add, that unlefs this had been the cafe, his.improvement would have been. vaftly diminifhed; for a large condenfer would have required a much larger air-pump, which would have expended much of the power of the engine. By thefe means the vacuum below the pifton is greatly improved: for it will appear clear to any perfon who underftands the fubject, that as long as any part of the condenfer is.

\section*{S TE}
ame. kept of a low temperature, it will abitract and condenfe the vapour from the warmer parts, till the whole acquires the elarticity correfponding to the coldelt part. By the fame means much of the walte is prevented, becaufe the cylinder is never cooled much below the boiling temperature. Many engines have been erected by Mr Watt in this form, and their performance gave univerfal fatisfaction,
We have contented ourfelves with giving a very flight defcription without a figure of this improved engine, becaule we imagine it to be of very eafy compreheution, and becaufe it is only a preparation for fill greater improvements, which, when undertood, will at the fame time leave no part of this more fimple form unexplained.
During the progrefs of thefe improvements MrWatt made many experiments on the quantity and denfity of the fteam of boiling water. Thefe fully convinced him, fthat although he had gieatly diminifhed the wafte of fteam, a great deal yet remained, and that the fteam expended during the rife of the pifton was at leaft three times more than what would fill the cylinder. The caufe of this was very apparent. In the fubfequent defcent of the pitton, covered with water much below the boiling temperature, the whole cylinder was neceefarily cooled and expofed to the air. Mr Watt's fertile genius inmediately fuggefted to him the expedient of employiug the elatticity of the fleam from the boiler to impel the pifton down the cylinder, in place of the preffure of the atmofphere; and thus he reflored the engine to its firt principles, making it an engine really moved by feam. As this is a new epoch in its hiftory, we fhall be more particular in the defcription; at the fame time ftill reftricting ourfelves to the effential circumftances, and avoiding every peculiarity which is to be found in the prodigious varieties which Mr Watt has introduced into the machines which he has erected, every individual of which has been adapted to local circumflances, or diverifified by the progrefs of Mr Watt's improvements.

Let A (fig. 9.) reprefent the boiler. This has received great improvements from his complete acquaintance with the procedure of nature in the production of fteam. In fome of his engines the fuel has been placed in the midft of the water, furrounded by an iron or copper veffel, while the exterior boiler was made of wood, which tranfmits, and therefore waftes the heat very flowly. In others, the flame not only plays round alo whole outfide, as in common boilers, but alfo runs along feveral flues which are conducted through the midit of the water. By fuck contrivances the fire is applied to the water in a moft extenfive furface, aud for a long time, fo as to impart to it the greateft part of its heat. So fkilfully was it applied in the Albion Mills, that although it was perhaps the largett engine in the kingdom, its unconfumed fmoke was inferior to that of a very fmall brew-houfe. In this fecond engine of Mr Watt, the top of the cylinder is 隹ut up by a ftrong metal plate \(\mathrm{g} h\), in the middle of which is a collar or box of leathers \(k l\), formed in the ufual manner of a jackhead pump, through which the pifton rod PD, nicely turned and polifhed, can move up and down, without allowing any air to pafs by its fides. From the dome of the boiler proceeds a large pipe BCIOQ, which, after reaching the cylinder with its horizontal part BC ,
defeends paralle! to its fide, fending of two branches, vix. IM to the top of the cylinder, and ON to ita bottom. At I is a puppet valve opening from be low upwards. At L, immediately below this branch, there is a fimilar valve, alfo opening from below upwards. The pipe defcends to \(Q\), near the bottom of a large ciftern \(c d e f\), filled with cold water conftantly renew ed. The pipe is then continued horizontally along the bottom of this ciftern (but not in contact), and terminates at R in a large pump \(\mathrm{S}^{\prime} \mathrm{L}\) '. The piton S has clack valves opening upwards, and its rod \(S s\), paffing through a collar of leathers at \(T\), is fufpended by a chain to a fmall arch head on the outer arm of the beam. There is a valve \(R\) in the bottom of this pump, as ufual, which opens when preffed in the direction \(Q R\), and fhuts againtt a contrary preffure. This pump delivers its contents into another pump \(\mathrm{X} Y\), by means of the fmall pipe \(t \mathrm{X}\), which proceeds from its top. This fe cond pump has a valve at \(X\), and a clack in its pir. ton \(Z\) as ufual, and the pifton \(\operatorname{rod} Z z\) is fufpended from another arch head on the outer arm of the beam. The two valves I and \(L\) are opened and fhut by means of fpanness and handles, which are put in motion by a plug frame, in the fame manner as in Newcomen's en. gine.

Lafly, there may be obferved a crooked pipe \(a b o\), which enters the upright pipe laterally a little above \(Q\). This has a fmall jet hole at 0 ; and the otherend \(u\), which is confiderably under the furface of the water of the condenfing cittern, is covered with a puppet valve \(v\), whofe long flalk \(v u\) rifes above the water, and may be railed or lowered by hand or by the plug beam. The valves R and X and the clacks in the piltons S and Z are opened or fhut by the preffures to which they are immediately expofed.

This figure is not an exact copy of any of Mr Watt's engines, but has its parts fo difpoied that all may come diftinctly into view, and exactly perform their various functions. It is drawn in its quiefcent pofition, the outer cnd of the beam preponderating by the counter weight, and the pitton P at the top of the cylinder and the piftons S and Z in their lowett fituations.

In this fituation let us fuppofe that a vacuum is (by any means) produced in all the fpace below the pifton, the valve I being fhut. It is evident that the valve R will alfo be fhut, as alfo the valve \(w\). Now let the valve I be opened. The fteam from the boiler, as elaftic as common air, will rufh into the fpace above the pifton, and will exert on it a preffure as great as that of the atmofphere. It will therefore prefs it down, raife the outer end of the beam, and caufe it to perform the fame work as an ordinary engine.

When the pifton \(P\) has reached the bottom of the cylinder, the plug frame fhuts the valve I, and opens L. By fo do:ng the communication is open between the top and bottom of the cylinder, and nothing hin ders the fleam which is above the pifton from going along the paffage MLON. The pilton is now equally affected on both fides by the fleam, even though a part of it is continually condenfed by the cylinder, and in the pipe IOQ. Nothing therefore hinders the pifton from being dragged up by the counter weight, which acts with its whole force, undiminifhed by any remaining unbalanced elafticity of fteam. Here therefore this form of the engine has an advantage (and by no means 5 D 2

Sceam. Engine.

\section*{S T E}

Steam. a Imall one) over the common engines, in which a great part of the courter weight is expended in overcoming unbalanced atmofpheric preffure.

Whenever the pifton \(P\) arrives at the top of the cylinder, the valve \(L\) is fhut by the plug frame, and the valves I and \(v\) are opened. All the fpace below the pifton is at this time occupied by the fteam which came from the upper part of the cylinder. This being a litthe wafted by condenfation, is not quite a balance for the, preffure of the atmofphere. Therefore, during the afcent of the pifton, the valve \(R\) was fhut, and it remains fo. When, therefore, the valve \(v\) is opened, the cold water of the ciftern muft fpout up through the hole \(n\), and condenfe the fleam. To this muft be added the coldnefs of the whole pipe OQS. As faft as it is condenfed, its place is fupplied by fieam from the lower part of the cylinder. We have already remarked, that this fucceffive cordenfation is accomplifhed with aftonifhing rapidity. In the mean time, iteam from the boiler preffes on the upper furface of the pitton. It muft therefore defcend as before, and the cngine muft perform a fecond working ftroke.

But in the mean time the injection water lies in the bottom of the pipe Q Q R, heated to a confiderable degree by the condenfation of the fteam; alfo a quantity of air has been difengaged from it and from the water in the boiler. How is this to be difcharged?This is the office of the pumps S T and X Y. The capacity of ST is very great in proportion to the fpace in which the air and water are lodsed. When, therefore, the pifton \(S\) has got to the top of its courfe, there mult be a vacuum in the barrel of this pump, and the water and air mull open the valve R and come into it. When the pifton \(S\) comes down again in the next returning ftroke, this water and air gets through the valve of the pifton; and in the next working ftroke they are difcharged by the pifton into the pump X Y, and raifed by its pitton. The air efcapes at \(Y\), and as much of the water as is neceffary is delivered into the boiler by a fmall pipe \(Y g\) to fupply its wafte. It is a matter of indifference whether the piftons \(S\) and \(Z\) rife with the outer or inner end of the beam, but it is rather better that they rife with the inner end. They are othervife drawn here, in order to detach them from the reft and fhow. them more diftinetly.

Such is Mr Watt's fecond engine. Let us examine its principles, that we may fee the caufes of its avowed

62
Caufes of its huperio. xity over conmon emgines are the full opepation of the couluter weight, and great fuperiority over the common engines.
We have already feen onc ground of fuperiority, the full operation of the counter weight. We are authorized by careful examination to fay, that in the common engines at leaft one-half of the counter weight is expended in counteracting an unbalanced preffure of the air on the pitton during its afcent. In many engines, which are not the worft, this extends to \(\frac{1}{5}\) th of the whole preffure. This is evident from the examination of the engine at Montrelais by Boffut. This makes a very great counter weight neceffary, which exhaufts a proportional part of the moving force.
But the great advantage of Mr Watt's form is the almoft total annililation of the wafte of feam by condevifation in the cylinder. The cylinder is always boiling hot, and therefore perfectly dry. "This mult be evident to any perfon who underitands the fubject. By the sime that Mr Watt had completed his improvements, his
experiments on the production of fteam had given him a pretty accurate knowledge of its denfity ; and he found himfelf authorized to fay, that the quantity of fteam employed did not exceed twice as much as would fill the cylinder, fo that not above one-half was unavoidably wafted. But before he could bring the engine to this degree of perfection, he had many difficulties to overcome: He inclofed the cylinder in an outer wooden cafe at a fmall ditance from it. This diminifhed the expence of heat by communication to furrounding bodies. Somctimes he allowed the feam from the boiler to occupy this interval. I'his undoubtedly prevented all diffipation from the inner cylinder: but in its turn it diffipated much heat by the outer cafe, and a very fennfible condenfation was obferved between them. This has occalioned him to onit this circumftance in fome of his beft engines. We believe it was omitted in the Albion Mills. -

The greateft. difficulty was to make the great pifton tight. The old and effectual method, by water lying on it, was inadmiffible. He was therefore oblied to have his cylinders moft nicely bored, perfectly cylindrical, and finely polifhed; and he made numberlefs trials of different foft fubitances for packing his piton, which hould be tight without enormous friction, and which fhould long remain fo, in a fituation perfectly dry, and hot almoft to burning.

After all that Mr Watt has done in this refpect, he thinks that the greateft part of the wafte of team which he ftill perceives in his engines arifes from the unavoidable efcape by the fides of the pifton during its de-
fcent.

But the fact is, that an engine of this conftruction, of the fame dimenfions with a common, engine, making the fame number of ftrokes of the fame extent, does not confume above one fourth part of the fuel that is confumed by the belt engines of the common form. It is alio a very fortunate circumftance, that the performance of the engine is not immediately deftroyed, 110 indeted fenfibly diminifhed, by a fmall want of tightnefs in the pifton. In the common engine, if air get in, in this way, it immediately puts a ftop to the work; but althourg even a confiderable quantity of fteam get paft the pifton during its defcent, the rapidity of condenfation is fuch, that hardly any diminution of preflure can be obferved, and the wafte of fteam is the only inconvenience.

Mr Watt's penetration foon difcovered another moft valuable property of this engine. When an engine of the common form is erected, the engineer muft nake valuable accurate eftimate of the work to be performed, and of it mult proportion his engine accordingly. He muft be careful that it be fully able to execute its tafk; but its power muft not exceed its load in any extravagant degree. This would produce a motion which is too rapid, and which, being alternately in oppofite directions, would occation jolts which no building or machinery. could withftand. Many engines have been fhattered by the pumps diawing air, or a pump-rod breaking; by: which accidents the fteam-pifton defcends with fuch rapidity that every thing gives way. But in molt operations of mining, the tafle of the engine increafes, and it muft be fo conftructed at firft as to be able to bear this addition. It is very difficult to manage an engine that is much fuperion to its talk; and the eafief way is;

Steam Engine

\section*{S T E \(\quad\) 「 765 J S T E}
ream- to have it almof full loaded, and to work it only during
a few hours each day, and allow the pit water to accumulate during its repofe. This increafes the firt coft, and waftes fuel during the inaction of the engine.
But this new engine can at all times be exactly fitted (at leaft during the working ftroke) to the load of work - that then happens to be on it. We lave only to adminifter fteam of a proper elafticity. At the firft erection the engine may be equal to twice its tafk, if the fleam admitted above the cylinder be equal to that of common boiling water ; but when once the ebullition is fairly commericed, and the whole air expelled from all parts of the apparatus, it is evident, that by damping the fire, fteam of half this elafticity may be continually fupplied, and the water will continue boiling although its tempelature does not exceed. \(185^{\circ}\) of Fahrenheit's the:mometer. This appears by infpecting our table of vaporous elafticity, and affords another argument for rendering that table more accurate by new experiments. We hope that Mr Watt will not withhold from the public the knowledwe which he has acquired on this fubject. It may very pofiribly refult from an accurate inveftigation, that it would be advifable to work our fteam-engines with weak fteams, and that the diminution of work may be more than compenfated by the diminution of fuel. It is more probable 'indeed, and it is Mr Watt's opinion, that the contrary is the cafe, and that it is much more economical to employ great heats. At any rate, the decifion of this queftion is of great importance for improving the engine; and we fee, in the mean time, that the engine can at all times be fitted fo as to perform its tafk with a moderate and manageable motion, and that as the tafk increafes we can increafe the power of the engine.

But the method now propofed has a great inconvenience. While the fteam is weaker than the atmofphere, there is an external force tending to fqueeze in the fides and bottom of the boiler. This could not be refifted when the difference is confiderable, and common air would rufh in through every crevice of the boiler and foon choke the engine : it muft therefore be given up.
But the fame effeet will be produced by diminifhing the paffage for the fteam into the cylinder. For this purpofe, the puppet valve by which the fteam enters the eylinder was made in the form of a long taper fpigot, and it was lodyed in a conc of the fame fhape ; confequently the paffage could be enlarged or contracted at pleafure by the ditance to which the irner cone was drawn up.
In this way feveral engines were conffructed, and the general purpofe of fuiting the power of the engine to its tafk was completely anifwered; but (as the mathemati cal reader will readily perceive) it was extremely difficult to make this adjuftment precife and corftant. In a great machine like this. going by jerks, it was hardly poffble that every furccefive motion of the valve fhould be precifely the fame. This occafioned very fenfible irregularities in the motion of the engine, which increafed and became hazardous when the joints worked loofe by long ufe.

Mit Watt's genius, always fertile in refources, found dut' a complete remedy for all thefe inconvenienices. Making the valve of the ordinaty form of a puppet clack, he adjulted the button of its falk or' tail to that it fhould always oper full to the fame height. He then
regulated the pins of the plur-frame, in fuch a manner that the valve fhould fhut the moment that the pifon had defeended a certain proportion (fuppofe one-fourth, one-third, one-half, \&c.) of the cylinder. So far the cylinder was occupied by fteam as elattic as common air. In prefing the pilton farther down, it behoved the flean to expand, and its elafticity to diminifh. It is plain that this could be done in any degree we pleafe, and that the adjuftment can be variec ir a minute, according to the exigency of the cafe, by moving the plug pins.

In the mean time, it muft be obferved, that the preffure on the pifton is continually changing, and confe. quently the accelerating force. The motion therefore will no longer be uniformly accelerated: it will approach much fafter to uniformity ; nay, it may be retarded, becaufe although the prefure on the pifton at the beginning of the ffroke may exceed the refiltance of the load, yet when the pifton is near the bottom the refiftance may exceed the preffire. Whatever may be the law by which the preffure on the pifton varies, an ingenious meclantic may contrive the connecting michinery in fuch a way that the chains or rods at the outer end of the beam fhall continually exert the fartue preffure, or fhall vary their preffure according to any law he firds moft convenient. It is in this manner tlat the watchmaker, by the form of the fuzee, produces an equal preffure on the wheel-work by means of a very unequal action of the main-lpring. In like manner, by making the outer arch heads portions of a proper fpiral inftead of a circle, we can regulate the force of the beam at pleafure.

Thus we fee how much more manageable an engine is in this forn than Nev:comen's was; and alfo more eafily inveftigated in refpect of its power in its various pofitions. The knowledge of this lalt circumfiance was of mi hhty confequence, and without it no notion could be formed of what it could perform. This fuggefted to Mr Watt the ufe of the barometer communicating with the cylinder; and by the knowledge acquired by thefe means has the machine been fo much: improved by its ingenious inventor.
We muft not omit in this place one deduction made by Mr Watt from his obfervations, which may be celled a difcovery of great importance in the theory of the. engine.
Let ABCD (fig. 10.) reprefent a fection of the cy* difoverf linder of a fleam-engine, and EF the furface of its pi- of Mr fton. Let us fuppofe that the fteam was admitted Wratt of while EF was in contact with \(A B\), and that as foon as poratice ins it had preffed it down to the fituation EF the fteam she tilicor; cock is fhut. The fteam will continue to prefs it down, of the elland as the fteam expands its preffure diminifhes. We gine. may exprefs its preffure (exerted all the while the pifton moves from the fituation \(A B\) to the fituation EF ) by the line EF. If we fuppofe the elaflicity of the ftean proportional to its denlity, as is nearly the cafe with air, we may exprés's the preffure on the pifton in any other pofition, fuck as KL or DC , by \(\mathrm{K} l\) anid \(\mathrm{D} c\), the ordinates' of a rectangular hyperbola \(\mathrm{F} / \mathrm{c}\), of which \(A E, A B\) are the affymptotes, and \(A\) the centre. The accimulated preflure during the motion of the pifton from EF to DC will be expieffed by the area EF \(c \mathrm{DE}\); and the preflure during the whole notion by the area ABF CDA.

TE日解 Erigine．
equal to \(A B F E\) multiplied by the hyperbolic loga rithm of \(\frac{A D}{A E},=L \frac{A D}{A E}\) ，and the whole arca \(A B F\) \(c \mathrm{DA}\) is \(=\mathrm{ABFE} \times\left(I+L: \frac{A D}{\mathrm{AE}}\right)\) ．

Thus let the diameter of the pifton be 24 inches， and the preffure of the atmofphere on a fquare inch be 14 pounds ；the preffure on the pifton is 6333 pounds． Let the whole ftroke be 6 feet，and let the fteam be ftopped when the pifton has defcended 18 inches，or 1,5 feet．The hyperbolic logarithm of \(\frac{6}{1,5}\) is 1,3862943 ． Therefore the accumulated preffure \(\mathrm{ABF} \subset \mathrm{DA}\) is \(=\) \(6333 \times 2,3^{862943}=15114\) pounds．

As few profeflional engineers are poffeffed of a table of hyperbolic logarithms，while tables of common lo－ garithms are or fhould be in the hands of every perfon who is much engaged in meclianical calculations，let the following method be practifed．Take the common logarithm of \(\frac{\Lambda D}{A E}\) ，and multiply it by 2,3026 ；the pro． duct is the hyperbolic logarithm of \(\frac{A D}{A E}\) ．

The accumulated preffure while the piton moves from \(A B\) to EF is \(633 \times 1\) ，or fimply 6333 pounds． Therefore thie fleam while it expands into the whole cylinder aeds a preffure of 878 I pounds．

Suppofe that the fteam had got free admiffion during the whole defcent of the pifton，the accumulated prei－ fure would have been \(6333 \times 4\) ，or \(2533^{2}\) pounds．
Here Mr Watt obferved a remarkable refult．The iteam expended in this cafe would have been four times greater than when it was fopped at \(\frac{1}{4}\) th，and yet the accumulated preffure is not twice as great，being nearly \(\frac{5}{3}\) ds．One－fourth of the feam performs nearly \(\frac{3}{3}\) ths of the work，and an equal quantity performs more than twice as much work when thus admitted during \(\frac{1}{4}\) th of the motion．
This is a curious and an important information，and the advantage of this method of working a fteam－engine increafes in proportion as the fteam is fooner ftopped； but the increafe is not great after the fleam is rarefied four times．The curve approaches near to the axis， and fmall additions are made to the area．The ex－ penfe of fuch great cylinders is confiderable，and may sometimes compenfate this advantage．

It is very pleafing to obferve fo many unlooked． for advantages refulting from an improvement made with the fole view of leffening the wafte of fteam by condenfation．While this purpofe is gained，we learn how to hublband the fleam which is not thus wafted． The engine becomes more manageable，and is more eafily adapted to every variation in its tafk，and all its powers are more eafily computed．

The active mind of its ingenious inventor did not fop here：It had always beẹ matter of regret that one half of the motion was unaccompanied by any work．It was a very obvious thing to Mr Watt，that as the fleam admitted above the pilton preffed it Cown， fo fteam admitted below the pifton preffed it up with the fame force，provided that a vacuum were inade on its upper fide．This was eafily done，by connecting the lower end of the cylinder with the boiler and the upper end with the condenfer．

Fig．11．is a reprefentation of this conftruction ex． actly copied from Mr Watt＇s figure accompanying his fpecification．Here BB is a fection of the cylinder， furrounded at a fmall diftance by the cafe ri11．The fection of the pifton A ，and the collar of leathers which of Mr embraces the pifton rod，gives a diftinct notion of its fteam－e conffruction，of the manner in which it is connected \(\mathrm{g}_{\mathrm{in}}\) in with the pitton rod，and how the packing of the pifton and collar contributes to make all tight．
From the top of the cylinder proceeds the horizon－ tal pipe．Above the letter \(D\) is obferved the feat of the fteam valve，communicating with the box above it． In the middle of this may be obferved a dark fladed circle．＇This is the mouth of the upper branch of the fteam pipe coming from the boiler．Beyond D ，below the letter N ，is the feat of the upper condenfing valve． The bottom of the cylinder is made fpherical，fitting the pifton，fo that they may come into entire contact．An other horizontal pipe proceeds from this bottom．A． bove the letter \(E\) is the feat of the lower feam valve， opening into the valve box．This box is at the extre－ mity of another fteam pipe marked C ，which branches off from the upper horizontal part，and defcends ob－ liquely，coming forward to the eye．The lower part is reprefented as cut open，to fhow its interior confor－ mation．Beyond this itteam valve，and below the letter F ，may be obferved the feat of the lower conden． fing valve．A pipe defcends frona hence，and at a fmall diftance below unites with another pipe GG，which comes down from the upper condenfing valve N ． Thefe two eduction－pipes thus united ge downwards， and open at \(L\) into a rectangular box，of which the end is feen at \(L\) ．This box goes backward from the eye，and at its farther extremity communicates with the air－pump K，whofe pifton is here reprefented in fection with its butterfly valves．The piton delivers the water and air laterally into another rectangular box M，darkly fhaded，which box communicates with the pump I．The pifton－rods of this and of the air－pump are fulpended by chains from a fmall arch head on the inner arm of the great beam．The lower part of the eduction－pipe，the horizontal box \(L\) ，the air－pump \(K\) ， with the communicating box \(M\) between it and the pump I，are all immerfed in the cold water of the con－ denfing ciltern．The box \(L\) is made flat，broad，and fhallow，in order to increafe its furface and accelerate the condenfation．But that this may be performed with the greatef expedition，a fmall pipe H ，open be－ low（but occafionally ftopped by a plug valve），is infert－ ed laterally into the eduction－pipe G ，and then divides into two branches；one of which reaches within a foot or two of the upper valve N ，and the other approaches as near to the valve \(F\) ．
As it is intended by this conftruction to give the pi－ fton a ftrong impulfe in both directions，it will not be

\section*{S T E}
proper to fufpend its rod by a chain from the great beam; for it mult not only pull down that end of the beam, but alfo pufh it upwards. It may indeed be fufpended by double chains like the piftons of the engines for extinguifhing fires; and Mr Watt has accordingly done fo in fome of his engines. But in his drawing from which this figure is copied, he has communicated the force of the pifton to the beam by means of a toothed rack OO, which engages or works in the toothed fector QQ on the end of the beam. 'Ihe reader will underfand, without any farther explanation, how the impulfe given to the pifton in either direction is thus tranfmitted to the beam without diminution. The fly XX, with its pinion Y, which allo works in the toothed arch QQ, may be fuppofed to be removed for the prefent, and will be confidered afterwards.

We thall take the prefent opportunity of defcribing Mr Watt's method of communicating the force of the fteam-engire to any machine of the rotatory kird. VV reprefents the rim and arms of a very laige and heavy metalline fly. On its axis is the concentric toothed wheel U. There is attached to the end of the great beam a ftrong and ftiff rod TT, to the lower end of which a toothed wheel W is firmly fixed by two bolts, fo that it cannot turn round. This wheel is of the fame fize and in the fame vertical plane with the wheel \(U\); and an iron link or ftrap (which cannot be feen here, becaule it is on the other fide of the two wheels) connects the centres of the two wheels, fo that the one cannot quit the other. The engine being in the pofition reprefented in the figure, fuppofe the fly to be turned once round by any external force in the direction of the darts. It is plain, that fince the toothed wheels cannot quit each other, being kept together by the link, the inner half (that is, the half next the cylinder) of the wheel \(U\) will work on the inner half of the wheel \(W\), fo that at the end of the revolution of the Ay the wheel \(W\) muft have got to the top of the wheel U , and the outer end of the beam mult be raifed to its higheft pofition. The next revolution of the fly will bring the wheel \(W\) and the beam connected with it to their firlt pofitions; and thus every two revolutions of the fly will make a complete period of the beam's reciprocating movements. Now, inftead of fuppofing the fly to drive the beam, let the beam drive the fly. The motions muft be perfectly the fame, and the afcent or defcent of the piften will: produce one revolution of the fly.

A fide view of this apparatus is given in fig 12. marked by the fame letters of reference. This fhows the fituation of parts which were fore-fhortened in fig. 1I. particularly the defcending branch C of the fteam pipe, and the fituation and communications of the two pumps K and I. 8,8 is the horizontal part of the fteam pipe. 9 is a part of it whofe box is reprefented by the dark circle of fig. I1. \(D\) is the box of the fteam clack, and the little circle at its corner reprefents the end of the asis which turns it, as will be defcribed afterwards. N is the place of the upper eduction valve. A part only of the upper eduction-pipe \(G\) is reprefented, the reft being cut off, becaufe it would have covered. the defcending fteam pipe CC. When continued down, it comes between the eye and the box \(E\) of the: lower fteam valve, and the box F of the lower eduction valve.

Let us now trace the operation of this machine: through all its fteps. Recurring to fig. II. let us fup. pofe that the lower part of the cylinder BB is exhaufted of all clattic fluids; that the upper fteam valve \(D\) and the lower eduction valve F are open, and that the lower fteam valve E and upper eduction valve N are fhut. It is. evident that the pifton muft be preffed toward the bottomof the cylinder, and muft pull down the end of the working beam by means of the toothed rack OO and fector QQ , cauling the other end of the beam to urge forward the machinery with which it is connected. When the pifton arrives at the bottom of the cylinder, the valves \(D\) and \(F\) are fhut by the plug frame, and \(E\) and N are opened. By this laft paffage the fteam gets into the eduction-pipe, where it meets with the injection water, and is rapidly condenfed. The fteam from the boiler enters at the fame time by E , and preffing on the lower fide of the pifton, forces it upwards, and by means of the toothed rack \(O O\) and toothed fector \(Q Q\) forces up that end of the working beam, and caufes the other end to urge forward the machinery with which it is connected : and in this manner the operation of the engine may be continued for ever.

The injection water is continually running. into the eduction-pipe, becaufe condenfation is continually going on, and therefore there is a continual atmofpheric preffure to produce a jet. The air which is difengared from the water, or enters by leaks, is evacuated only during the rife of the pifton of the air-pump K. When this is very copious, it renders a very large air-pumpneceffary; and in fome fituations Mr Watt has been. obliged to employ two air-pumps, one worked by each arm of the beam. This in every cafe expends a veryconfiderable portion of the power, for the air-pump is always working againt the whole preffure of the atnoofphere.

It is evident that this form of the engine, by main* taining an almoft conftant and uninterrupted impulafion, is much fitter for driving any machinery of conti-nued motion than any of the former engines, which. were inactive during half of their motion. It does not \({ }_{9}\) however, feem to have this fuperiority when employed to draw water: But it is equally fitted for this tafl. Let the engine be loaded with twice as much as wrould: be proper for it if a fingle Atroke engine, and let a fl y be connected with it. Then it is plain that the power of the engine during the rife of the ftean piton will be accumulated in the fly; and this, in conjunction with the power of the engine during the defcent of the fteam: pifton, will be equal to the whole load of water.

In fpeaking of the fteam and eduction valves, we faid that they were all puppet valves. Mr Watt employed: cocks, and alfo fliding valves, fuch as the regulator or: fteam-valve, he old engines. But he found them. always lofe their tightnefs after a fhort time. This is. not furprifing, when we confider that they are always. perfectly dry, and almoft burning hot. He was therefore: obliged to change them all for puppet clacks, which, when truly ground and nicely fitted in their motions. at firft, are not found to go out of order by any length: of time. Other engineers now univerfally ufe them in: the old form of the feam-engine, without the fame. reafons, and merely by. fervile and ignorant imitation.

The way in which. Mr Watt opens and Thuts thefe: valves is as follows. Fig. 13. reprefents a clack with

\section*{S T E [ 768 ] S T E}
steam.
Jingine.
its feat and box. Suppofe it one of the eduction valves. HE is part of the pipe which introduces the fteam, and GG is the npper part of the pipe which communicates with the condenfer. At EE may be obferved a piece more faintly Gladed than the furrounding parts. This is the feat of the valve, and is a brals or bell-metal ring turned conical on the outfide, fo as to fit exactly into a conical part of the pipe GG. Thefe two pieces are fitted by grinding; and the cone being of a long taper, the ring flicks firmly in it, efpecially after having been there for fome time and united by ruft. The clack itfelf is a ftrong brafs plate D , turned conical on the edge, fo as to fit the conical or floping inner edge of the feat. Thefe are very nicely ground on each other with emery. This conical joining is much more obtufe than the outer fide of the ring; fo that although the joint is airttight, the two pieces do not ftick ftrongly together. The clack has a round tail DG, which is freely moveable up and down in the hole of a crofs piece FF. On the upper fide of the valve is a ftrong piece of metal DC firmly joined to it, one fide of which is formed into a toothed rack. A is the fection of an iron axle which turns in holes in the oppofite fides of the valve-hox, where it is nicely fitted by grinding, fo as to be air-tight. Collets of thick leather, well foaked in melted tallow and rofin, are fcrewed on the outfide of thefe holes to prevent all ingrefs of air. One end of this axis projects a good way without the box, and carries a Spanner or handle; which is moved by the plug-frame. \({ }^{\text {To }}\) this axis is fixed a ftrong piece of metal B , the edge of which is formed into an arch of a circle having the axis \(A\) in its centre, and is cut into teeth, which work in the teeth of the rack DC : K is a cover which is fixed by fcrews to the top of the box HJJH, and may be taken off in order to get at the valve when it needs repairs.

From this defcription it is eafy to fec that by turning the handle which is on the axis \(A\), the fector \(B\) muft lift up- the valve by means of its toothed rack DC, till the upper end of the rack touch the knob or button K. Turning the handle in the oppofite direction brings the valve down again to its feat.

This valve is extremely tight. But in order to open it for the paffage of the fteam, we muft exert a force equal to the preffure of the atmofphere. This in a large engine is a very great weight. A valve of fix inches diameter fuftains a preffure not lefs than 400 pounds. But this force is quite momentary, and hardly impedes the motion of the engine ; for the inftant the valve is detached from its feat, although it has not moved the looth part of ran inch, the preffure is over. Even this little inconvenicace has been removed by a delicate thought of Mr Watt. He has put the fpanner in fuch a pofition when it begins to raife the valve, that its mechanical energy is almoft infinitely great. Let \(Q R\) (fig. 14.) be part of the plug.frame defcending, and \(P\) : one of its pins juft going to lay hold of the fpanner NO moveable round the axis N . On the fame axis is another arm NM connected by a.joint with the leader ML, which is connected alfo by a joint with the fpanner LA that is on the axis \(A\) of the fector within the valve-box. Therefore when the pin \(P\) pufhes down the fpanner NO, the arm N M moves fidewife and pulls down the fpanner A L by means of the connecting rod. Things are fo difpofed, that when the cock is fhut, LM
and \(M \mathrm{~N}\) are in one ftraight line. The intelligent mes chanic will perceive that, in this pofition, the force of the lever O N M is infuperable. It has this further advantage, that if any thing fhonld tend to force open the valve, it would be ineffectual ; for no force exerted at A, and tranfmitted by the rod \(L_{1} M\), can poffibly puifs the joint M ont of its polition. Of fuch importance is it to practical mechanics, that its profeffors fhould beperfons of penctration as well as knowledge. Yet this circumftance is unheeded by hundreds who have fervilely copied from Mr Watt, as may be feen in every engine that is puffed on the public as a difcovery and an improvement. When thefe puppet valves have been introduced into the common engine, we have not feen one inftance where this has been attended to ; certainly becaufe its utility has not been obferved : and there is one fituation where it is of more confequence than in Mr Watt's engiae, viz. in the injection-cock. Here the valve is drawn back into a box, where the water is fo aukwardly difpofed round it that it can hardly get out of its way, and where the preffure even exceeds that of the atınofphere. Indeed this particular fubftitution of the button-valve for the cock is moft injudicious.

We poftponed any account of the ofince of the fly XX (fig. I r.), as it is not of ufe in an engine regulated by the fly V V. The fly XX is only for regulating the reciprocating motion of the beam when the fteam is not admitted during the whole defcent of the pifton. This it evidently mult render more uniform, accumulating a momentum equal to the whole preffure of the full fupply of fteam, and then fharing it with the beam: during the reft of the defcent of the pifton.

When a perfon properly fkilled in mechanics and Review chemiftry reviews thefe different forms of Mr Watt's, Mr Wat fteam-engine, he will eafily perceive them fufceptible of \({ }^{\text {thrce }} \mathrm{gre}\) e many intermediate forms, in which any one or more of ments. the diftinguifhing improvements may be employed. The firt great improvement was the condenfation in a fepa. rate veffel. .This increafed the original powers of the engine, giving to the atmofpheric preffure and to the counter weight their full energy; at the fame time the watte of team is greatly diminifhed. The next improvement by employing the prefiure of the feam inftead of that of the atmofphere, aimed only at a flill farther diminution of the walte; but was fertile in advantages; rendéring the machine more manageable, and particularly enabling us at all times, and without tron-* ble, to fuit the power of the engine to its load of work, however variablc and increafing ; and brought into view a very interefting propofition in the mechanical theory: of the engine, viz. that the whole performance of a: given quantity of fteam may be augmented by admitting it into the cylinder only during a part of the pifton's motion. Mr Watt has varied the application of this propofition in a thoufand ways ; and there is nothing about the machine which gives more employment to the fagacity and judgment of the engineer. The third improvement of the double impulfe may be confidered as the finifhing touch given to the engine, and renders it as uniform in its action as any water-wheel. In the engine in its moft perfect form there does not feem to be above one-fourth of the feam wafted by warming the apparatus; fo that it is not po/foble to make it one-fourth part more powerful than it is at prefent. The only: thing that feems fufceptible of confiderable improvement

\section*{S T E}
is the great beam. The enormous frrains exerted on its arms require a proportional ftrength. This requires a vaft mafs of matter, not lefs indeed in an engine with a. cylinder of 54 inches than three tons and a half, moving with the velocity of three feet in a fecond, which mult be communicated in about half a fecond. This mafs mutt be brought into motion frem a fate of refl, muft again be brought to reft, again into motion, and again to reft, to complete the period of a froke. This confumes much power; and Mr Watt has not been able to load an engine with more than 10 or 1 p pounds on the inch and preferve a fufficient quantity of motion, fo as to make 12 or 15 fix-feet ftrokes in a fecond. Many attempts have been made to leffien this mafs by uling a light framed wheel, or a light frame of carpentry, in place-of a folid beam. 'Thefe have generally been conftructed by perfons ignorant of the true fcientific principles of carpentry, and have fared accordingly. Mr Watt has made fimilar attempts; but found, that although at firft they were abundantly ftrong, yer after a fhort time's employment the flraps and bolts with which the wooden parts were connected cut their way into the wood, and the framing grew loofe in the joints, and, without giving any warning, went to pieces in an inftant. A folid maffy fimple beam, of fufficient ftrength, bends, and fenfibly complains (as the carpenters exprefs it), before it breaks. In all great engines, therefore, fuch only are employed, and in fmaller engines he fometimes ufes caft.iron wheels or pulleys; nay, he frequently ufes no beam or equivalent whatever, but employs the fteam pitton-rod to drive the machinery to which the engine is applied.
We prefume that our thinking readers will not be dipleafed with this rational hiftory of the progrefs of this engine in the hands of its ingenious'and worthy inventor. We owe it to the communications of a friend, well acquainted with him, and able to judge of his merits. The public fee him always aflociated with the no lefs celebrated mechanic and philofopher Mr Boulton of Soho near Birmingham (fee Soro). They have fhared the royal patent from the beginning; and the alliance is equally honourable to both.
The advantages derived from the patent-right fhow both the fuperiority of the engine and the liberal minds of the proprietors. They erect the engines at the expence of the employers, or give working drafts of all the parts, with inffructions, by which any refident engineer may execute the work. The employers felect the beft engine of the ordinary kind in the kingdom, compare the quantities of fuel expended by each, and pay to Meffrs Watt and Boulton one-third of the annual favings for a certain term of years. By this the patentees are excited to do their utmoft to make the engine perfect; and the employer pays in proportion to the advantage he derives from it.
It may not be here improper to ftate the actual performance of fore of thefe engines, as they have been afcertained by experiment.

An engine having a cylinder of \(3^{1}\) inches in diameter, and making 17 double frokes per minute, performs the work of forty horles working night and day (for which three relays or 120 horfes mult be kept), and burns 11,000 pounds of Staffordhire coal per day. A cylinder of 19 inches, making 25 frokes of 4 feet each per minute, performs the work of 12 horfes working Vol. XVII. Part II.
confantly, and burns 3700 pounds of coals per day. A cylinder of 24 inches, making 22 frokes of 5 feet, burns 5500 pounds of coals, and is equivalent to the conftant work of 20 horfes. And the patentees think themfclves authorized by experience to fay in general, that thefe engines will raife more than 20,000 cubic feet of water 24 feet high for every hundred weight of good pit-coal confumed by them.

In confequence of the great fuperiority of Mr Watt's engines, both with refpect to economy and manageablenefs, they have become of moft extenfive ufe ; and in every demand of manufacture on a -great fcale they offer us an indefatigable fervant, whofe ftrength has no bounds. 'The greateft mechanical project that ever en- Propofed gaged the attention of man was on the point of being to drain the executed by this machine. The States of Hollan? were Haerlem treating with Meffrs Watt and Boulton for draining the Meer by Haerlem Meer, and even reducing the Zuyder Zee: engine. and we doubt not but that it will be accomplifhed whenever that unhappy nation has fufficiently felt the difference between liberty and democratic tyranny. Indeed fuch unlimited powers are afforded by this engine, that the engineer now thinks that no talk can be propofed to him which he cannot execute with profit to his employer.

No wonder then that all clafles of engineers have The atturned much of their attention to this engine; and fee- temp \({ }^{\text {ts }}\) to ing that it has done fo much, that they try to make it Mr Watt's do ftill more. Numberlefs attempts have been made to ergine in improve Mr Watt's engine ; and it would occupy a vo- general of lume to give an account of them, whilft that account intie adwould do no more than indulge curiofity. Our engiv vantage: neers by profeflion are in general miferably deficient in that accurate knowledge of mechanics and of chemiftry: which is neceffary for underfanding this machine; and we have not heard of one in this kingdom who can be put on a par with the prefent patentees in this refpect. Moft of the attempts of engineers have been made with the humbler view of availing themfelves of Mr Watt's difcoveries, fo as to conftruct a fteam-engine fuperior to Newcomen's, and yet of a form fufficiently different from Watt's to keep it without the reacl of his patent. This they have in general accomplifhed by performing the condenfation in a place which, with a little ftretch of fancy, not unfrequent in a court of law, may be called part of the cylinder.

The fuccefs of moft of thefe attempts has interfered fo little with the intereft of the patentees, that they the law would have deemed encroachments. We think the otherit our duty to give our opinion on this fubject without referve. Thefe are moft expenfive undertakings, and few employers are atle to judge accurately of the merits of a project prefented to them by an ingenious artif. They may fee the practicability of the fcheme, by having a general notion of the expanfion and condenfation of fteam, and they may be mifled by the ingennity apparent in the conftruction. The engineer himfelf is frequently the dupe of his own ingrenuity; and it is not always difhonelty, but frequently ignorance, which makes him prefer his own invention or (as he thinks it) inprovement. It is a moft delicatc engine, and requires much knowledge to fee what does and what does not improve its performance. We have gone into the preceding minute inveftigation of Mr Watt's progrefs with the exprefs purpofe of making our readers fully mafters 5 E

SteamEngine.

80 Exception in farour of Mr Hornblow er.

Plate ccecexx. \(8!\) Defcription of his fteamzengine.
of its principles, and have more than once pointed out the real improverments, that they may be firmly fixed and always ready in the mind. By having recourfe to them, the reader may pronounce with confidence on the merits of any new conftruction, and will not be deceived by the puffs of an ignorant or difhoreft engineer.

We mult except from this general criticifm a conftruction by Mr Jonathan Hornblower near Briftol, on account of its fingularity, and the inģenuity and real fkill which appears in fome particular's of its conftruction. The following fhort defcription will fufficiently explain its principle, and enable our readers to appreciate its merit.

A and B (fig. I 5.) reprefent two cylinders, of which A is the largeff. A piton moves in each, havine their rods \(C\) and \(D\) moving through collars at \(E\) and \(F\). Thefe cylinders may be fupplied with fteam from the boiler by means of the fquare pipe \(G\), which has a flanch to connect it with the reft of the fteam pipe. This fquare part is reprefented as branching off to both cylinders. \(c\) and \(d\) are two cocks, which have handles and tumblers as ufual, worked by the plug-beam W. On the fore-fide (that is, the fide next the eye) of the cylinders is reprefented another communicating pipe, whofe fection is alfo fquare or rectangular, having alfo two cocks \(a, b\). The pipe Y, immediately under the cock \(b\), eftablifhes a conimunication between the upper and lower parts of the fmall cylinder \(B\), by opening the cock \(b\). There is a fimilar pipe on the other fide of the cylinder \(A\), immediately under the cock \(d\). When the cocks \(c\) and \(a\) are open, and the cocks \(b\) and \(d\) are fhut, the fteam from the boiler has free admiffion into the upper part of the cylinder 13 , and the fteam from the lower part of \(B\) has free admiffion into the upper part of A; but the upper part of each cylinder has no communication with its lower part.

From the bottom of the great cylinder proceeds the eduction-pipe K, having a valve at its opening into the cylinder, which bends downwards, and is conneeted with the conical condenfer \(L\) (c). The condenfer is fixed on a hollow box M , on which fand the pumps N and O for extracting the air and water; which laft runs along the trough \(T\) into a ciftern U , from which it is raifed by the pump \(V\) for recruiting the boiler, being already nearly boiling hot. Immediately under the condenfer there is a fpigot valve at \({ }^{\circ} \mathrm{S}\), over which is a fmall jet pipe, reaching to the bend of the eduction. pipe. The whole of the condenfing apparatus is contained in a ciftern \(R\) of cold water. A fmall pipe \(P\) comes from the fide of the condenfer, and terminate's on the bottom of the trough \(T\), and is there covered with a valve \(Q\), which is kept tight by the water that is always running over it. Laftly, the pump-rods X caufe the outer end of the beam to preponderate, fo that the quiefcent pofition of the beam is that reprefented in the figure, the pitons being at the top of the cylinders. - Suppofe all the cocks open, and fteam coming in copioufly from the boiler, and no condenfation going on in \(L\); the fteam muft drive out all the air, and at laft follow it through the valve \(Q\). Now fhut the valves \(b\) and \(d\), and open the valve \(S\) of the condenfer. The
condeniation will immediately commence. There is now no preffure on the under fide of the pifton of \(A\), and it immediately defcends. The communication between the lower part of \(B\) and the upper part of \(A\) being open, the fteam will go from \(B\) iuto the fpace left by the pifton of \(A\). It mult therefore expand, and its elafticity muft diminifh, and will no longer balance the preffure of the fteam above the pifton of B . This pifton thercfore, if not with.held by the beam, would defcend till it is in equilibrio, having fteam of equal denfity above and below it. But it cannot defcend fo far ; for the cylinder \(A\) is wider than \(B\), and the arm of the beam at which its pifton hangs is longer than the arm which fuppo:ts the pitton of \(B\) : therefore when the pifton of \(B\) has defcended as far as the beam will permit it, the fteam between the tivo piftons occupies a larger fpace than it did when both piftons were at the tops of their cylinders. Its denfity, therefore, and its elafticity, diminifh as its bulk increafes. It is therefore not a balance; for the fteam on the upper fide of \(B\), and the pifton \(B\), pulls at the beam with all the difference of thefe preflures. The fighteft view of the fubject muft fhow the reader, that as the piftons defcend, the fteam that is between them will grow continually rarer and lefs elaftic, and that both piftons will pull the beam downwards.

Suppofe now that each lias reached the bottom of its cylinder. Shut the cock \(a\) and the eduction cock at the bottom of A, and open the cocks \(b\) and \(d\). The communication being now eftablifhed between the upper and lower part of each cylinder, nothing hinders the counter weight from raifing the piftons to the top. Let them arrive there. The cylinder B is at this time filled with fteam of the ordinary denfity, and the cylinder \(A\) vith an equal abfolute quantity of fteam, but expanded into a larger fpace.
Shut the cocks \(b\) and \(d\), and open the cock \(a\), and the eduction cock at the bottom of A ; the condenfation will again operate, and the piftons defcend. And thus the operation may be repeated as long as fteam is, fupplied; and one full of the cylinder B of ordinary fteam is expended during each working ftroke.

Let us now examine the power of this engine. It is evident, that when both piftous are at the top of their refpective cylinders, the active preffure (that is, the dif. ference of the preffure on its two fides) on the pilton of \(B\) is nothing, while that on the pifton of \(A\) is equal: to the full preffure of the atmofphere on its area. This, multiplied by the length of the arm by which it is fupported, gives its mechanical energy. As the piftons defcend, the preffure on the pifton of \(B\) increafes, whilethat on the pifton of A diminifhes. When both are at the bottom, the preffure on the pifton of \(B\) is at its. maximum, and that on the pifton of \(A\) at its miniz
mum. mum.
Mr Hornblower faw that this muft be a beneficial employment of fteam, and preferable to the practice of condenfing it while its full elafticity remained; but he has not confidered it with the attention neceffary for af. certaining the advantage with precifion,

Let \(a\) and \(b\) reprefent the areas of the pitons of \(A\)
(c) This, however, was flopped by Watt's patent; and the condenfation muft be performed as in Newcomen's
engine, or at leaft in the cylinder A.

\section*{S T E \(\quad\left[\begin{array}{ll}771\end{array}\right] \quad\) S T E} which they are fupported. It is evident, that when both piftons have arrived at the bottoms of their cylinders, the capacities of the cylinders are as \(a \alpha\) and \(b \beta\). Let this be the ratio of \(m\) to I . Let \(g h i k\) (fig. I6.) and \(l m n \circ\) be two cylinders of equal length, communicating with each other, and fitted with a pifton-rod \(p q\), on which are fixed two piftons \(a a\) and \(b b\), whofe areas are as \(m\) and I . Let the diftance between the piftons be precifely equal to the height of each cylinder, which height we fhall call \(b\). Let \(x\) be the face \(g b\) or \(b a\), through which the piftons have defcended. Let the upper cylinder communicate with the boiler, and the lower cylinder with the condenfer or vacuum V.

Any perfon in the leaft converfant in mechanics and pneumatics will clearly fee that the ftrain or preffure on the pifton rod \(p q\) is precifely the fame with the united energies of the two pifton rods of Mr Hornblower's engine, by which they tend to turn the working beam round its axis.

The bafe of the upper cylinder being 1 , and its height \(b\), its capacity or bulk is \(\mathrm{I} h\) or \(h\); and this expreffes the natural bulk of the fteam which formerly filled it, and is now expanded into the feace bblaamib. The part \(b b i b\) is plainly \(=b-x\), and the part laam is \(=m x\). The whole fpace therefore is \(m x+b-x\), \(=b+m x-x\), or \(b+\overline{m-1} x\). Therefore the de \(\mathrm{n}_{\mathrm{n}}\). fity of the fleam between the piftons is \(\frac{b}{b+\overline{m-1} x}\).

Let \(p\) be the downward preffure of the fteam from the boiler on the upper pifton \(b b\). This pifton is alfo preffed up with a force \(=p \frac{b}{b+\frac{1}{m-1} x}\) by the fteam between the piftons. It is therefore, on the whole, preffed downward with a force \(=p\left(1-\frac{b}{b+m-1 x}\right)\). The lower pifton \(a\), having a vacuum below it, is preffed downwards with a force \(=p \frac{m b}{b+\overline{m-1} x}\). Therefore the whole preffure on the pifton rod downwards is \(=p\left(1+\frac{m b}{b+m-1 x}-\frac{b}{b+m-1 x}\right),=p(1+\) \(\left.\frac{\overline{m-1} b}{b+\overline{m-1} x}\right),=p+\frac{p b \overline{m-1}}{b+\overline{m-1} x}=p+\frac{p b}{\frac{b}{m-1}+x}\).

This then is the momentary preffure on the pifton rod correfponding to its defcent \(x\) from its higheft pofition. When the piftons are in their higheft pofition, this preffure is equal to \(m p\). When they are in their loweft pofition, it is \(=p \frac{2 m-1}{m}\). Here therefore is an acceffion of power. In the beginning the preffure is greater than on a fingle pifton in the proportion of \(m\) to \(i\); and at the end of the ftroke, where the preffure is weakeft, it is ftill much greater than the preffure on a fugle pifton. Thus, if \(m\) be 4 , the preffure at the beginning of the Atroke is \(4 p\), and at the end it is \(\frac{7}{4} p\), almoft double, and in all intermediate pofitions it is greater. It is worth while to obtain the fum total of all the
accumulated preflures, that we may compare it with the conftant preffure on a fingle pifton.

We may do this by confidering the momentary preffure \(p+\frac{p b}{\frac{b}{m-1}+x}\), as equal to the ordinate \(G F\), \(\mathrm{H} b\), or \(\mathrm{M} c\), of a curve \(\mathrm{F} b c\) (fig. ro.), which has for its axis the line GM equal to \(b\) the height of our cylinder. Call this ordinate \(y\). We have \(y=p+\) \(\frac{p b}{\frac{b}{m-1} x}\), and \(y-p=\frac{p b}{\frac{b}{m-1}+\infty}\). Now it is plain that \(\frac{p b}{b-1}+x\) is the ordinate of an equilateral hyperbola, \({ }_{3}\) of which \(p b\) is the power or rectangle of the ordinate and abfcifs, and of which the abfcifs reckoned from the centre is \(\frac{b}{m-1}+x\). Therefore make \(\mathrm{GE}=p\), and draw DEA parallel to MG , and make \(\mathrm{EA}=\frac{\mathrm{GM}}{m-1}\) \(=\frac{b}{m-1}\). The curve \(\mathrm{F} b c\) is an equilateral hyperbola, having \(A\) for its centre and \(A D\) for its affymptote. Draw the other affymptote AB , and its ordinate FB . Since the power of the hyperbola is \(=p h,=\) GEDM (for \(\mathrm{GE}=p\), and \(\mathrm{GM}=b\) ) ; and fince all the inferibed rectangles, fuch as AEFB , are equal to \(p h\), it follows that AEFB is equal to GEDM, and that the area \(\mathrm{ABF} c \mathrm{DA}\) is equal to the area \(\mathrm{GF} c \mathrm{MG}\), which exprefles the accumulated preffure in Hornblower's engine.

We can now compute the accumulated preffure very eafily. It is evidently \(=p b \times\left(I+L \cdot \frac{A D}{A E}\right)\).

The intelligent reader cannot but obferve that this is precifely the fame with the accumulated preffure of The accuquantity of fteam admitted in the beginning, and ftop-preflure ped in Mr Watt's methe fame ped in Mr Watt's method, when the piton has defcen- with that ded through the \(m\) th part of the cylinder. In con- of Mr fidering Mr Hornblower's engine, the thing was pre-Watt's enfented in fo different a form that we did not perceivegine. the analogy at firt, and we were furprifed at the refult. We could not help even regretting it, becaufe it had the appearance of a new principle and an improvement: and we doubt not but that it appeared fo to the ingenious author; for we have had fuch proofs of his liberality of mind as permit us not to fuppofe that he faw it from the beginning, and availed himfelf of the difficulty of tracing the analogy. And as the thing may miflead others in the fame way, we have done a fervice to the public by fhowing that this engine, fo coftly and fo difficult in its conftruction, is no way fuperior in power to Mr Watt's fimple method of fop. ping the fteam. It is even inferior, becaule there mult be a condenfation in the communicating paffages. We may add, that if the condenfation is performed in the cylinder \(A\), which it mult be unlefs with the permifo fion of Watt and Boulten, the engine cannot be much fuperior to a common engine; for much of the fteam from below B will be condenfed between the piftons by the coldnefs of the cylinder \(A\); and this diminifhes the

\section*{S T E}

StcomEngine.

83 S-ill, however, the engine dif covers in. genuity and fkill.
downward preffure on A more than it increafes the downward preffure on B. We learn however that, by confining the condenfation to a fmall part of the cylinder A, Mr Hornblower has erecied engines clear of \(-\mathrm{M}_{\mathrm{r}}\). Watt's patent, which are confiderably fuperior to Newcomen's: fo has Mr Symington.

We faid that there was nuch ingenuity and real fixill obrervable in many particulas of this encrine. The difpofition and connection of the cylinders, and the whole condenfing apparatus, are contrived with peculiar neatnefs. The cocks are very ingenious: they are compofed of two flat circular plates ground very true to each other, and one of them turns round on a pini through their centres; each is pierced with three lectoral apertures, exactly correfponding with each other, and occupying a little lefs than one half of their furfaces. By turning the moveable plate fo that the apertures coincide, a large paffage is opened for the fteam-; and by turning it fo that the folid of the one covers the aperture of the other, the cock is fhut. Such regulators are now very common in the caft iron ftoves for warming rooms.

Mr Hornblower's contrivance for making the collars for the pifton rods air-tight is alfo uncommonly ingemious. This collar is in fact two, at a fmall difance from each other. A fmall pipe, branching off from the main fteam pipe, communicates with the fpace between the collars. This fteam, being a little fronger than the preffure of the atmofphere, effectually hinders the air from penetrating by the upper collar; and though a little fteam fhould get through the lower collar into the cylinder \(A\), it can do no harm. We fee many cafes in which this pretty contrivance may be of fignal fervice.

But it is in the framing of the great working beam that Mr Hornblower's fcientific knowledge is mot confpicuous: ; and we have no hefitation in affirming that it is Atronger than a beam of the common form, and con. taining twenty times its quantity of timber. There is hardly. a part of it expofed to a tranfverfe ftram, if we except the ftrain of the pump. \(V\) on the ftrutt by which it is worked. Every piece is either pufhed or pulled in the direction of its length. We only fear that the bolts which connect the upper beam with the two iron bars under its ends will work loofe in their holes, and tear out the wood which lies between them. We would propofe to fubftitute an iron bar for the whole of this upper beam. This working beam highly deferves the attention of all carpenters and engineers. We have that opinion of Mr Hornblower's knowledge and talents, that we are confident that he will fee the faimefs of our examination of his engine, and we truft to his candour for an excufe for our criticiin.

The reciprocating motion of the fleam-engine has always been confidered as a great defect; for though it be now obviated by connecting it with a fly, yet, unlefs it is an engine of double ftroke, this fly muit be an enormous mafs of matter. moving with great velocity. Any accident happening to it would produce dreadful effects: A part of the rim detaching itfelf would have the force of a bomb, and no brilding could withftand it. Many attempts have been made to produce a circular motion at once by the fteam. It has been made to blow, on the vanes of a wheel of various forms. But the rarity of feam is fuch, that even if none is condenfed
by the cold of the vanes, the impulfe is exceedingly feeble, and the expence of fleam, to as to produce any ferviccable impulfe, is enormous. Mr Watt, among his firt fpeculations on the fteam-engine, made fome attempts of this kind. One in particular was uncommonly ingenious. It confifted of a drum turning airtight within another, with cavities fo difpofed that there was a conftant and great preffure urging it in one direc tion. But no packing of the commo kind could pre circular ferve it air-tight with fufficient mobility. He fucceed-fteam u ed by immerfing it in mercury, or in an analgam which fucceffif remained fluid in the heat of boiling water; but the continual trituration foon calcined the fluid and rendered it ufelefs. He then tried Parent's or Dr Barker's mill, inclofing the arms in a metal drum, which was immerfed in cold water. The fteam ruffed rapidly along the pipe which was the axis, and it was hoped that a great reaction would have been exerted at the ends of the arms ; but it was almoft nothing. The reafon feems to be, that the greatelt part of the fteam was condenfed in the cold arms. It was then tried in a drum kept boiling-hot; but the impulfe was now very fmall in comparifon with the expence of fteam. This muft be the cafe.
Mr Watt has defcribed in his fpecification to the patent office fome contrivances for producing a circular motion by the immediate action of the fleam. Some of thefe produce alternate motions, and are perfectly analogous to his double Atroke engine. Others produce a continued motion. But he has not given fuch a defeription of his valves for this purpofe as can enable an engineer to conftruct one of them. Fiom any guefs that we can form, we think the machine very imperfect; and we do net find that Mr Watt has ever erected a continuous circular engine. He has doubtlefs found still the 87 all his attempts inferior to the reciprocating engine with cafe in no a fly. A very crude fcheme of this kind may be feen def ferare in the Tranfactions of the Royal Society of Dublin reit prin 1787. But although our attempts have hithertociples ma failed, we hope that the cafe is not yet defperate: be emple We fee different principles which have not yet beenem- \({ }^{\text {ed }}\) ployed.

We fhall conclude our account of this noble engine Mr Wat \({ }^{88}\) with obferving, that Mr Watt's form fuggefts the con-engive fu ftruction of an excellent air-pump. A large veffelgefts the may be made to communicate with a boiler at one fide, conftrucand with the pump-receiver on the other, and alfo with excellent a condenfer. Suppofe this veffel of ten times the ca-air-pumy pacity of the receiver : fill it with fteam from the boiler, and drive out the air from it ; then open its communication with the receiver and the condenfer. This will rarefy the air of the receiver 10 times. Repeating the operation will rarefy it 100 times; the third operation will rarefy it 1000 times; the tourth 10,000 times, \&c. All this may be done in half a minute.

Sream-Kitchen. Ever fince Dr Papin contrived his digefter (about the year 1690), fchemes have been propofed for dreffing victuals by the fteam of boiling water. A philofophical club ufed to dine at Saltero's coffeehoufe, Chelfea, about 30 years ago, and had their victuals dreffed by hanging them in the boiler of the fteam-engine which raifes water for the fupply of \(\mathrm{P}_{\mathrm{i}}\) cadilly and its neiglhbourhood. They were completely drefled, and both expeditioully and with high flaovour.

\section*{S T E [ 773 ] S T E}

A patent was lately obtained for an apparatus for this purpofe by a tin-man in London; we think of the name of Tate. They are made on a much more effective plan by Gregory, an ingenious tradefman in Edinburgh, and are coming into very general ufe.

It is well known to the philofopher that the feam of boiling water contains a prodigious quantity of heat, which it retains in a latent ftate ready to be faithfully accounted for, and communicated to any colder body. Every cook knows the great fcalding power of fteam, and is difpofed to think that it is much hotter than boiling water. This, however, is a miftake; for it swill raife the thermometer no higher than the water from which it comes. But we can affure the cook, that it he make the fteam from the fpout of a tea-kettle pafs through a great body of cold water, it will be condenfed or changed into water; and when one pound of water has in this manner been boiled off, it will have heated the mafs of cold water as much as if we had thrown into it feven or eight hundred pounds of boiling hot water.

If, therefore, a boiler be properly fitted up in a furnace, and if the fteam of the water boiling in it be conveyed by a pipe into a pan containing victuals to be dreffed, every thing can be cooked that requires no higher degree of heat than that of boiling water : And this will be done without any rifk of fcorching, or any kind of overheating, which frequently fpoils our difhes, and proceeds from the burning heat of air coming to thofe parts of the pot or pan which is not filled with liquor, and is covered only with a filr, which quickly burns and taints the whole dih. "Nor will the cook be fcorched by the great heat of the open fire that is neceffary for dreffing at once a number of difhes, nor have his perfon and clothes foiled by the fmoke and foot unavoidable in the cooking on an open fire. Indeed the whole procefs is fo neat, fo manageable, fo open to infpection, and fo cleanly, that it need neither fati, rue nor offend the delicacy of the niceft lady.

We had great doubts, when we firt heard of this as a seneral mode of cookery, as to its economy; we had none as to its efficacy. We thought that the ftcam, and confequently the fuel expended, muft be vaflly greater than by the immediate ufe of an open fire; but we have feen a large tavern dinner expeditioufly dreffed in this manner, feemingly with much lefs fuel than in the common method. 'The following finple narration of facts will how the fuperiority. In a paper manufacture in this neighbourhood, the vats containing the pulp. into which the frames are dipped are about fix feet diameter, and contain above 200 gallons. This is brought to a proper lieat by means of a fmall cockle or furnace in the middle of the liquor. This is heated by putting in abont one hundred.weight of coals about eight o'clock in the evening, and continuing this till four next morning, renewing che fuel as it burns away. This method was lately changed for a fleam heater. A furnace, having a boiler of five or fix feet diameter and three feet deep, is heated about one o'clock in the morning with two hundred weight of coals, and the water kept in brifk ebnllition. Pipes go off from this boiler to fix vats, fome of which are at 90 feet diftance. It is conveyed into a flat box or veffel in the midft of the pulp where it condenfes, imparting its heat to the fides of the box, and thus heats the furrounding pulp. Thefe fix vats are as completely heated in three
hours, expending ahout three hundred weight of coals, as they were formerly in eight hours, expending near 18 hundred weight of coals. Mr Gregory, the inventor of this fleam-heater, has obtained (in company with Mr Scott plumber, Edinburgh) a patent for the invention; and we are perfuaded that it will come into very general ufe for many fimilar purpofes. The dyers, hatmakers, and many other manufacturers, have occafion for large vats kept in a continual heat; and there feems no way fo effectual.

Indeed when we reflect ferioufly on the fubject, we fee that this method has immenfe advantases confidered merely as a mode of applying heat. The fteam may be applied to the veffel containing the victuals in every part of its furface: it may even be made to enter the veffel, and apply itfelf immediately to the piece of meat. that is to be dreffed, and this without any rilk of fcorching or overdoing.-And it will give out about \(\frac{7}{8} 9 \frac{9}{8}\) of the heat which it contains, and will do this only if it be wanted; fo that no heat whatever is walted except what is required for leating the apparatus. Experience fhows that this is a mere trifle in comparifon of what was fuppofed neceffary. But with an open fire we only apply the flame and hot air to the bottom and part of the fides of our boiling veffels: and this application is hurried in the extreme; for to make a great heat, we mult have a great fire, which requires a prodigious and mott rapid current of air. This air touches our pans but for a moment, imparts to them but a fmall portion of its heat ; and, we are perfuaded that three-fourths of the heat is carried up the chimney, and efcapes in pure wafte, while another great: portion beams out into the kitchen to the, great annoyance of the fcorched cook. We think, therefore, that a page or two of this work will not be thrown away in the defcription of a contrivance by which a faving may be made to the entertainer, and the providing the pleafures of his table prove a lefs fatiguing tak to this valuable corps of practical chemits.
Let A reprefent a kitchen-boiler, either properly fitted up in a furnace, with its proper fire place, ath-pit, and flue, or fet on a tripod on the open fire, or built up in the general fire place. The ftean-pipe \(B C\) rifes from the cover of this boiler, and then is led away with a gentle afcent in any convenient direction. C reprefents the fection of this conducting tteam-pipe. Branches are taken off from the fide at proper diltances. Oneof thefe is reprefented at CDE, furnifhed with a cock \(D\), and having a taper nozzle E, fitted by grinding into a conical piece F , which communicates with an upright pipe GH, which is foldered to the fide of the ftewing veffel \(P Q R S\), communicating with it by the thort pipe I. The veffel is fitted with a cover OT, having a ftaple handle \(V\). The piece of meat M is laid on a tin plate grate KL, pierced with holes like a cullender, and ftanding on three fhort feet \(n n n\).

The fteam from the boiler comes in by the pipe \(I\), and is condenfed by the meat and by the fides of the veffel, communicating to them all its heat. What is not fo condenfed efcapes between the veffel and its cover. 'The condenfed water lies on the bottom of the veffel, mixed with a very fmall quantity of gravy and fatty matter from the victuals. Frequently, inftead of a cover, another ftew-veffel with a cullender bottom is. fet on this one, the bottom of the one fitting the mouth
steamKitchen.

\section*{S T E [ 774 ] S T E}

Steam- of the other: and it is obferved, that when this is done, Kurchen. he difh in the under veffel is more expeditioully and better dreffed, and the upper difh is more flowly, but as completely ftewed.
This defcription of one ftewing veffel may ferve to give a notion of the whole; ouly we muft obferve, that when broths, foups, and difhes with made fauces or containing liquids, are to be dreffed, they muft be put into a fmaller veffel, which is fet into the veffel PQRS, and is fupported on three fhort feet, fo that there may be a fpace all round it of about an inch or three quarters of an inch. It is obferved, that difhes of this kind are not fo expeditioufly cooked as on an open fire, but as completely in the end, only requiring to be turned up now and then to mix the ingredients; becaufe as the liquids in the inner veffel can never come into ebrillition, unlefs the fteam from the boiler be made of a dangerous heat, and every thing be clofe confined, there cannot be any of that tumbling motion that we oblerve in a boiling pot.

The performance of this apparatus is far beyond any expectation we had formed of it. In one which we examined, fix pans were ftewing together by means of a boiler \(10 \frac{x}{2}\) inches in diameter, ftanding on a brifk open fire. It boiled very brifkly, and the fleam puffed frequently through the chinks between the ftew-pans and their covers. In one of them was a piece of meat confiderably above 30 pounds weight. This required above four hours ftewing, and was then very thoroughly and equally cooked; the outfide being no more done than the heart, and it was near two pounds heavier than when put in, and greatly fwelled. In the mean time, feveral difhes had been dreffed in the other pans. As far as we could judge, this cooking did not confume one-third part of the fuel which an open fire would have required for the fame effect.

When we confider this apparatus with a little more knewledge of the mode of operation of fire than falls to the fhare of the cooks (we fpeak with deference), and confider the very injudicious manner in which the fleam is applied, we think that it may be improved fo as to furpafs any thing that the cook can have a notion of.

When the fteam enters the ftew-pan, it is conderfed on the meat and on the veffel ; but we do not want it to be condenfed on the veffel. And the furface of the veffel is much greater than that of the meat, and continues much colder; for the meat grows hot, and continues fo, while the veffel, made of metal which is a very perfect conductor of heat, is continually robbed of its heat by the air of the kitchen, and carried off by it. If the meat touch the fide of the pan in any part, no fteam can be applied to that part of the meat, while it is continually imparting heat to the air by the intermedium of the veffel. Nay, the meat can hardly be dreffed unlefs there be a current of fteam through it; and we think this confirmed by what is oblerved above, that when another ftew-pan is fet over the firft, and thus gives occafion to a current of fteamsthrough its cullender bottom to be condenfed by its fides and contents, the lower difh is more expeditioully dreffed. We imagine, therefore, that not lefs than half of the feam is wafted on the fides of the different ftew-pans. Our firft attention is therefore called to this circumftance, and we
wifh to apply the fteam more economically and effece tually.

We would therefore conftruct the ft cam-kitchen in the following manner :

We would make a wooden cheft (which we fhall call the Stew-chest) A BCD. This fhould be made of deal, in very narrow flips, not exceeding an inch, that it may not fhrink. This fhould be lined with very thin copper, lead, or even ftrong tinforl. This will prevent it from becoming a conductor of heat by foaking with fteam. For further fecurity it might be fet in another cheft, with a fpace of an inch or two all round, and this fpace filled with a compofition of powdered charcoal and clay. 'Shis fhould be made by firft making a mixture of fine potter's clay and water about as thick as poor cream : then as much powdered charcoal muft be beat up with this as can be made to ftick together. When this is rammed in and dry, it may be hot enough on one fide to melt glafs, and will not difcolour white paper on the other.

This cheft muft have a cover LMNO, alfo of wood, having holes in it to receive the ftew-pans \(P, Q\), R. Between each pan is a wooden partition, covered on boch fides with milled lead or tinfoil. The whole top mult be covered with very fpungy leather or felt, and made very flat. Each ftew-pan muft have a bearing or fhoulder all round it, by which it is fupported, refting on the felt, and lying fo true and clofe that no fteam can efcape. Some of the pans fhould be fimple, like the pan \(F\), for dreffing broths and other liquid difhes. Others thould be like E and G , having in the bottom a pretty wide hole \(\mathrm{H}, \mathrm{K}\), which has a pipe in its upper fide, ifing about an inch or an inch and half into the ftew-pan. The meat is laid on a cullender plate, as in the common way; only there muft be no holes in the cullender immediately above the pipe.Thefe ftew-pans muft befirted with covers, or they may have others fitted to their mouths, for warming fauces or other difhes, or ftewing greens, and many other fubordinate purpofes for which they may be fitted.

The main-pipe from the boiler muft have branches, (each furnifhed with a cock), which adnit the fteam into thefe divifions. At its firft entry fome will be condenfed on the bottom and fides; but we imagire that thefe will in two minntes be heated fo as to condenfe no more, or almoft nothing. The fteam will alfo quickly condenfe on the ftew-pan, and in half a minute make it boiling hot, fo that it will condenfe no more; all the reft will now apply itfelf to the meat and to the cover. It may perhaps be advifable to allow the cover to condenfe fteam, and \(\epsilon\) ven to wafte it. This may be promoted by laying on it flannel foaked in water: Our view in this is to create a demand for fteam, and thus produce a current through the ftew-pan, which will be applied in its paffage to the victuals. But we are not certain of the neceffity of this. Steam is not like common air of the fame temperature, which would glide along the furfaces of bodies, and impart to them a fmall portion of its heat, and efcape with the reft. To produce this effect there muft be a current; for air hot enough to melt lead, will not boil water, if it be kept ftagnant round the veffel. But fteam imparts the whole of its latent heat to any body colder than boiling water, and goes no farther till this body be made boiling hot.

\section*{S T E}

It is a moft faithful carrier of heat, and will deliver its whole charge to any body that can take it. Therefore, although there were no partitions in the ftew-cheft, and the fteam were admitted at the end next the boiler, if the pan at the farther end be colder than the reft, it will all go thither ; and will, in fort, communicate to every thing impartially according to the demand. If any perfon has not the confidence in the ftean which we exprefs, he may ftill be certain that there muft be a prodigious faving of heat by confining the whole in the ftew cheft ; and he may make the pans with entire botroms, and admit the fteam into them in the common way, by pipes which come through the fides of the cheft and then go into the pan. There will be none loft by condenfation on the fides of the cheft; and the pans will foon be heated up to the boiling temperature; and hardly any of their heat will be wafted, becaufe the air in the cheft will be ftagnant. The chief reafon for recommending our method is the much greater eafe with which the ftew pans can be fhifted and cleaned. There will be little difference in the performance.

Nay, even the common feam-kitchen may be prodigiounly improved by merely wrapping each pan in three or four folds of coarfe dry flannel, or making flannel bags of three or four folds fitted to their fhape, which can be put on or removed in a minute. It will alfo greatly conduce to the good performance to wrap the main team pipe in the fame manner in flannel.

We faid that this main-pipe is conducted from the boiler with a gentle afcent. The intention of this is, that the water produced by the unavoidable condenfation of the fteam may run back into the boiler. But the rapid motion of the fteam generally fweeps it up hill, and it runs into the branch:pipes and defcends into the ftew-pans. Perhaps it would be as well to give the main-pipe a declivity the other way, and allow all the water to collect in a hot well at the farther end, by means of a defcending pipe, having a loaded valve at the end. This may be fo contrived as to be clofe by the fire, where it would be fo warm that it would not check the boiling if again poured into the hoiler. But the utmoft attention muft be paid to cleanlinefs in the whole of this paffage, becaufe this water is boiled again, and its fteam paffes through the heart of every difh. This circumftance forbids us to return into the boiler what is condenfed in the flew-pans. This would mix the taftes and flavours of every difh, and be very difagreeable. All this mult remain in the bottom of each ftew-pan ; for which reafon we put in the pipe rifing up in the middle of the bottom. It might indeed be allowed to fall down into the ftew-cheft, and to be collected in a common receptacle, while the fat would float at top, and the clear gravy be obtained below, perhaps fit for many fauces.

The completeft. method for getting rid of this condenfed fteam would be to have a fmall pipe running along the under fide of the main conductor, and communicating with it at different places, in a manner fimilar to the air difcharger on the mains of water-pipes. In the paper manufacture mentioned above, each fteambox has a pipe in its bottom, with a float-cock, by which the water is difcharged; and the main pipe being of great diameter, and laid with a proper acclivity, the water runs back into the boiler.

But thefe precautions are of little moment in a fteam.
kitchen even for a great table; and for the general ufe of private families, would hurt the apparatus, by making it complex and of nice management. For a fmall family, the whole apparatus may be fet on a table four feet long and two broad, which may be placed on cafters, fo as to be wheeled out of the way when not in ufe. If the main conductor be made of wood, or properly cafed in flannel, it will condenfe fo little fteam that the cooking table may ftand in the remoteft corner of the kitchen without fenfibly impairing its performance; and if the boiler be properly fet up in a fmall futnace, and the flue made fo that the flame may be applied to a great part of its furface, we are perfuaded that three.fourths of the fuel ufed in common cookery will be faved. Its only inconvenience feems to be the indifpenfable neceffity of the moft anxious cleanlinefs in the whole apparatus. The moft trifing neglect in this will deftroy a whole dinner.

We had almoft forgotten to obferse, that the boiler muft be furnifhed with a funnel for fupplying it with water. This fhould pafs through the top, and its pipe reach near to the bottom. It will be proper to have a cock on this funnel. There fhould alfo be another pipe in the top of the boiler, having a valve on the top. If this be loaded with a pound on every fquare inch, and the fire fo reguated that fteam may be oblerved to puff fometimes from this valve, we may: be certain that it is paffing through our difhes with fufficient rapidity; and if we fhut the cock on the funnel. and load the valve a little more, we fhall caufe the fteam to blow at the covers of the flew-pans. If one of thefe be made very tight, and have a hole alfo furnifhed with a loaded valve, this pan becomes a digetter, and will diffolve bones, and do many things which are impracticable in the ordinary cookery.

Si quid novilli reciius ifis, Candidus imperti ; - 12 non, bis utere noflis.
STEATITES or Soaj-earth, a genus of the mag. nefian order of earths. Of this genus there are feveral fpecies, for which fee Mineralogy. According to the analyfis of Bergman, 100 parts of featites contain 80 of filex, 17 of mild magnef \(a_{,}, 2\) of argillaceous earth \({ }_{1}\). and nearly s of iron in a femioxidated ftate.

This fubftance may be formed into a pafte with water, fufficiently ductile to be worked on the potter's wheel; and by expofure to a great heat it is hardened fo as to ftrike fire with fteel. It has alfo the property of FUL ler's Earth in cleanfing cloths from greafe: but it does not diffufe in water fo well as clays do; and when digefted with vitriolic acid, it does not form alum, as clays do, but a falt fimilar to Epfom falt. Fromits foftnefs and ductility it may be eafily formed into pots for the kitchen; and hence it has got the name of lapis ollaris.

STEATOMA, a kind of encyfted tumor, confitting of a matter like fuet or lard, foft, without pain, and without difcolouring the flzin.

STEEL, iron united with carbone. See Iron.
Steel has properties diftinct from thofe of iron, which render it of fuperior value. From its higher degree of harduefs it admits a finer polifh and affumes a brighter colour. When tempered, it poffeffes a higher degree of elafticity, and is alfo more fonorous. It is more weak. ly attracted by the loadtone, it receives more fowly themagnetic power, but it preferves it longer. When ex. pofd to a moift air, it does not contract ruft fo cafily as

Steam.

Cbaptal's Cbemifry, vol. ii. 8. 347.
iron. It is alfo heavier, increafing in weight, according to Chaptal, one hundred and feventieth part. M. Rinman lias given as the refult of feveral accurate experiments on different kinds of fteel the following fpecific gravity 7,795 , while he makes ductile iron 7,700 , and crude iron 7,251 .

All iron is convertible into fteel by expofing it to a certain degree of heat for a certain time alones with a quantity of charcoal. Chemifts differ in opinion concerning the nature and effee:s of this procefs. Some fay that fteel is produced by abforbing a quantity of caloric or heat in a latent ftate, as the older chemits had faid it was formed by abforbing phlogifton. Lavoifier feems to have afcribed the qualities of ftel to a flight degree of oxidation, others to a combination with plumbago or black lead, and others to a union with carbone. In agreeing witl thofe who fay the formation of iteel is owing to carbone, we do not differ effentially from thofe who attribute it to plumbago; for the art of chemiftry has now found that thefe fubftances are very nearly allied. Plumbago is a true charcoal combined with a little iron. The brilliant charcoal of certain vegetable fubfances, more efpecially when formed by diftillation in clofe veffels, poffeffes all the characters of plumbago. The charcoal of animal fubftances poffeffes characters fill more peculiarly refembling it. Like it they are difficult to incinerate, they leave the fame impreffion on the hands and upon paper; they likewife contain iron, and become converted into carbonic acid by combultion. When animal fubftances are diftilled by a ftrong fire, a very fine powder fublimes, which attaches itfelf to the inner part of the neck of the retort, and this fubftance may be made into excellent black lead pencils:

There are two ways of making fteel, namely, by fufion and by cementation. The firft way is ufed to convert iron into fteel immediately from the ore, or from crude or caft-iron. By the fecond way, bar-iron is expofed to a long continued heat furrounded by charcoal. Each of thefe ways has advantages peculiar to itfelf; but the fame caufes in fact predominate in both, for both kinds of feel are produced by heat and charcoal. The only difference between the two methods is this; in making feel by fufion the charcoal is not fo equally defended from the accefs of air as in the other way.

Swedenbororins has given the following defcription of the method ufed in Dalecarlia for making fteel from caft-iron. The ore from which the crude iron to be converted into fteel is obtained is of a good kind. It is black, friable, and compofed of many finall grains, and it produces very tough iron. The converfion into fteel is made upon a forge-hearth, fomething fmaller than common. The fides and bottom are made of caft-iron. The tuyere is placed, with very little inclination, on one of the fide-plates. The breadth of the fire-place is fourteen inches; its length is greater. The lower part of the tuyere is fix inches and a half above the bottom. In the interior part of the fire-place there is an oblong opening for the flowing of the fuperfluous fcoriz. The workmen firlt put fcoriz on the bottom, then charcoal and powder of charcoal, and upon thefe the calt-iron run or cut into fmall pieces. They cover the iron with more charcoal, and excite the fire. When the pieces of iron are of a red white, and before they begin to melt, they fop the bellows, and carry the mafs under a
large hanmer, where they break it into pieces of three or four pounds each. The pieces are again brought to the hearth, and laid within reach of the workman, who plunges fome of them into the fire, and covers them with coal. The bellows are made to blow flowly till the iron is liquefied. Then the fire is increafed; and when the fulion has been long enough continued, the fcorix are allowed to flow out; and at that time the iron liardens. The workman adds more of the pieces of crude iron, which he treats in the fame manner ; and fo on a third and a fourth time, till he obtains a mafs of fteel of about a hundred pounds, which is generally done in about four hours. This mafs is raifed and carried to the hammer, where it is forged, and cut into four pieces, which are farther beat into fquare bars four or five feet long. When the fteel is thus forged, it is thrown into water that it may be eafily broken ; for it is yet crude and coarfe-grained. The fteel is then carried to another hearth fimilar to the former, and there broken in pieces. Thefe pieces are laid regularly in the fire-plaee, firft two parallel, upon which feven or eight others are placed acrofs; then a third row acrofs the fecond, in fuch a manner that there is fpace left between thofe of the fame row. The whole is then covered with charcoal, and the fire is excited. In about half or three quarters of an hour the pieces are made hot enough, and are then taken from the fire, one by one, to the hammer, to be forged into little bars from half a foot to two feet long, and while hot are thrown into water to be hardened. Of thefe pieces fixteen or twenty are put to rether fo as to make a bundle, which is heated and welded, and afterwards forged into bars four inches thick, which are then broken into pieces of convenient length for ufe.

The method of converting iron into feel by cementation is a very fimple procefs. It confilts folely in expofing it for a certain time to a ftrong degree of heat, while clofely covered with charcoal and defended from the external air. The furnaces employed for converting iron into fteel (fays a manufacturer of this metal) are of different fizes ; fome capable of converting only three or four tons weight, while others are capacious enough to contain from leven to eiglit or ten tons. The outfides of thefe furnaces rife up in the form of a cone, or fugar-loaf, to the height of a very confiderable number of feet. In the infide, oppofite to each other, are placed two very long chefts, made either of fone, or of bricks capable of bearing the ftronget fire; which is placed between the two chefts. The bars of iron, after the bottom is furnifhed with a neceffary quantity of charcoal duft, are laid in fratum fuper fratum, with intermediate beds of the charcoal dut, to fuch a height of the chefts as only to admit of a good bed at top; which is then all covered over, to prevent the admiffion of the common air ; which, conld it procure an entrance, would greatly injure the operation. The iron being thus fituated, the fire is lighted; which is fome time before it can be raifed to a fufficient degree of heat to produce any confiderable effect. After which it is continued for fo many days as the operator may judge proper; only now and then drawing out what they call a proof bar. This is done by openings fit for the purpofe at the ends of the cheft, which are eafily and with expedition ftopped up again, without occafioning any injury to the' contents left behind. When the opera-

\section*{S T E [77ク ] S T E}
tor apprehends the converfion is fufficiently completed, cold water; the other bar of fteel was cooled flowly over the fire is fuffered to go out, and the furnace, with its contents, is left gradually to cool. This may take up feveral days: after which the furnace is difcharged, by taking out the bars of fteel and the remainder of the charcoal dutt.
There is a manufactory eftablifhed in the parifh of Cramond, about five miles from Edinburgh, in which this method is practifed with great fuccefs. Great quantities of fteel are made there, which we have reafon to believe is of as excellent a quality as any that can be procured from other countries.

When the charcoal is taken out, it is found as black as before it was introduced into the furnace, unlefs by accident the external air lias got admittance. The bars preferve their exterior form only; the furface frequently exhibits a great number of tumors or blifters, whence they are called blifered fleel.

The hardnefs of fteel is much increafed by tempering. This confifts in heating it to a red heat, and then plunging it fuddenly into cold water. If it be allowed to cool flowly, it till preferves its ductility ; or if it be heated again after being tempered, it lofes its hardnefs, and again becomes ductile. In heating fteel for tempering it, the moft remarkable circumftance is, the different colours it affumes, according to the degree of heat it has received. As it is gradually heated, it becomes white, then yellow, orange, purple, violet, and at laft of a deep blue colour.

According to Reaumur, the fteel which is moft heated in tempering is generally the hardef. Hence it is believed, that the more violent the heat to which fteel is expofed, and the more fuddenly -it is plunged into cold water, the harder the fteel will be. Rinman, again, has deduced a conclufion directly oppofite, that the fteel which is naturally hardeft demands the leaft degree of heat to temper it. Different methods have been propofed to determine what degree of heat is moft proper ; but the eafieft method is to take a bar of fteel, fo long, that while one end is expofed to a violent heat, the other may be kept cold. By examining the intermediate portions, it may be found what degree of heat has produced the greateft hardnefs.

By tempering, fteel is faid to increafe both in bulk and in weight. Reaumur fays, that a fmall bar fix inches long, fix lines broad, and half an inch thick, was increafed at leaft a line in length after being tempered to a reddilh white colour ; that is, fuppofing the dilatation proportional in all dimenfions increafing at the rate of 48 to 49 . - Iron alfo expands when heated; but when the heat paffes off, it returns to its former dimen. fions. That the weight of fteel is alfo aurgented by tempering, has been found by experiment. Rinman having weighed exactly in an hydroftatic balance two kiiids of fine fteel made by cementation, and not tempered, found their denfity to be to that of water as 7,991 to 1 ; after being tempered, the denfity of the one was 7,553 , and that of the other 7,708 . M. de Morveau took three bars juft of a fize to enter a certain caliber 28 lines long, and each fide two lines broad; one of the bars was fort iron, and the two others were taken from the fame piece of fine fteel. In order to communicate an equal degree of heat to each, in an earthen veffel in the midtt of a wind furnace, the bar of foft gron and one of the bars of fteel were thrown into

Vow. XVII. 'Part II.
fome pieces of charcoal at a diftance from the furnace. The bar of iron and the one of fteel that was allowed to cool flowly paffed eafily into the caliber again; but the bar of tempered tteel was lengthened almoft oneninth of a line.

There is no doubt but tempering changes the grain; that is, the appearance of the texture of a piece of fteel when broken. This is the mark which is ufually obferved in judging of the quality of Iteel, or of the tempering which fuits it beft. 'I'he tempered bar is broken in feveral placez after having received different degrees of heat in different places. What proves completely the effect of heat noon the grain, at leaft in fome kinds of fteel, is, that a bar of tteel expofed to all the intermediate degrees of heat, from the finalleft fenfible heat to a red heat, is found to increafe in finenefs of grain from the flightly heated to the ftrongly heated end. The celebrated Rinman has made many experiments on the qualities of fteel expofed to different degrees of heat in tempering, but particularly to three kinds, viz. fteel heated to an obfcure red, to a bright red, and to a red white. Hard brittle fteel, made by cementation, and heated to an obfcure red and temper ed, exhibited a fine grain, fomewhat fhining, and was of a yellow white colour. When tempered at a bright red heat, the grain was coarfer and more fhining ; when tempered at a red white heat, the grain was alfo coarfe and fhining.

With a view to determine how far fteel might be improved in its grair by tempering it in different ways, M. de Morvean took a bar of bliftered fteel, and broke it into four parts nearly of the fame weight. They were all heated to a red heat in the fame fürnace, and withdrawn from the fire at the fame inftant. One of the pieces was left at the fide of the furnace to cool in the air, the fecond was plunged into cold water, the third into oil, and the fourth into mercury. The piece of fteel that was corled in the air refifted the hammer a long time berore it was broken; it was neceffary to notch it by the fle, and even then it was broken with difficulty. It fhowed in its fracture a grain fenfibly more fine and more fhining than it was before. The fecond piece, which had been plunged into water, broke eafily : its grain was rather tiner than the firft, and almoft of the fame white colour. The third piece, which was tempered in oil, appeared very hard when tried by the file; it was fcarcely poffible to break it. Its grain was as fine, but not quite fo brisht, as that which was tempered in water. The fourth piece, which was dipped into mercury, was evidently fuperior to all the reft in the finenefs and colour of the grain. It broke into many fragments with the firft ftroke of the hammer, the fractures being generally tranfverfe.
M. de Morveau was not altorether fatisfied with thefe experiments, and therefore thought it neceffary to repeat them with finer fteel. He took a bar of fteel two lines fquare, fuch as is ufed in Germany for tools by engravers and watchmakers; he divided it into four pieces, and treated them in the fame way as he had done the bliftered fteel. The firft piece, which was cooled in the air, it was very difficult to break: the fracture appeared in the midft of the grain very fine, but white and fhining. The fecond, which was tempered in water, was broken into three fragments at the

\section*{S T E}

Siect, Steelayard. colour, and of remarkable finenefs. One of its fides was polifhed, and a drop of the nitrous acid which was poured upon it left a black fot, but not deep. But when a drop of the fame acid was poured on the middle of the fracture, after it had been equally polifhed, it left a black fpot much deeper. 'The third piece, which was plnnged in oil, bent as eafily as the piece which was cooled in the air ; the fle made an impreffion on it with difflculty ; it was neceffary to break it with a vice: its grain was inferior in finenefs to the fecond, but it was of a darker colour. The fourth, which was tempered in mercury, exhibited a grain of an intermediate finenefs between the fecond and the third. From thefe experiments, it appears that fteel may be hardened by tempering it, not only with water, but with any other liquid which is capable of accelerating its cooling.

Steel may be unmade, or reduced to the fate of iron, by a management fimilar to that by which it is made, that is, by cementation. But the cement ufed for this purpofe mult be compofed of fubitances entirely frec from infiammable matter, and rather capable of abforbing it, as caleareous earth or quicklime. By a cementation with calcareous earth, continued during eight or ten hours, fteel is reduced to the ftate of iron. A fter it has been tempered, it may be again untempered, and foftened to any degree that we think proper; for which purpofe we have only to heat it more or lefs, and to let it cool flowly. By this method we may foften the hardeft-tempered fteel.

\section*{Steel. Bow' Tenants. See 'Tenure.}

Salt of Sterl. See Chemistry, nº 697.
STEEL-Yard, is one of the moft ancient prefents which fcience has made to fociety; and though long in defnetude in this country, is in moft nations of the world the only inftrument for afcertaining the weight of bodies. What is tranflated balance in the Pentateuch, is in fact fteelyard, being the word ufed by the Arabs to this day for their inftrument, which is a fteel yard. It is in common ufe in all the Afiatic nations. It was the Ratera of the Greeks and Romans, and feems to have been more confided in by them than the balance; for which reafon it was ufed by the goldfmiths, while the balance was the inftrument of the people.Non aurificis ftatera fed populari trutina examinare. Cic. de Or. \(2,38\).

The fteeiyard is a lever of unequal arms, and, in its moft perfect form, is conftructed much like a common balance. It hangs in fheers \(E\) (fig. r.) refting on the nail C , and the fcale L for holding the goods hangs by a nail D on the thort arm BC. The counter weight \(P\) hangs by a ring of tempered feel, made fharp in the infide, that it may bear by an edge on the long arm CA of the fteelyard. The under edge of the centre nail \(C\), and the upper edge of the nail D , are in the ftraight line formed by the upper edge of the long arm. Thus the three points of fufpenfion are in one ftraight line. The needle or index of the fteelyard is perpendicular to the line of the arms, and plays between the fheers. The fhort arm may be made fo maffive, that, together with the fcale, it will balance the long arm unloaded. When no goods are in the fcale, and the counter weight with its hook are removed, the fteelyard acquires a horizontal pofition, in confequence of its centre of gravity being below the axis of fufpenfion. The

\section*{S T E}
rules for its accurate conftruction are the fame as for Stcel-ya a common balance.

The inftrument indicates different weights in the following manner : The diftance CD of the two nails is confidered as an unit, and the lons arm is divided into a nuinber of parts equal to it ; and thefe are fubdivided as low as is thought proper: or in general, the long arm is made a fcale of equal parts, commencing at the edge of the nail C ; and the fhort arm contains fome de termined number of thofe equal parts. Suppofe, then; that a weight A of 10 pounds is put into the feale L. The counterpoife \(P\) mult be of fuch a werght, that, when hanging at the divifion 10 , it fhall balance this weight A. Now let any unknown weightit We pat into the fcale. Slide the hook of the counterpoife along the long arm till it balances this weight. Suppofe it then hanging at the divifion 38 . We conclude that there is \(3^{8}\) pounds in the fcale. This we do on the authority of the fundamental property of the lever, that forces acting on it, and balancing each other, are in the inverfe proportion of the diftances from the fulcrum to their lines of direction. Whatever weight the counterpoife is, it is to A as CD to 10, and it is to the weight W as CD to 38 ; therefore A is to the weight \(W\) as 10 to \(3^{8}\), and \(W\) is \(3^{8}\) pounds: and thus the weight in the fcale will always be indicated by the divifion at which it is balanced by the counterpoife.

Our well informed readers know that this fundamental property of the lever was difeovered by the renowned Archimedes, or at leaft firlt demonitrated by him ;. and that his demonftration, befides the defect of being applicable only to commenfurable lengths of the arms, has been thought by metaphyficians of the firlt note to. proceed on a poftulate which feems equally to need a demonftration. It has accordingly employed the utmoft refinement of the firft mathematicians of Europe to furnifh a demonftration free from objection. Mr D'Alembert has given two, remarkable for their inge nuity and fubtlety; Foncenex has done the fame ; and Profeffor Hamilton of Trinity-college, Dublin, has given one which is thought the leaft exceptionable. Виィ critics have even objected to this, as depending on a poitulate which fhould have been demonttrated.

Since we publithed the volume containing the article Mechanics, there has appeared (Phil. Tranf. 1794) a demonftration by Mr Vince, which we think unexceptionable, and of fuch fimplicity that it is aftonifhing that it bas not occurred to any perfon who thinks ona the fubject. Our readers will not be difpleafed with an account of it.

Let AE (fig. 2.) be a mathematical lever, or in. flexible ftraight line, refting on the prop A, and fupported at E by a force acting upwards. Let two equid weights \(b\) and \(d\) be hung on at B and D , equiditante from \(A\) and \(E\). Preffures are now exerted at \(A\) and \(\mathbf{E}\); and becaufe every circumftance of weight and diftance is the fame, the preflure at E, arifing fiom the action of the weight \(b\) on the point B , muft be the fame with the preflure at \(A\), arifing from the action of the weight \(d\) on the point D ; and the preffure at E , oc. cafioned by the weight \(d\), muft be the fame with the preffure at \(A\), occafioned by the weight \(b\). This mult be the cafe wherever the weights are hung, provided that the diftance AB and DE are equal. Moreover;

\section*{S T E}
yard. the fum of the preffures at \(A\) and \(E\) is unqueftionably equal to the fum of the weights, becaufe the weights are fupported folely at \(A\) and \(E\). Let the two weights be hurg on at \(C\) the middle point; the preffure at \(E\) is ftill the fame. Therefore, in general, the preffure excited at the point E , by two equal weights hanging at any points \(B\) and \(D\), is the fame as if they were hung on at the middle point between them: but the preffure excited at \(E\) is a juft meafure of the effort or energy of the weights \(b\) and \(d\) to urge the lever round the point \(A\). It is, at leaft, a meafure of the oppofite force which muft \(b\) : applied at \(E\) to fuftain or balance this preffure. A very faftidious metaphyfician may fill fay, that the demonftration is limited to a point E , whofe diftance from \(A\) is twice \(A C\), or \(=A B+A D\). But it extends to any other point, on the authority of a pofulate which cannot be refufed, viz. that in whatever "proportion the preffure at \(E\) is augmented or diminifhed, the preffire at this other point muft augment or diminifh in the fame proportion. This being proved, the general theorem may be demonftratedin all proportions of diftance, in the manner of Archimedes," "at once the mofl fimple, perfpicuous, and elegant of all.

We cannot help obferving, that all this difficulty (and it is a real one to the philofopher who aims at rendering mechanics a demonftrative fcience) has arifen from an improper fearch after fimplicity. Had Archimedes taken a lever as it really exifts in nature, and confidered it as material, confifting of atoms united by cohefion; and had he traced the intermediate preffures by whofe means the two cxternal weights are put in oppofition to each other, or rather to the fupport given to the fulcrum; all difficulty would have vanifhed. (See what is faid on this fubject in the article Strengith of Timber, \&c.)

The quantity of goods which may be weighed by this inftrument depends on the weight of the counterpoife, and on the diftance CD from the fulcrum at which the goods are fufpended. A double counterpoife langing at the fame divifion will balance or indicate a double quantity of goods hanging at D ; and any counterpoife will balance and indicate a double quantity of goods, if the diftance CD be reduced to-onehalf. Many fteelyards have two or more points oi fufpenfion D , to which the fcale may occafionally be attached. Fig. 6. of Plate XCI. Vol. H. reprefents one of thefe. It is evident, that in this cafe the value or indication of the divifions of the long arm will be diffe. rent, according to the point from which the fcale is fufpended. The fame divilion which would indicate 20 pounds when \(C D\) is three inches, will indicate 30 pounds when it is two inches. As it would expofe to chance of miftakes, and be otherwife troublefome to make this reduction, it is ufual to make as many divided fales on the long arm as there are points of fufpenfion D on the fhort arm; and each fcale having its own numbers, all trouble and all chance of miftake is avoided.

But thi range of this inftrument is not altogether at the pleafure of the maker. Befides the inability of a Aender beam to carry a great load, the divifions of the fcalc anfwering to pounds or half-pounds become very minute when the diftance \(C D\) is very thert; and the talance becomes lefs delicate, that is, lefs femfibly affect.
ed by fmall differences of weight. This is becaufe in Steel-yardfuch cafes the thicknefs which it is neceffary to give the edges of the nails does then bear a fenfible proportion to the diftance CD betweers them; fo that when the balance inclines to one fide, that arm is fenfibly fhorteried, and therefore the energy of the prepondera. ting. weight is leffened.

We have hitherto fuppofed the fteelyard to be in equilibrio when not loaded. But this is not neceffary, nor is it ufual in thofe which are commonly made. The long arm commonly preponderates confiderably. This makes no difference, except in the beginning of the fcale. The preponderancy of the long arm is equivalent to fome goods already in the fcale, fuppofe four pounds. Therefore when there are really 10 pounds in the fcale, the counterpoife will balance it when hanging at the divifion 6. This divifion is therefore réc. koned 10 , and the reft of the divifions are numbered accordingly.
A. fcientific examination of the iteelyard will convince us that it is inferior to the balance of equal arms in point of fenfibility: But it is extremely compendious and convenient ; and when accurately made and attentively ufed, it is abundantly exact for moft commercial purpofes. We have feen one at Leipzig which has been in ufe frnce the year 1718 , which is very fenfible to a difference of one pound, when loaded with nearly three tons on the fhort arm; and we faw a waggon loaded with more than two tons weighed by it in about fix minutes.

The fteelyard in common ufe in the different coun. tries of Europe is of a contruction ftill fimpler than what we have defcribed. It confifts of a batten of hârd wood, having a heavy lump A (fig. 3.) at one end, and a fwivel-hook B at the other. The groods to be weighed are fufpended on the hook, and the whole is carried in a loop of whip-cord C , in which it is fiid backward and forward, till the goods are balanced by the weight of the other end. The weight of the goods is eftimated by the place of the loop on a fcale of divifions in harmonic progreffion. They are marked (we prefume) by trial with known weights.

The chief ufe that is now made of the fteelyard in thefe kingdoms is for the weighing of loaded waggons and carts. For this it is extremely convenient, and more than funficiently exact for the purpofe in view. We fhall defcribe one or two of the moft remarkable; and we fhall begin with that at Leipzig already nentioned.

This fteelyard is reprefented in fig. 4. as run out, and juft about to be hooked foi litting up the load. The ftcelyard itfelf is OPQ, and is about 12 feet long. The fhort arm PQ has two points of fufpertion \(c\) and \(\dot{b}\); and the ftirrup which carries the chains for holding the load is made with a double hook, inftead of a double eye, that it may be eatily removed from the one pin to the other. For this purpofe the two hooks are connetted above by an liafp or ftaple, which goes over the arm of the fteclyard like an arch. This is repretented in the little figure above the iteelyard. The fufpenfion is flifted when the fteelyard is run in under cover, by hooking to this faple the rumning block of a fmail tackle which hangs in the door through which the fteelyard is rum out and in. This operation is ealy,

\section*{S T E [ 780 ] S T E}

Steel.yard. but necefiary, becaufe the firrup, chains, and the flage on which the load is placed, weigh tome hundreds.

The outer pin \(b\) is 14 inches, and the inner one \(c\) is feven inches, diftant from the great nail which refts in the fheers. The other arm is about \(10 \frac{1}{2}\) feet long, formed with an obtufe edge above. On the inclined plane on each fide of the ridge is drawn the fcale of weights adapted to the inner pin \(c\). The feales correfponding to the outer pin \(b\) are drawn on the upright fides. The counterpoife flides along this arm, hang. ing from a faddle-piece made of brafs, that it may not contract ruft. The motion is made eafy by means of rollers. 'This is neceffary, becaufe the counterpoife is greatly above a hundred weight. This faddle piece has like two laps on each fide, on which are engraved vernier fcales, which divide their refpective fcales on the arm to quarters of a pound. Above the faddle is an arch, from the fummit of which hangs a little plummet, which fhows the equilibrium of the ftelyard to the weigher, becaufe the fheers are four feet out of the houfe, and he cannot fee their coincidence with the needle of the fteelyard. Laftly, near the end of the long arm are two pins \(d\) and \(e\), for fufpending occafionally two eke weights for continuing the fcale. There are kept hanging on adjoining hooks, ready to be lifted on by a little tackle, which is alfo hooked immediately above the pins \(d\) and \(e\).
The feales of weights are laid down on the arm as follows. Let the eke weights appropriated to the pins \(d\) and \(e\) be called \(D\) and \(E\), and call the counterpoife C. Although the firrup with its chains and flage weigh fome hundreds, yet the length and fize of the arm OP gives it a preponderancy of 300 pounds. Here, then, the fcale of weights muft commence. The counterpoife weighs about 125 pounds. Therefore,
1. When the load hangs by the pin \(b, 14\) inches from the centre, the diftance from one hundred to another on the fcale is about in inches, and the firt fcale (on the fide of the arm) reaches from 300 to 1200 . In order to repeat or continue this, the eke-weight E is hung on the pin \(e\), and the counterpoife \(C\) is brought back to the mark 302; and the two together balance 1100 pounds hanging at \(b\). Therefore a fecond fcale is begun on the fide of the arm, and continued as far out as the firft, and therefore its extremity marks 2000; that is, the counterpoife C at 2000 and the eke-weight E at \(e\) balance 2000 hanging at \(b\).
2. To continue the fcale beyond 2000 , the load muft be hung on the inner pin \(c\). The eke-weight E is taken off, and the eke.weight D is hung on its pin d. The general counterpoife being now brought clofe to the fheers, it, together with the weight \(\mathbf{D}\) at \(d\), balance 2000 pounds hanging at \(c\). A fcale is therefore begun on one of the inclined planes a-top, and continucd out to 4000 , which falls very near to the pin \(d\), each hundred pounds occupying about five inches on the arm. To complete the fcale, hang on the ekeweight E on -its pin \(e\), and bring back the counterpoife to the fheers, and the threc together balance 3800 hanging at \(c\). Thcrefore when the counterpoife is now fid out to 4000 , it mult complete the balance with 5800 hanging at \(c\).
It required a little confideration to find out what proportion of the three weights \(C, D_{2}\) and \(E\), would
make the repetitions of the fcale extend as far as pof- Steel-s fible, having very little of it exprefied twice, or upon two fcales, as is the cafe here. We fee that the fpace correfponding to a firgle pound is a very fenfible quantity on both fcales, being one-ninth of an inch on the firt two fcales, and one twentieth on the laft two.
This very ponderous machine, with its maffy weights, cannot be eafily managed without fome affiftance from mechanics. It is extremely proper to have it fufceptible of motion out and in, that it may be protected from the weather, which would foon deftroy it by ruft. The contrivance here is very effectual, and abundantly fimple.

When the fteelyard is not in ufe, it is fupported at one end by the iron-rod \(F\), into which the upper end of the fheers is hooked. The upper end of this rod has a fron hook E, and a little below at \(a\) it is pierced with a hole, in which is a very ftrong bolt or pin of tempered Itel, having a roller on each end clofe to the rod on each fide. 'l'hefe rollers reft on two joits, one of which is reprefented by MN , which traverfe the building, with juft room enough between them to allow the rod \(F\) to hang freely down. The other end \(\mathbf{O}\) of the ftelyard refts in the bight of a large flat hook at the end of a chain \(W\), which langs down between the joints, and is fupported on them by a frame with rollers H . This is connected with the rollers at G , which carry the fheers by means of two iron-rods, of which one only can be feen. Thefe connect the two fets of rollers in fuch a manner that they muff always move together, and keep their ditance invariable. 'This motion is produced by means of an endlefs rope HI ZLKVH paffing over the pulleys I and K , which turn between the joilts, and hanging down in a bight between them. It is evident that by pulling on the part LZ we pull the frame of rollers in the direction \(\mathrm{GH}_{\text {, }}\), and thus bring the whole into the houfe in the pofition marked by the dotted figuie. It is allo plain, that by pulling on the part LK we force the roller frame and the whole apparatus out again.
It remains to fhow how the load is raifed from the ground and weighed. When the fteelyard is run out for. ufe, the upper hook \(E\) juft enters into the ring \(D\), which hangs from the end of the great oaken lever BCA about 22 feet long, turning on gudgeons at C about 5 feet from this end. From the other end \(\mathbf{A}\) defcends a long iron-rod SR, which has one fide formed into a toothcd rack that is acted on by a frame of wheel-work turned by an endlefs fcrew and winch \(Q\). Therefore when the hook \(E\) is well engaged in the ring \(\mathrm{D}, \mathrm{a}\) man turns the winch, and thus brings down the end A of the great lever, and raifes the load two or three inches from the ground. Every thing is now at liberty, and the weigher now manages his weights on the arm of the fteelyard till he has made an equi. librium.
We need not defrribe the operation of letting down the load, difengaging the ftelyard from the great lever, and bringing it again under cover. The whole of this fervice is performed by two men, and may be done in fucceffion by one, and is over in tive or fix minutes.
The moft compendious and economical machine of this kind that we have feen is one, frift. uled (we have heard) for weighing the riders of race-horfes, and afo

\section*{}
eel-yard. terwards applied to the more reputable fervice of weigh ing loaded carriages.
Fig. 5. is a plan of the machine. KLMN is the plan of a rectangular box, which has a platform lid or cover, of fize fufficient for placing the wheels of a cart or waggon. The box is about a foot deep, and is funk into the ground till the platform cover is even with the furface. In the middle of the box is an iron lever fupported on the fulcrum pin \(i k\), formed like the nail of balance, which refts with its edge on arches of hardened ffeel firmly faftened to the bottom of the box. This lever goes through one fide of the box, and is furnihhed at its extremity with a hard fteel pin \(l \mathrm{~m}\), allo formed to an edge below. In the very middle of the box it is croffed by a third nail of hardened fteel \(g h\), alfo formed to an edge, but on the upper fide. Thefe three edges are in one horizontal plane, as in a well made balance.
In the four corners \(\mathrm{A}, \mathrm{A}^{\prime}, \mathrm{E}^{\prime}, \mathrm{E}\), of the box are firmly fixed four blocks of tempered fteel, having their upper furfaces formed into fpherical cavities, well polifhed and hard tempered. ABCDE reprefents the upper edge of an iron bar of confiderable ftrength, which retts on the cavities of the fteel blocks in A and E , by means of two hard fteel ftuds projecting from its under edge, and formed into obtufe angled points or cones. Thefe points are in a flraight line parallel to the fide KN of the box. The middle part C of this crooked bar is faced with hard-tempered fteel below, and is there formed into an edge parallel to AE and KN , by which it refts on the upper edge of the fteel pin \(g b\) which is in the lever. In a line parallel to AE, and on the upper fide of the crooked bar ACE, are fixed two ftuds or points of hardened fteel P and D projecting upwards above half an inclı. The platform-cover has four fhort feet like a ftool, terminated by hard fteel ftuds, which are fhaped into fpherical cavities and well polifhed. With thefe it refts on the four fteel points \(\mathrm{B}, \mathrm{B}^{\prime}, \mathrm{D}^{\prime}, \mathrm{D}\). The bar ACE is kneed in fuch a manner vertically, that the points \(\mathrm{A}, \mathrm{B}, \mathrm{D}, \mathrm{E}\) and the edge C are all in a horizontal plane. Thefe particulars will be better undertood by looking at the elevation in fig. 6. What has been faid of the bar ACE muft be underfood as alfo faid of the bar \(A^{\prime} \mathrm{C}^{\prime} \mathrm{E}^{\prime}\).

Draw through the centre of the box the line \(a b c\) perpendicular to the line \(\mathrm{AE}, \mathrm{BD}\). It is evident that the bar ACE is equivalent to a lever \(a b c\), having the fulcrum or axis AE refting with its extremity C on the pin \(b g\) and loaded at \(b\). It is alfo evident that \(a \mathrm{C}\) is to \(a b\) as the load on this lever to the preffure which it exerts on the pin \(g h\), and that the fame proportion . fubfirts between the whole load on the platform and the pres? fure which it exerts on the ping \(h\). It will alfo appear, on an attentive confideration, that this proportion is nowife deranged in whatever manner the load is placed on the platform. If very unequably, the two ends of the pia \(r b\) may be unequally preffed, andithe lever wrenched and ftrained a little; but the total preffure is not changed.

If there be now placed a balance or fteelyard at the fide LK, in fuch a manner that one end of it may be directly above the pin \(l m\) in the end of the lever EOF, they may be conneled by a wire or fender rod, and a weight on the other arm of the balance or fteelyard may be put in equilibrio with any load that can be laid on the platform. A fmall counterpoife being
firt hurng on to balance the apparatus when unloaded, any additional weight will meafure the load really laid on the platform. If \(a b\) be to \(a c\) as \(I\) to 8 , and EO to EF alfo as 1 to 8 , and if a common balance be ufed above; 64 pounds on the platform will be balanced. by one pound in the fcale, and every pound will be balanced by \(\frac{8}{4}\) th of an ounce. This would be a very convenient partition for moft purpofes, as it would enable us. to ufe a common balance and common weights to complete the machine: Or it may be made with a balance of unequal arms, or with a fleelyard.

Some have thought to improve this inftrument by uling edges like thofe of the nails of a balance, inftead
of points. But unlefs made with uncommon accuracy, uling edges like thofe of the nails of a balance, inftead
of points: But unlefs made with uncommon accuracy, they will render the balance very dull. The fmall deviation of the two edges \(A\) and \(E\), or of \(B\) and \(D\), from perfect parallelifm to KN, is equivalent to a broad furface equal to the whole deviation. We imagine that, with no extraordinary care, the machine may be made to weigh within \(\frac{x}{20 \sigma}\) th of the truth, which is exact enough for any purpofe in commerce.

It is neceffary that the points be attached to the bars. Some have put the points at \(A\) and \(E\) in the blocks of fteel faftened to the bottom, becaufe the cavity there lodged water or dirt, which foon deftroyed the inftrument with rult. But this occafions a change of proportion in the firf lever by any fhifting of the crooked bars ; and this will frequently happen when crooked bars ; and this will frequently happen when-
the wheels of a loaded cart are pufhed ou the platformThe cavity in the fteel ftud hould have a little rim round it, and it hould be kept full of oil. In a nice machine a quarter of an inch of quickfilver would effectu- ally prevent all thefe inconveniences.
'I'he fimpleft and moft economical form of this ma. chine is to have no balance or fecond fteelyard ; but."
to make the firf fteelyard EOF a lever of the firft chine is to have no balance or fecond fteelyard ; but"
to make the firft fteelyard EOF a lever of the firft kind, viz. having the fulcrum between O and F , and
allow it to project far. beyond the box. The long or kind, viz. having the fulcrum between O and F , and
allow it to project far beyond the box. The long or outward arm of this lever is then divided into a fcale of weights, commencing at the fide of the box. A counterpoife muft be chofen, fuch as will, when at the beginninir of the fcale, balance the fmalleft load that will probably be examined. It. will be convenient to carry on this fcale by means of eke-weights hung on at the extremity of the lever, and to ufe but one moveable weight. By this method the divifions of the fcale
will have always one value. 'The beft arrangement is weight. By this method the divifions of the fcale
will have always one value. The beft arrangement is as follows: Place the mark O at the beginning of the fcale, and let it extend only to 100, if for pounds; or to fcale, and let it extend only to 100 , if for pounds ; or to eke-weights. be numbered. \(1,2,3\), \&c. Let the
loweft weight be marked on the beam. Ihis is al. eke-weights. be numbered. I, 2, 3, \&c. Let the
loweft weight be marked on the beam. This is al. ways to be added to the weight fhown by the operantion. Let the eke-weights ftand at the end of the beam, and let the general counterpoife always hang at O. When the cart is put on the platform, the end of the beam tilts up. Hang on the heavieft eke-weight that is not fufficient to prefs it down. Now complete the ba-lance by fliding out the counterpoife. Suppofe the conftant load to be 312 lb . and that the counterpoife
ftands at 86 , and that the eke-weight is 9 ; we have the confant load to be 312 lb . and that the counterpoife
ftands at 86 , and that the eke-weight is 9 ; we have the load \(=986+312,=1298 \mathrm{lbs}\)

STEELE (Sir Richard), was born about the year 1676 in Dublin; in which kingdom one branch of the family. was poffeffed of a confiderable eftate in the

Bteep.
 county of Wexford. His father, a counfellor at law in Dublin, was private fecretary to James duke of Ormond; but he was of Englifh extraction: and his fon, while very young, being carried to London, he put him to fchool at the Charter houfe, whence he was removed to Merton College in Oxford. Our author left the univerfity, which he did without taking any degree, in the full refolution to enter into the army. This ftep was highly difpleafing to his friends; but the ardour of his paffion for a military life rendered him deaf to any other propofal. Not being able to procure a better ftation, he entered as a private gentleman in the horfe guards, notwithftanding he thereby loft the fucceffion to his lrifh eftate. However, as he had a flow of good-nature, a generous opennefs and franknefs of fpirit, and a fparkling vivacity of wit, thefe qualities rendered him the delight of the foldiery, and procured him an enfign's commifion in the guards. In the mean time, as he had made choice of a profer fion which fet him free from all the ordinary reftraints in youth, he fpared not to indulge his inclinations in the wildeft exceffes. Yet his gaieties and revels did not pafs without fome cool hours of reflection; it was in thefe that he drew up his little treatife intitled The Chrifian Hero, with a defign, if we may believe himfelf, to be a check upon his paffions. For this purpofe it had lain fome time by him, when he printed it in I7OI, with a dedication to Lord Cutts, who had not only appointed him his private fecretary, but procured for him a company in Lord Lucas's regiment of Fufileers.

The fame year he brought out his comedy called The Funcral, or Grief à la mode. This play procured him the regard of King Willian, who rcfolved to give him fome effential marks of his favour; and though, upon that princc's death, his hopes were difappointed, yet, in the berinning of Queen Anne's reign, he was appointed to the profitable place of gazetteer. He owed this poft to the friendflip of lord Halifax and the earl of Sunderland, to whom he had been recommended by his fchool-fellow Mr Addifon. That gentleman alfo lent -him an helping hand in promoting the comedy called The Tender Hufbind, which was acted in 1704 with great fuccefs. But his next play, The Lying Lover, had a very different fate. Upon this rebuff from the Atage, he turned the fame humorous current into another chanmel; and early in the year 1709 , he began to publifh the T'atler: which admirable paper was undertaken in concert with Dr Swift. His reputation was perfectly eftablifhed by this work; and, during the courfe of it, he was made a commiffioner of the ftamp. duties in ryic. Upon the change of the minittry the fame year, he joised the duke of Marlborough, who had feveral years entertained a friendifip for lim; and upon his Grace's difmiffion from all employments in rili, Mr Steele addreffed a letter of thanks to him for the fervices which he had done to his country. However, as our author itill continued to hold his place in the famp-office under the new adminiftration, he forbore entering with his pen upon political fubjectis; but, adhering more clofely to Mr Addifon, he dropt the Tatler, and : afterwards, by the affitance chiefly of that fteady friend, he carried on the fame plan much improved, under the title of The Spectator. The fuccefs of this paperwas egual to that of the for-

\section*{782 ] S T E}
mer; which encouraged him, before the clofe of it, to proceed upon the fame defign in the character of the Guardian. This was opened in the beginning of the year 1713, and was laid down in October the fame year. But in the courfe of it his thoughts took a ftronger turn to politics: he engaged with great warmth againt the miniftry; and being determined to profecute his tiews that way by procuring a fear in the houfe of commons, he immediately removed all obftacles thereto. For that purpofe he took care to prevent a forcible difmiffion from his poft in the ftamp office, by a timely refignation of it to the Earl of Oxford; and at the fame time gave up a penfion, which had been till this time paid him by the queen as a fervant to the late prince George of Denmark. This done, he wrote the famous Guardian upon the demolition of Dunkirk, which was publifhed Aug. 7.1713; and the parliament being diffolved next day, the Guardian was foon followed by feveral other warm political tracts againt the adminittration. Upon the meeting of the new par* liament, Mr Steele having been returned a member for the borough of Stockbridge in Dorfethire, took his feat accordingly in the houfe of commons; but was e:xpelled thence in a few days after, for writing the clofe of the paper called the Englifbman, and one of his political pieces intitled the Crifis. Prefently after his expulfion, he publifhed propofals for writing the hiftory of the duke of Marlborough: at the fame time he alfo wrote the Spinfler ; and, in oppofition to the Examiner, he fet up a paper called the Reader, and continued pub. lifhing feveral other things in the fame firit till the death of the queen. Immediately after which, as a reward for thefe fervices, he was taken into favour by her fucceffor to the throne, king George I. He was appointed furveyor of the royal ftables at Hampton. Court, governor of the royal company of comedians, put into the commiffion of the peace for the county of Middlefex, and in 1755 received the honour of knighthood. In the mint parliament of that king, he was chofen member for Boroughbridge in York hire; and, after the fuppreffion of the rebellion in the notth, was appointed one of the commiffioners of the forfeited eftates in Scotland. In 1718, he buried his fecond wife, who had brought him a handfome fortune and a good eftate in Wales; but neither that, nor the ample additions łately made to his income, were fufficient to anfwer his demands. The thoughtlefs vivacity of his fpirit often reduced him to little chifts of wit for its fupport; and the project of the Fifh-pool this year. owed its birth chiefly to the projector's neceffities. This veffel was intended to carry fifh alive, and without wafting, to any part of the kingdom: but notwithitanding all his towering hopes, the fcheme proved very ruinous to him; for after he had been at an im. menfe expence in contriving and building his veffel, befides the charge of the patent, which he had procured, it turned, out upon trial to be a mere project. His plan was to bring falmon alive from the coalt of Ireland ; but thefe fifh, though fupplied by this contrivance with a continual ftream of water while at fea, yet unealy at their confinement, hattered themfelves to pieces againft the fides of the pool; fo that when they were brought to market they were worth very little.

The following year he oppofed the remarkable peerage bill in the houfe of commons; and, during the

\section*{S T E}

Steele.
courfe of this, oppofition to the court, his licence for actinu plays was revoked, and his patent rendered ineffectual, at the inftance of thie lord chamberlain. He did'lis utmoft to prevent fo great a lofs; and finding every direct avenue of approach to his royal mafter effectually barred againft him by his powertul adverfary, he had recourfe to the method of applying to the public, in hopes that his complaints would reach the ear of his fovereign, though in an indirect courfe, by that canal. In this firit he formed the plan of a periodical paper, to be publifhed twice a-week, under the title of the Theatre ; the firlt number of which came out on the 2 d of January 1719-20. In the mean time, the misfortune of being out of favour at court, like other misfortunes, drew after it a train of more. During the courfe of this paper, in which he had affumed the feigned name of Sir Fohn Edgar, he was outrageoufly attacked by Mr Dennis, the noted critic, in a very abufive pamphlet, intitled The Charager and Condud of Sir Fobn Edgar. To this infult our author made a proper reply in the Theatre.

While he was ftruggling with all his might to fave himfelf from ruin, he found time to turn his pen againtt the mifchievons South-Sea fcheme, which had nearly brought the nation to ruin in 1720; and the next year he was reftored to his office and authority in the playhoufe in Drury-Lane. Of this it was not long before he made an additional advantage, by bringing his celebiated comedy called the Confious Lovers upon that ftage, where it was acted with prodigious fuccefs; fo that the receipt there mult have been very confiderable, befides the profits accruing by the fale of the copy, and a purfe of 5 col . given to him by the king, to whom he dedicated it. Yet notwithftanding thefe ample fupplies, about the year following, being reduced to the utmoft extremity, he fold his fhare in the play-houfe; and foon after commenced a law-fuit with the managers, which in 1726 was determined to his difadvantage. Having now again, for the laft time, brought his fortune, by the moft heedlefs profufion, into a defperate condition, he was rendered altogether incapable of retrieving the lofs, by being feized with a paralytic diforder, which greatly impaired his underftanding. In thefe unhappy circumftances, he retired to his leat at Languanor near Caermarthen in Wales, where he paid the laft debt to nature on the 21ft of September 1729, and was privately interred, according to his own delire, in the church of Caermarthen. Among his papers were found the manuicripts of two plays, one called The Gentlemen, founded upon the eunuch of Terence, and the other intitled The Scloool of ARion, both nearly filifhed.

Sir Richard was a man of undiffembled and extenfive benevolence, a friend to the friendlefs, and, as far as his circumftances would permit, the father of every orphan. His works are chafte and manly. He was a ftranger to the nioft diftant appearance of envy or malevolence ; never jealous of any man's growing reputation; and fo far from arrogating any praife to himifelf from his conjunction with Mr . Addifon, that he was the firft who defired him to diftinguifh bis papers. His greateft error was want of economy : however, he was certainly the moft agreeable, and (if we may be allowed the expreffion) the mot innocent rake that ever trod the rounds of diffipation.

\section*{7831 S T E}

STEEPLE, an appendage erected generahy on the weftern end of churches, to hold the bells. Steeples are denominated from their form, either fpires or towers: the firt are fuch as afcend continually diminifhing either conically or pyramidally ; the latter are mere parallelopipeds, and are covered a-top platform.like.

STEERAGE, on board a fhip, that part of the fhip next below the quarter-deck, before the bulk head of the great cabin where the fteeriman ftands, in moft Mips of war. See Ste ering.
STEERING, in navigation, the art of directing the fhip's way by the movements of the helm ; or of applying its efforts to regulate her courfe when the advarices.

The perfection of fteering confifts in a vigilant at. tention to the motion of the Ihip's head, fo as to check every deviation from the line of her courfe in the firft inftant of its motion ; and in applying as little of the power of the helm as poffible. By this the will run more uniformly in a flraight path, as declining lefs to the right and left; whereas, if a greater effort of the helm is employed, it will produce a greater declination from the courfe, and not only increafe the difficulty of fteering, but alfo make a crooked and irregular tract through the water. See Helm.- - The helmfman fhould diligently watch the movements of the liead by the land, clouds, moon, or ftars; becaufe, although the conrfe is in general regulated by the compals, yet the vibrations of the needle are not fo quickly perceived as the fallies of the fhip's head to the right or left, which, if not immediately reftrained, will acquire additional velocity in every inflant of their motion, and demand a more powerful impulfe of the helm to reduce them; the application of which will operate to turn her head as far on the contrasy fide of her comrfe. -The phrafes ufed in fteering a fhip wary according to the relation of the wind to her courfe. Thus, if the wind is fair or large, the plrafes ufed by the pilot or officer who fuperintends the fleerage are, port, flarioard, and led'dy. T'he firlt is intenced to direct the mip's courle farther to the right; the fecond is to gruide lier farther to the left; and the laft is defigned to keep her exactly in the line wherem fhe advances, according to the courfe preferibed. The excefs of the firtt and fecond movement is called bard-a-port, and kard-a-farboard; the former of which gives her the greaicit poffible inclination to the right, and the lattes an squal tendency to the left. - If, on the contrary, the wind is foul or fant, the phafes are luff, thus, and no nearer: the fiyf of which is the order to keep her clofe to the wind; the fecond; to retain her itu her prefent fituation ; and the third, to keep her fails full.

In a thip of war, the exereife of fteering the thip is ufually divided amongt a number of the molt expert failons, who attend the heln in their tums; and are ach cordingly called timoneers, from the French term timonier, which Eignifies "helm@man." The Heerage is conftantly fuppervifed by the quarter-mafters, who alfo attend the hclm by rotation. In merchant- fhips every feaman takes his turr in this fervice, being directed therein by the mate of the watch, or fome other officer. -As the fafety of a fhip, and all contained therein, depends in a great meafure on the Ateerage or effects of the helm, the apparatus by which it is managed fhonld often be diligently examined by the proper officers. deed \({ }_{8}\)

\section*{S T E [ 784 [ \(\quad\) S T E}

Steganium deed, a negligence in this important duty appears alII Stem. mot unpardonable, when the fatal effects which may refult from it are duly confidered.

STEGANIUM. See Slate.
STEGANOGR \(\perp\) PHX, the art of fecret writing, or of writing in ciphers, known only to the perfons correfponding: See Cipher:

STELLARIA, Stichwort, in botany: A genus of plants belonging to the clafs of decandria, and order of trigynia; and in the natural fyftem arranged under the 22d order, Caryophyllea. The calyx is pentaphifllous and fpreading. There are five petals, each divided into two fegments. The capfule is oval, unilocular, and polyfpermous. There are nine fpecies, the nemorum, dichotoma, radians, holoftea, graminea, ceraftoides, undulata, biflora, and arenaria. - Three of thefe are Britifh plants. 1. Nemorum, broad-leaved ftichwort. The ttalks are about a foot or eighteen inches high, and branched in a panicle at the top. The leaves are heartShaped, and of a paler green on the under than on the upper fide ; the lower ones being fupported by footitalks which are hairy and channelled; the upper ones are feffile. The calys is erect, fomewhat hairy and white on the margins. The petals are bifid almoft to the bafe. There is a fmall nectarium between the longer ftamina and the calyx. - 2. Holofea, greater ttichwort. The falks are about two feet long; the petals are nearly twice the length of the calyx, and divided half-way to the bafe. It is common in woods and hedges.-3. Graminea, lefs ftichwort. The ftem is near a foot high. The leaves are linear and entire, and the flowers grow in loofe panicles. It is frequent in dry paftures. There is a variety of this fpecies called bog fichroort, with fmooth, oval, feffile leaves, and few leaves, which grows often in wet marhy places. 'The ftalk is quadrangular ; the petals fcarcely longer than the calyx, and bifid to the bafe.

STELLATE, among botanifts, expreffes leaves which grow not lel's than fix at a joint, and are arranged like the rays of a ftar.

STELLERA, German Groundsel, in botany: A genus of plants belonging to the clafs of ociandria, and order of monogynia; and in the natural fyltem arranged under the 3 Ift order, Vepreculd. There is no calyx. The corolla is quadrifid. The ftamina are very fhort. There is only one feed, which is black. The fpecies are two in number, pafferina and chamaejafme.

STELLIONATE, in the civil law, a kind of crime committed by a fraudulent bargain, where one of the parties fells a thing for what it is not; as if I fell an eftate for my own which belongs to another, or convey a thing as free and clear which is already engaged to another, or put off copper for gold, \&c.

STEM, in botany, that part of a plant arifing out of the root, and which fuftains the leaves, flowers,
fruits, \&c. By wafhing and rubbing the fems of trees, their annual increafe is promoted; for the method of doing which, fee the article \(\mathrm{T}_{\text {ree }}\).

Stem of a Ship, a circular piece of timber into which the two fides of a mip are united at the fore end: the lower end of it is fcarfed to the keel, and the bowfprit refts upon its upper end. The ftem is formed of one or two pieces, according to the tize of the veffel; and as it terminates the fhip forward, the ends of the wales and planks of the fides and bottom are let into a groove or channel, in the midfl of its furface, from the top to the buttom; which operation is called rabiting. The outfide of the ftem is ufually marked with a fcale, or divifion of feet, according to its perpendicular height from the keel. The intention of this is to afcertain the draught of water at the fore。 part, when the fhip is in preparation for a fea-voyage, \&c. The ftem at its lower end is of equal breadth and thicknefs with the keel, but it grows proportionally broader and thicker towards its upper extremity. See Ship-Building.

STEMMATA, in the hiftory of infects, are three fmooth hemifpheric dots, placed generally on the top of the head, as in molt of the hymenoptera and other claffes. The name was firft introduced by Linnæus.

STEMODIA, in botany : A genus of plants belonging to the clafs of didynamia, and order of angioSpermia; and in the natural fyftem ranging, under the 40th order, Perfonate. The calyx is quinquepartite ; the corolla bilabiated; there are four famina; each of the filaments are bifid, and have two antheræ. The capfule is bilocular. There is only one fpecies, the maritima.

STEMPHYLA, a word ufed by the ancients to exprefs the hufks of grapes, or the remains of the preffings of wine. The fame word is alfo ufed by fome to exprefs the remaining mafs of the olives, after the oil is preffed out.

STEMPHYLITES, a name given by the ancients to a fort of wine preffed hard from the hufks.

STEMPLES, in mining, crofs bars of wood in the fhafts which are funk to mines.

In many places the way is to fink a perpendicular hole, or haft, the fides of which they ftrengthen from top to bottom with wood-work, to prevent the earth from falling in.: the tranfverfe pieces of wood ufed to this purpolic they call fiemples, and by means of thefe the miners in fome places defcend, without ufing any rope, catching hold of thefe with their liands and feet.

STEMSON, in a fhip, an arching piece of timber fixed within the apron, to reinforce the fcarf thereof, in the fame manner as the apron fupports the fcarf of the ftern. In large thips it is ufually formed of two pieces.

\title{
S T E N O G R A P H Y (A).
}

C H A P. I.

THE art of ftenography, or mort writing, was known and practifed by moft of the ancient civilized nations. The Egyptians, who were diftinguifhed for learning at an early period, at firf expreffed their words by a delineation of figures called bieroglypbics, A more concife mode of writing feems to have been afterwards introduced, in which only a part of the fymbol or picture was drawn. This anfwered the purpofe of fhort-hand in fome degree. After them the Hebrews, the Greeks, and the Romans *, adopted different methods of abbreviating their words and fentences, fuited to their refpective languages. The iaitials, the finals, or radicals, often ferved for whole words; and various combinations of thefe fometimes formed a fentence. A rbitrary marks were likewife employed to determine the meaning, and to affift legi. bility; and it feems probable that every writer, and every author of antiquity, had fome peculiar method of abbreviation, calculated to facilitate the expreffion of his own fentiments, and intelligible only to himfelf.

It is alfo probable, that fome might by thefe means take down the heads of a difcourfe or oration; but few, very few, it is prefumed, could have followed a fpeaker through ail the meanders of rhetoric, and noted with precifion every fyllable, as it dropt from his mouth, in a manner legible even to themfelves.

To arrive at fuch confumnate perfection in the art was referved for more modern times, and is ftill an acquifition by no means general.

In every language of Europe, till about the clofe of the 16 th century, the Roman plan of abbreviating (viz. fublituting the initials or radicals, with the help of arbitraries, for words) appears to have been employed. Till then no regular alphabet had been invented exprefsly for Atenography, when an Englifh gentleman of the name of Willis invented and publifhed one (в). His plan was foon altered and improved, or at leaft pretended to be fo. One alteration fucceeded another; and at intervals, for a feries of years palt, fome men of inge"nuity and application have compofed and publifhed Vol. XVII. Part II.
fyftems of ftenography, and doubtlefs have themfelves reaped all the advantages that attend it. But among the various methods that have been propofed, and the different plans that have been adopted by individuals, none has yet appeared fortunate enough to gain general approbation; or proved fufficiently fimple, clear, and concife, to be univerfally ftudied and practifed.

Some fyftems are replete with unmeaning fymbols, perplexing arbitraries, and ill-judged contractions: which render them fo difficult to be attained by a common capacity, or ordinary application, that it is not to be wondered at if they have funk into neglect, and are now no longer known (c). Other fyftems, by being too prolix, by containing a multiplicity of charađters, and thofe characters not fimple or eafily remembered, become ineffectual to the purpofe of expedition, and are only fuperior in obfcurity to a common hand. Some, again, not only reject all arbitraries and contractions, but even prepofitions and terminations; which laft, if not too lavifhly employed and badly devifed, highly contribute to promote both expedition and legibility; and though they reduce their characters to fewer than can poffibly exprefs the various modifications af found, yet they make nearly one half of them complex. In the difpofition of the vowels, there is the greateft perplexity in moft fyltems. A dot is fometimes fubftituted for all the vowels indifcriminately, and the judrrment is left to determine which letter out of fix any dot is intended to exprefs.; or a minute fpace is allotted them; fo that unlefs they be arranged with mathematical precifon they cannot be diftinguifhed from one another; but fuch a minute attention is incoufiftent with the nature of hort-hand, which fhould teach us to write down in a fhort time, as well as in fmall bounds, what we wifh to preferve of what we hear. Nor is the plan of lifting the pen and putting the next confonant in the vowel's place, in the middle of words, lefs liable to objections; or that of reprefenting all the vowels by dittinet characters, being obviounly ill calculated for facility and difpatch, and confequently inadmiffible into any ufeful fyftem.

It is to be confeffed, that the perfon who firft pro5 G
pored
(A) The value of fenography is not unknown to the learned; and the care and fuccefs with which it has been lately cultivated in thefe kingdoms will, in all probability, foon render it an object of general attention. No one, however, appears to us to have fimplified and improved the art fo much as Dr Mavor, author of Univerfal Stenography, who has liberally permitted us to prefent our readers with a complete view of his fcheme. To thofe who wrif to become proficients in Short-writing, we earneftly recommend his entire publication (print. ed for Cadell and Davis, Strand, London), which in many fchools of the firt reputation now forms a deferved clafs book.
(в) Mr Locke fays, a rersular method of thort-writing feems to be known and practifed only in Britain. This is not now the cafe; and indeed there is no reafon to doubt whether characters may not be invented to exprefs the various founds, or letters, employed in any language, either ancient or modern.
(c) A lift of writers on ftenography. Mr Addy, Aldridge, Angell, Annet, Blandemore, Bloffet, Botley, Bridges, Byrom, Coles, Crofs, Dix, Everardt, Ewen, Facey, Farthing, Gibbs, Græme, Gurney, Heath, Holdfo worth, Hopkins, Jeake, Labourer, Lane, Lyle, Macauley, Mafon, Mavor, Metcalfe, Nicholas, Palmer, Rich, Ridpath, Shelton, Steele, Tanner, Taylor, Thickneffe, Tiffen, Webfter, Wefton, Williamfon, Willis, B. D. and Willio, \&c.
pofed the omiftion of vowels in the middle of words (D), which it is obvious are not wanted, and invented letters, which could be connected as in a running hand without lifting the pen in the middle of the word, made a real improvement on the works of his predeceffors. But, in fine, moft fyftems, either in their plan or execution, labour under fome capital defect, attended with circumftances highly difcouraging to the learner, and which in a great meafure defeat the end of their in. vention, by being too complicated to be learned with eafe and remembered with accuracy, or to be practifed with the expedition which is requifite; and fo difficult to be deciphered, that a man can fcarcely read what he has juft written.

To obviate thefe defects; to provide againft prolixity and concifenefs, which might occafion obfcurity ; to exhibit a fyftem founded on the fimpleft principles, which might be eafily learned and read, and yet be capable of the utmoft expedition-were the motives that gave rife to the prefent attempt.

This method will be found different from any yet publifhed, and fuperior to all in the difpofition of the vowels and the facility of arranging them; the confufion in placing which feems to detract from the merit of the beft performances on the fubject ; and it may be affirmed, without oftentation, that characters fimpler in their form, and more perfect in their union, have not been applied to the art of ftenography.

As well as it could be determined, the fimpleft characters are appropriated to the letters moft ufually employed : indeed, as far as poffible, thofe which are complex have been rejected; but as it was an object always kept in view that the writing fhould be on a line, a few are admitted into the alphabet for that reafon.,

The characters for the double aud triple confonants are the eafieft that could be invented, confiftent with perfpicuity ( E ); for care has been taken to provide againft all obfcurity which might arife by adopting letters too fimilar in their formation; and with re. fpect to the prepofitions and terminations, thofe which occur moft frequently are expreffed by the fimpleft characters, which will be found perfeetly cafy in their application.

The arbitraries are few in number ( F ), and the arbitrary abbreviations, as they are entirely from the letters of the alphabet, and chofen from fome thoufands of words in common ufe, will well repay the learner for an hour's trouble in committing them to memory.
'The latt chapter lays down a fchéme of abbreviation, comprifed in a few rules, perfectly eafy to be underftood and practifed by proficients in this art, which we hope will anfwer the expectation of the author, and will be
found free from the perplexity complained of in many fyftems where abbreviation is admitted. The principal rules are new, are fo eafy, fo extenfive in their ure, and fo confiftent with expedition and legibility, if applied with judgment, that they alone might fuffice. The learner is however advifed by no means to adopt any of them, till experience has convinced him that they may be ufed without error or injury to legibility. All a.5. breviating rules are fuited to thoie only who have made fome progrefs in the ftenographic art; for although they certainly promote expedition in a wonderful manner, and afford the greateft eafe to a prolicient, yet a learner, as expedition is not his firft, though his ultimate view, fhould admit of nothing that in the leaft renders the reading difficult.

\section*{CHAP. II.}

The Englifh alphabet confifts of twenty-fix letters; Thegen fix of which are vowels, \(a, e, i, 0, u\), and \(y\); and the principle other twenty confonants, \(b, c, d, f, g, h, j, k, l, m, n\), ltenogr \(p, q, r, s, t, v, w, x\), and \(z\).

This alphabet, as is obferved by the beft grammarians that have written on the language, is both defective and redundant in exprefling the various modifications of found *.

Cuftom or prejudice has affigned fome letters a place, \({ }_{\text {Grazut }}\) L when others would with much more propriety ex- \({ }^{\text {Gramp }}\) prefs the fame found: and to this may be added, that Gram. feveral letters; fometimes in one word, feem to be ad- Sheridan? mitted for no other reafon than to perplex a young be- Leefures ginner or a foreigner, as an obftruction to true pronun- Elocution. ciation, and to add to the apparent length of the word, when they are entirely quiefcent and ufelefs. That this is the genius of the orthography of our language muft be perceived by the moft fuperficial obferver ; but no modern tongue is abfolutely free from the fame exceptions. In particular, the French has a great number of dormant letters, which, it is obvious, render the pronunciation more difficult and perplexing to learners ( c ).

But as it is neither our bufinefs nor our intention to propofe a mode of fpelling different from that in common ufe, when applied to printing or long-hand writing (fince feveral innovators in orthography have fallen into. contempt, and their plans have been only preferved as beacons to warn others of the folly of endeavouring to fubvert eftablifhed principles \(\hat{\rho}\) ) ; we fhall only obferve, that in ftenography, where the molt expeditious and \({ }_{y}\) Preface concife method is the beft, if confiftert with perfpicuity, Dicionar the following fimple rules are ftudioufly to be regarded and practifed.

Rule I. All quiefcent confonants in.words are to
(D) Mr Byrom rejeeted vowels entirely in the middle of werds, as others before him had only done partially. Without critically examining the executive part of his performance, which is very defective, it muft be owned, that it is above the reach of human ingenuity to exceed his general plan; which for ever mult be the bafis of every future rational fyftem.
(E) Thofe for \(t b\) and \(c b\) may be either made upright or floping to the right.
(F) Thefe are not by any means prefcribed; they may be employed or not according to the fancy of the learner.
(G) The Latin and Greek claim a juft fuperiority over every modern tongue in this refpect. In them noconfufion or daubt can arife, from the manner of fpelling; and the reader can fcarcely be wrong (unlefs in quanetity) in founding all the letters he fees.
be dropped; and the orthography to be directed only by the pronunciation : which being known to all, will render this art attainable by thofe who cannot fpell with precifion in long hand.

Rule II. When the abfence of confonants, not entirely dormant, can be eafily known, they may often be omitted without the leaft obfcurity.
Rule III. Two or fometimes more confonants may, to promote greater expedition, be exchanged for a fingle one of nearly fimilar found; and no ambiguity as to the meaning enfue ( H ).

Rule IV. When two confonants of the fame kind or fame found come together, without any vowel between them, only one is to be expreffed; but if a vowel or vowels intervene, both are to be written: only obferve, if they are perpendicular, horizontal, or oblique lines, they muft only be drawn a fize longer than ufual; and characters with loops muft have the fize of their heads doubled \(\|\).

Might is to be written mit, fight fit, machine ma/bin, enough enuf, laugh laf, prophet profet, phyfics ffiks, through thro', foreign foren, fovereign foveren, pfalm fam, receipt refet, write rite, wright rit, inland iland, knavery navery, temptation temtation, knife nife, flick fik, thigh thi, honour onour, indietment inditement, acquaint aquaint, chaos kaos; \&c.

Strength firenth, length lenth, friendflip fren/bip, connect conck, commandment comanment, conjunct conjunt, humble bumle, lumber lumer, number lumer, number numer, exemplary exemlary, \&c.

Rocks rox, acts aks or \(a x\), facts faks or fax, diftricts diftriks or diflrix, affects afeks or afex, affliets afliks or aflix, conquer konkr, \&c.

Letter leter, little litle, command comand, error eror, \({ }^{16}\) terror teror, \&ic. But in remember, moment, fifer, and fuch like words, where two confonants of the fame name have an intervening vowel, both of them mult be written.

Thefe four rules, with their examples, being carefully confidered by the learner, will leave him in no doubt concerning the difpofition and management of the confonants in this fcheme of fhort-writing; we fhall therefore proceed to lay down rules for the application of the vowels with eafe and expedition.

Rule I. Vowels, being only fimple articulate founds, though they are the connectivee of confonants, and employed in every word and every fyllable, are not necef. fary to be inferted in the middle of words; becaufe the confonants, if fully pronounced, with the affiftance of connection, will always difcover the meaning of a word, and make the writing perfectly legible.

RuleiI. If a vowel is not ftrongly accented in the incipient fyllable of a word, or if it is mute in the final, it is likewife to be omitted; becaufe the found of the incipient vowel is often implied in that of the firt confonant, which will confequently fupply its place.

Rule III. But if the vowel conftitutes the firf or laft fyllable of a word, or is ftrongly accented at its beginning or end, that vowel is continually to be written.

Rule IV. If a word begins or ends with two or more vowels though feparated, or when there is a coalition of vowels, as in dipthongs and tripthongs; only one of them is to be expreffed, which mult be that which agrees beft with the pronunciation.
- Rule V. In monoryllables, if they begin or end with a vowel, it is always to be inferted, unlefs the yowel be \(e\) mute at the end of a word.

Such are the general principles of this art ; in vindication and fupport of which it will be needlefs to offer any arguments, when it is confidered that brevity and expedition are the chief objects, if confittent with legibility; and the fubfequent fecimens in the orthography recommended will, we hope, be fufficient to fhow that there is no real deficiency in the laft mentioned particular.
He who md us mft be etrnl, grt, nd mnptnt. But al prd of ths frt is fly, nd evr to be avdd.

\section*{C H A P. III.}

As the whole of this art depends upon a regular method and a fimple alphabet, we have not only endeavoured to eftablifh the former on fatisfactory principles, but have been careful to appropriate, according to the comparative frequency of their occurrence, fuch characters for the letters as, after repeated trials and altera. tions, were conceived to be the beft adapted for dif. patch.
The ftenographic alphabet confifts of 18 diftinet cha-Stenograracters (viz. two for the vowels and the reft for the phicalphao confonants), taken from lines and femicircular curves; bet. the formation and application of which we fhall now explain, beginning with the vowels.

For the three firft vowels, \(a, e\), and \(i\), a comma is ap.
\({ }_{5} \mathrm{G}_{2}\).
propriated
( H ) By this rule likewife \(q\) and \(v\) in the middle of words, but never in the beginning, may be exchanged for \(k\) and \(f\), when they admit of an eafier connection with the following character, or will make the writing apm P : \% ueter.

\section*{S T E N O G R A P H Y.}
propriated in different pofitions; and for the other three, \(0, u\), and \(y\), a point. The comma and point, when applied to \(a\) and \(o\), is to be placed, as in Plate CCCCLXXXII. at the top of the next charaster; when for \(e\) and \(u\), oppofite to the middle; and when for \(i\) and \(y\), at the bottom.

This arrangement of the vowels is the moft fimple and diftinct that can eafily be imagined. Places at the top, the middle, and the bottom of characters, which make three different pofitions, are as eafily diftinguifhed from one another as any three feparate characters could be; and a comma is made with the fame facility as a point.
Simple lines may be drawn four different ways ; perpendicular, horizontal, and with an angle of about 45 degrees to the right and left. An afcending oblique line to the right, which will be perfectly diftinct from the reft when joined to any other character, may likewife be admitted. Thefe characters being the fimpleft in nature, are afingned to thofe five confonants which mott frequently occur, viz. \(l, r, t, c\) hard or \(k\), and \(c\) foft or \(s\).

Every circle may be divided with a perpendicular and horizontal line, fo as to form likewile four diftinct characters. Thefe being the next to lines in the fimplicity of their formation, we have appropriated them for \(b, d\), \(n\), and \(m\).
The characers expreffing nine of the confonants are all perfectly diftinct from one another; eight only re-
main which are needful, viz. \(f, g\) or \(j, b, p, q, v, w\), and \(x\). To find characters for which we mult have recourfe to mixed curves and lines. The characters which we have adopted are the fimpleft in nature afte: thofe already applied, admit of the eafieft joining, and tend to preferve lineality and beauty in the writing.
It muft be obferved that we have no character for \(c\) when it has a liard found, as in cofle; or foft, as in city; for it naturally takes the found of \(k\) or \(s\), which in all cafes will be fufficient to fupply its place.
\(R\) likewife is reprefented by the fame character as \(l\); only with this difference, \(r\) is written with an afcending ftroke ( 1 ), and \(/\) with a defcending ; which is always to be snown from the manner of its union with the following character; but in a few monolyllables where \(r\) is the only confonant in the word, and confequently ftands alone, it is to be made as is fhown in the alphabet for diftinction's fake.
\(Z\), as it is a letter feldom employed in the Englifh language, and only a coarfer and harder expreffion of \(s\), muft be fupplied by \(s\) whenever it occurs; as for Zedekiah write Sedekiah, \&c.

\section*{C H A P. IV.}

The prepofitions and terminations in this fcheme are fo fimple, that the greatef benefit may be reaped from
them, and very little trouble required to attain them; as the incipient letter or the incipient confonant of all \({ }^{R}\) wles \(f\) the prepofitions and of feveral of the terminations is ind ander ufed to exprefs the whole. But although in Plate nations CCCCLXXXII. fufficient fpecimens are given of the manner of their application, that the learner of lefs ingenuity or more flow perception may have every affit. ance, we have fubjoined the following directions.

Rule 1. The prepofition is always to be written without joining, yet fo near as plainly to fhew what word it belongs to ; and the beft way is to obferve the fame order as if the whole was to be connected.

Rule II. A prepofition, though the fame letters that conftitute it may be met with in the middle or end of a word, is never to be ufed, becaufe it would expofe to obfcurity.

Rule III. Obferve that the prepofition omni is expreffed by the vowel 0 in its proper pofition; and for anti, anta, ante, by the vowel \(a\), which the radical part of the word will eafily diftinguifh from being only fimple vowels.

The firft rule for the prepofitions is (allowing fuch exceprions as may be feen in the Plate) to be obferved for the terminations; and alfo the fecond mutatis mutatdis; except that whenever fis, fus, fys, cious, tious, and ces occur, they ate to be expreffed as directed in the fourth rule for the confonants, whether in the begin. ning, middle, or end of words ( K ).
Rule IV. The terminative character for tion, fionz cion, cian, tian, is to be expreffed by a fmall circle joined to the neareft letter, and turned to the right ; and the plurals tions, founs, cions, cians, tians, tience, by a dot on the fame fide.

Rule V. The terminative character for ing, is to be expreffed likewife by a fmall circle, but drawn to the left hand; and its plural ings by a dot ( \(L\) ).

Rule VI. The plural ligns is to be added to the terminative characters when neceffary.

Rule VII. The feparated terminations are never to be ufed but in polyfyllables or words of more fyllables than one.
'Thefe rules duly obferved will point out a method as concife and elezant as can be defired, for expreffing the moft frequent and longeft prepofitions and terminations in the Englith language. If it Aould be thought neceffary to increate their number by the addition of others, it will be an ealy matter for any one of the leaft difcernment to do fo, by proceeding on the principles before laid down.

\section*{C H A P. V.}

Though a more concife method of writing, or more Rules numerous abbreviations, may not be indifpenfably ne-abbre ceffary, if the foregoing directions be practifed for a tions confiderable time, yet contractions will be found extremely
(1) The character for \(h\), when lineality requires it, may be made from the bottom and inverted (fee Plate CCCCLXXXII.) And often \(h\) may be omitted entirely, or a vowel may be fubftituted in its ftead, without any injury to legibility, it being rather a breathing than letter.
( k ) But in a few words where three horizontal characters meet, it will be better to exprefs the \(\mathcal{j i s}\), \&c. by the femielliptical character in Plate CCCCLXXXII. oppofite tious.
( L ) In horizontal characters, by the left hand is meant the top, and by the right the fpace below the letter (fee \(i_{n g}\) joined, Plate CCCCLXXXII.) In all other characters the right and left pofitions will naturally be knowno
tremely ufeful and convenient to thofe who have attained a proper knowledge of the fubject, and lead to a greater degree of expedition, at the fame time that they diminifh the labour of writing. It has been obferved in the introduction, that abbreviations are only to be employed by proficients in this art ; becaufe expedition is not the firft, though the ultimate, object in view : and that an eafy legibility is of the utmoft confequence to the learner; which, however, cannot be preferved, if he adopts too foon thofe very rules which in time will afford him the greateft eafe when applied with judgement.

The following fhort and practical rules will be found, we hope, fully adequate to every purpofe for which they were intended, and are far fuperior in the facility of their application to any whicl we have feen.

Rues' . The ufual abbreviations in long-hand are always to be followed; as Mr for \(\mathrm{Mafter}, \mathrm{M} . \mathrm{D}\). for Doctor of Phyfic, and Abp. for Archbifhop, \&c.

Rule II. Subftantives, adjectives, verbs, and participles, when the fenfe will direct to the meaning, are to be expreffed by their initial confonant with the diftinguifhing marks exhibited in Plate CCCCLXXXII. viz. a fubftantive muft have the dot exactly over its initial confonant; an adjective muft have a dot under it ; a verb is to be expreffed by a comma over its initial confonant; and a participle by a comma under (m). Thefe being the four principal parts of fpeech will be fufficient; and an adept will never be at a lofs to know when he can with fafety apply this rule to them.

Rule III. 'To render the writing more legible, the laft letter of the word may be joined to the firt, and the proper mark applied.

Ruie IV. The conftituent or radical part of words, efpecially if they are long, will often ferve for the whole, or fometimes the firft fyllable; as, we ought to mode. rate our ex. by our circum.; a man's man. commonly Shape his for.

Rule V. All long words without exception may have their prepofitions or terminations expreffed by the incipient confonant of fuch prepofition or termination.

Rule VI. When there is a great dependence between the parts of a fentence, the initial letter will often fuffice; as \(L\). . is the capital of Great \(B\).; the eldeft \(S\). of the kins of Great \(B\). is ftyled prince of \(W\). Every one, it is prefumed, will allow this to be perfectly le. gible in long.hand, then why may it not in ftenography?

Rule VII. The terminatiens \(n e / s\) and lefs may be omitted; as faithfulnefs is only to be written faitbful; forwardnefs, forward; beedlefs, beed; ftubbornnefs, fub. born, \&c.

Rule VIII. The fecond and third perfons of verbs, ending in eth and \(e f\), may be expreffed by \(s\); as, he loves, thou teaches; inftead of he loveth, thou teacheft: or even without \(s\); as, he love, \&c.

Rule IX. Words may often be entirely omitted, and yet no ambiguity enfue; as, In beginning God crea.
ted beaven and earth, for In the berginning God created the heaven and the earth.

Rule X. When there is an immediate repetition of a fentence or word, a line is to be drawn under the fenterice or word to be repeared; as, Amen, Amen, is to written Amen; but if any words intervene before a word or fentence is to be repeated, the line muft be drawn as before, and a \(a\) or mark of omiffion placed where the repetition fhould begin; as, Is it juft the innocents foould be condemned \(A\) reviled ?

\section*{The Contents of the Stenograthic Plates.}

\section*{Fabricius's Reply to Pyrrbus.}

As to my poverty, you have indeed, Sir, been rightly Plate informed. My whole eftate confifts in a houfe of but ceccixasus? mean appearance, and a little fpot of ground, from which by my own labour I draw my fupport. But if by any means you have been perfuaded to think, that this poverty makes me lefs confidered in my country, or in any degree unhappy, you are extremely deceived. I have no reafon to complain of fortune, fhe fupplies me with all that nature requires; and if I am without fu. perfluities, I am alfo free from the defire of them. With thefe I confefs I fhould be more able to fuccour the neceffitous, the only advantage for which the wealthy are to be envied; but as fmall as my potfeffions are, I can ftill contribute fomething to the fupport of the flate and the affiftance of my friends. With regard to honours, my country places me, poor as I am, upon a level with the richeft: for Rome knows no qualifica. tions for great employments but virtue and ability. She appoints me to officiate in the moft auguft ceremonies. of religion; fhe entrufts me with the command of her armies; fhe confides to my care the moft important negotiations. My poverty wloes not leffen the weight and influence of my counfels in the fenate; the Roman people honour me for that very poverty which you con. fider as a difgrace; they know the many opportunities I have had in war to enrich myfelf without incurring. cenfure; they are convinced of my difinterefted zeal for their profperity; and if I lave any thing to complain of in the return they make, it is only the excefs. of their applaufe. What value then can I fet upon your gold and filver! What king can add any thing tomy fortune! Always attentive to difcharge the dutiesincumbent on me, I have a mind free from felf-reproach, and I have an honeit fame. Dodfey's Preceptor.

\section*{Letter to a Friend againgt wafte of Time.}

Converfe often with yourfelf, and neither lavifh your time, nor fuffer others to rob you of it. Many' of our hours are folen from us, and others pafs infenfibly away; but of both thefe loffes the moft frameful is that which happens through our own neglect. If we take the trouble to obferve, we Thall find that one confiderable part of our life is fpent in doing evil, and the other in: doing
( m ) The dot or comma being placed thus will never occafion them to be miftaken for vowels, becaufe they fhould always be on one fide or other; whereas the mark for parts of feeech muft conftantly be placed exactly over or under.

\section*{S T E N O G R A P H Y.}
doing nothing, or in doing what we fhould not do. We don't feem to know the value of time, nor how precious a day is ; nor do we confider that every moment brings us nearer our end. Reflect upon this, I entreat you, and keep a ftrict account of time. Procraftination is the moft dangerous thing in life. Nothing is properly ours but the inftant we breathe in, and all the reft is nothing ; it is the only good we poffers; but then it is feeting, and the firft comer robs us of it. Men are fo weak, that they think they oblige by giving of trifles, and yet reckon that time as nothing for which the moft grateful perfon in the world can never make amends. Let us therefore confider time as the moft valuable of all things ; and every moment fpent, without fome improvement in virttie or fome advancement in goodnefs, as the greateft fublunary lofs.

\section*{St Paul's Speech before Agrippa and Fefus.}

I think myfelf happy, king Agrippa, that I Thall anfwer for myfelf this day before thee, touching all things whereof I am accufed of the Jews: efpecially becaufe 1 know thee to be expert in all cutoms and queftions which are among the Jews, wherefore I befeech thee to hear me patiently. My manner of life from my youth, which was at firft among mine own nation at Jerufalem, know all the Jews, which knew me from the beginning (if they would teftify), that, after the ftraiteft feet of our religion I lived a Pharifee. And now I fand and am judged for the hope of the promife made by God unto our fathers : unto which promife our twelve tribes inflantly ferving God day and night hope to come; for which hope's fake, king Agrippa, I am accufed of the Jews. Why fhould it be thought a thing incredible with you, that God thould raife the dead, when God himfelf has given affurance of it unto all men, in that he hath raifed Chrift from the dead? As for my own part, moft noble Feftus, I own I once verily thought that even 1 myfelfought to do many things contrary to the name of Jefus of Nazareth. Which thing I alfo did in Jerufalem. I punifhed the faints oft in every fynagogue, and compelled them to blafpheme.; and being exceedingly mad againft them, I perfecuted them even unto ftrange cities. In purfuit of which, as I went to Damafcus, with authority and commiffion from the chief priefts: At mid-day, O king, I faw in the way a light from heaven, above the bright nefs of the fun, Chining about me, and them which journeyed with me. And when we were all fallen to the earth, I heard a voice fpeaking unto me, and faying in the Hebrew tongue, Saul, Saul, why perfecutcft thou me ? It is hard for thee to kick againft the pricks. And I faid, Who art thou, Lord ? And he faid, I am Jefus whom thou perfecuteft. But rife, and fand upon thy feet: for I have appeared unto thee for this purpofe, to make thee a minifter and a witnefs both of thefe things which thou haft feen, and of thofe things in which I will appear unto thee. Whereupon, O king Agrippa, 1 was not difobedient to the heavenly vifion: but fhewed firf unto them of Damafcus, and at Jerufalem, and throughout all the coafts of Judea, and then to the Gentiles, that they fhould repent and turn to God. For thefe caufes the Jews caught me in the temple, and went about to kill me. Having therefore outained help of God, I continue unto this day, witzaefling both to fmall and great, faying nowe other things
than thofe which the prophets and Mofes did fay mould come: That Chrift fhould fuffer, and that he fhould be the firf that fhould rife from the dead, and fhould fhow light unto the people, and to the Gentiles. This is the real truth: Believe me, I am no peftilent fellow, nor mover of fedition; but always endeavour all that lies in me to preferve a confcience void of offence towards God and towards man: nor can the Jews prove the things whereof they now accufe me. Neither am I, Feftus, befides myfelf; but fpeak thus freely before the king, becaufe he knows thefe things to be fact; yea, I am fully perfuaded the king knows them all to be fact; for they were not done in a corner. King Agrippa, believeft thou the prophets? I know that thou believeft. And would to God that not only thou but alfo all that hear me this day, were altogether fuch as I am except thefe bonds. Holmes's Rbetoric.

\section*{Pope to Atterbury.}

Once more I write to you as I promifed, and this once I fear will be the laft; the curtain will foon be drawn between my friend and me, and nothing left but to wifh you a long good night ; may you enjoy a fate of repofe in this life not unlike that fleep of the foul which fome have believed is to fucceed it, where we lie utterly forgetful of that world from whicli we are gone, and ripening for that to which we are to go. If you retain any memory of the paft, let it only image to you what has pleafed you beft; fometimes prefent a dream of an abfent friend, or bring you back an agreeable converfation. But, upon the whole, I hope you will think lefs of the time paft than the future ; as the former has been lefs kind to you than the latter infallibly will be. Do not envy the world your ftudies: They will tend to the benefit of men, againft whom you can have no complaint ; I mean, of all pofterity: and, perhaps, at your time of life, nothing elfe is worth your care. What is cvery year of a wife man's life but a cenfure or critic on the pat? Thofe \(x\) hofe date is the fhorteft, live long enough to laugh at one half of it: The boy defpifes the infant, the man the boy, the philofopher both, and the Chriftian all. You may now begin to think your manhood was too much a puerility ; and you will never fuffer your age to be but a fecond infancy. The toys and baubles of your childhood are hardly now more below you than thofe toys of our riper and our declining years; the drums and rattles of ambition, and the dirt and bubbles of avarice. At this time, when you are cut off from a little fociety, and made a citizen of the world at large, you fhould bend your talents not to ferve a party, or a few, but all mankind. Your genius fhould mount above that mift, in which its participation and neighbourhood with earth hath long involved it: To fhine abroad, and to heaven, ought to be the bufinefs and the glory of your prefent fituation. Remember it was at fuch a time that the greateft lights of antiquity dazzled and blazed the moft; in their retreat, in their exile, or in their death. But why do I talk of dazzling or blazing? it was then that they did good, that they gave light, and that they became guides to mankind. Thofe aims alone are worthy of fpirits truly great, and fuch I therefore hope will be yours. Refentment indeed may remain, perhaps cannot be quite extinguifhed, in the nobleft minds; but revenge will never harbour there: Higher principles
than thofe of the firt, and better principles than thofe of the latter, will infallibly influence men whole thoughts and whofe hearts are enlarged, and caufe them to prefer the whole to auy part of mankind, efpecially to fo fmall a part as one's fingle felf. Believe me, my Lord, I look upon you as a fpirit entered into another life, as one juft upon the edge of immortality, where the paffions and affections muft be much more exalted, and where you ought to defpife all little views and all mean retrofpects. Nothing is worth your looking back;
and therefore look forward, and make (as you can) the world look after you; but take care it be not with pity, but with efteem and admiration. I am, with the greateft fincerity and paffion for your fame as well as happinefs, your, \& c.

The above moft charming and moft affectionate let. ter was written about a month before Atterbury bifhop of Rochefter was fent into banifhment, and is unis: verfally admired.

\section*{S T E}

STENTOROPHONIC тUbe, a fpeaking trumpet; thus called from Stentor, a perfon mentioned by Homer. See Trumpet.
STEP, in a fhip, a block of wood fixed on the decks or bottom of a fhip, and having a hole in its upper fide, fitted to receive the heel of a malt or captern. The Ateps of the main and foremafts of every fhip reft upon the kelfon, to which they are firmly fecured by knees, bolts, or fpike-nails. The ftep of the mizen-malt ufually refts upon the lower deck.

STEPHANIUM, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 47 th order, Stellata. The calyx is monophyllous, turbinated, and quinquepartite; the corolla is monopetalous, finn-nel-fhaped, having its tubes curved and ventricofe: the pericarpium is a bilocular berry containing two feeds, flattened on one fide and round on the other. This genus is nearly allied to that of Pfychotria. There is only one fpecies, viz. Guianenfe, a native of the warmer parts of America.

STEPHANOPHORUS, in antiquity, the chicf prieft of Pallas, who prefided over the reft. It was ufual for every god to have a chief prieft ; that of Pallas was the Stephanophorus juft mentioned, and that of Hercules was called Dadouchus.-Stephanophorus was alfo a prieft that affifted the women in the celebration of the feftival Thefmophoria.

STEPHANUS (Byzantinns), an able grammarian, who lived in the 5 th or 6th century. He wrote a Dictionary, in which he made a great number of obfervations, borrowed from mythology and hiftory, which fhowed the origin of cities and colonies, of which we have nothing remaining but a mean abridgment by Hermolaus the grammarian ; but from that work the learned have received great light ; and Sigonius, Cafaubon, Scaliger, Salmafius, \&c. have employed themfelves in illuftrating it.
STEPHEN, king of England. See: England, n \({ }^{\circ}\) 108, \&c.
Stephen, or St Stephen's Day, a feftival of the Chriftian church, obferved on the 26th of December, in memory of the firft martyr St Stephen.

STEPHENS, a family of printers defervedly celebrated. They flourifhed at the revival of learning, and contributed a great deal towards difpelling the cloud of ignorance which had fo long overfhadowed Europe، Some of the claffics before the 16 th century were in a great meafure loft, and all of them were exccedingly corrupted. By their abilities and indefatigable induftry there defects were fupplied, and the learned were furnin-

\section*{S T E}
ed with beautiful and correct editions of the Greek and Stephene, Roman authors. Thus the world was not only fupplied with an inexhauftible fund of amufement and inftruction in thefe ancient writings; but it is to the ardour which they infpired, and to the model of elegance which they difplayed; that the prefent advanced fate of literature is in a great meafure owing.

Henry Stephens, the firt of thefe illuftrious men, was born in France, foon after the difcovery of printing, perhaps about the year 1465 . He fettled as a printer at Paris, and was probably patronized by Louis XII. A great proportion of the books which he publifhed were Latin: They are printed in the Roman letter, and are not inelegant, though fome of them abound rather too much in contractions. He died about the year 1520 , and left behind him three fons, Francis, Robert, and Charles. His widow married Simen de Colines (Colineus in Latin), who thus got poffeffion of Henry's printing houfe, and continued the profeffion till his death.

Of Erancis; the eldeft fon; little more is known than that he carried on bufinefs along with his father-in. law Colinæus, and that he died at Paris in 1550.
Robert Stephens, the fecond fon, was born in 1503. In his youth he made great proficiency in the Roman, Greek, and Hebrew languages, and at the age of 19 had acquired fo much knowledge, that his father-in-law entrufted him with the managernent of his prefs. An edition of the New ' C 'eftament vas publifhed under his infpection, which gave great offence to the Paris divines, who accufed him of herefy, and threatened to prevent the fale of the book. Soon afier he began bufinefs himfelf; and married Perrete the daughter of Jodocus Badius, a printer and an author. She was a woman of learning, and underftood Latin, which indeed was the neceffary confequence of her fituation. Her hufband always entertained a number of learned men as currectors of the prefs : Being foreigners, and of different nations, they made ufe of no other language but Latin ; which Perrete being accuftomed to hear, was able in a fhort time not only to underftand, but even to fpeak with tolerable eafe.

In. 153 I he publifhed his Latin "Thefaurus ;" 2 work of great importance, which he laboured at for two years. The mark which he put upon all his books was a tree branched, with a man looking upon it, and thefe words noli altum Sapere, to which he fometimes added Sed time. In 1539, Francis I. made him his printer, and ordered a new fet of elegant types to be founded for him. His frequent editions of the New 'Teftament \({ }^{-}\) gave great offence to the doctors of the Sorbonne, who 2. accufed.

\section*{S T E}

Stephens. \(\xrightarrow{\text { St- }}\) acculed him of herefy for his annotations, and infifted upon the fuppreffion of fome of his books. Although Henry the F'rench king in fome meafure protected him, the perfecution of thefe divines rendered him fo unhappy, not to mention the expence and lofs of time which an almoft conftant attendance at court unavoidably occafioned, that in \(155^{2}\) he abandoned his country and went to Geneva. Here he embraced the Proteftant religion, and thus juftified in fome meafure the fufpicions of his theological enemies. It has been affirmed by feveral writers that he carried along with him the royal types, and the moulds allo in which they were caft; but it is certain that he never afterwards made ufe of thofe types. Befides, is it poffible that the author of fo daring a theft could have been not only protected in Geneva, but even courted and honoured by the molt eminent men of the age? Is it credible that fuch a crime could have been concealed for 60 years; or that Henry, the fon and heir of the perpetrator, would have enjoyed the favour of the French king, if Robert Stephens had acted fuch a fhameful part ? If he was burnt in effigy at Paris, it was not for theft, but for having changed his religion. After his arrival at Geneva, he publifhed an account of the difpute between him and the Paris divines, which does as much honour to his abilities as his Thefaurus does to his learning. He died in 1559, after a life of the moft extraordinary induftry. 'The books of which he was the editor were not fewer than 360 . Many of them were ancient claffics in different languages. Several were accompanied with annotations which he collected, and all of them were corrected by collating manufcripts. He was fo anxious to attain perfect accuracy, that he ufed to expofe his proofs in public, and reward thofe who difcovered a miftake. His books confequently were very correct. It is faid that his New Teftament, called \(O\) Mirificam (becaufe the preface begins 'with thefe words), has not a fingle fault.

It was Robert Stephens who firf divided the New Teftament into verfes during a journey between Paris and Lyons. The advantages of this improvement are fully counterbalanced by its defects. It has deltroyed the unity of the books, and induced many commentators to confider every verfe as a diftinct and independent aphorifm. To this in fome meafure is to be afcribed the many abfurd interpretations and creeds that have been forced out of that book.

By his laft will his eftate was left exclufively to fuch of his children as fhould fettle at Gencva. He left behind him three fons, Henry, Robert, and Francis.

Charres Stephens, the third fon of Henry, was, tike the reft of his family, familiarly acquainted with the learned languages. 'I his recommended him to Lazarus de Baif, who made him tutor to his fon, and in 1540 carried him along with him to Germany. He fludied medicine, and practifed it with fuccefs in France. He did not, however, forfake the profeffion of his family , but exercifed it in Paris, where he became the editor of many books remarkable for neatnefs and elegance. He wrote above thirty treatifes on different fubjects, particularly on botany, anatomy, and hiftory. He died in 1564.

Robert Stephens, the fon of Robert the firit of that name, did not accompany his lather to Geneva, But continued to profefs the Catholic religion, and to

\section*{S T E}
retide at Paris, His letter was remarkably beautiful. - S'epher He was made king's printer, and died about 1589.

His brother Francis was alfo a printer. He embraced the Proteftant religion, and refided at Geneva.

Henry Stephens, the remaining fon of Robert, was born at Paris in 1528. He became the molt learned and moft celebrated of all his family. From his very birth almoft he gave proofs of uncommon abilities, and difplayed an ardent paffion for knowledye. 'The Medea of Euripides, which he faw acted while at fchool, firlt kindled his love for poetry, and infpired him with the defire of acquiring the language in which that tragedy is written. He intreated his father not to condemn him to ftudy Latin, which he already underfood from converdation, but to initiate him at once into the knowledge of Greek. His father willingly granted his requeft ; and Henry applied with fuch vigour, that in a fhort time he could repeat the Medea by heart. He afterwards ftndied Greek under Peter Danefius, who was tu• tor to the Dauphin, and finally heard the lectures of Tufanus and Turnebus. He became eager at an early age to underfland aftrology, and accordingly attended a profeffor of that myfterious art ; but he was not long in difcovering its abfurdity. At 19 he began his tra. vels, which he undertook in order to examine foreign libraries, and to become acquainted with learned men. He Epent two years in Italy, and returned into France completely mafter of Italian, and bringing along with him copies of feveral fcarce authors, particularly a part of A nacreon, which before was thought loft.

He found his father publifhing an edition of the New Teftament, to which he prefixed fome Greek verfes. Soon after, he vifited England and the Netherlands, where he met with John Clement, an Englifhman, to whom he was indebred for the remaining odes of Anacreon. During this journey he learned the Spanifh language, which was very much fpoken at that time in the Low Countries.

Whether Henry accompanied his father to Geneva or not is uncertain ; at lealt he muft have returned immediately to France, for we ind him foon after eftablifhed at Paris, and publining the odes of A nacreon. In 1554 he went to Rome, and thence to Naples. This journey was undertaken at the requeft, and in the fervice, of the French government. He was difcovered, and would have been arrefted as a fpy, had he not by his addrefs and Azill in the language of the country been able to pafs himfelf for a native of Italy. On his return to France he affumed the title of printer to Ulric Fugger, a very rich and learned German nobleman, who allowed him a confiderable penfion.

In 1560 he married a relation, as is generally fuppofed, of Henry Scrimigeour, a Scotch nobleman, with whom he was intimately acquainted. She was a womar, as he himfelf informs us, endowed with the nobleft fpirit and the moft amiable difpofitions. Her death, which happened in 1566, brought on a difeafe that had twice attacked him before. It was a difguft at all thofe purfuits which had formerly charmed him, an averfion to reading and the fight of books. It was probably occafioned by too conftant and fevere an application to literary purfuits. In 1572 he publifhed his Thefaurus Lingue Graca, one of the greateft works, perhaps, that ever was executed by one man, if we confi-

\section*{S T E [ 793 ] S T E}
der the wretched materials which more ancient dictionaries conld furnifh, if we confider the fize and perfection of the work, and the immenfe labour and learning which muft have been employed in the compilation. This work had been carried on at a greater expence than he could well bear. He expected to be reimburfed by the fale of the book, but he was unfortunately difappointed. John Scapula, one of his own fervants, extracted from it whatever he thought would be moft ferviceable to ftudents, and publifhed it beforehand in ąto. By this act of treachery Henry was reduced to poverty.

A bout this time he was much beloved by Henry III. of France, who treated hin fo kindly, and made him fuch flattering promifes, that he refided frequently at Court. But thefe promifes were never fulfilled, owing to the civil wars which foon after diftracted France, and the unfortunate death of king Henry himSelf. During the remainder of his life his fituation was very unfettled. We find him fometimes at Paris, fometimes in Geneva, in Germany, and even in Hungary. He died at Lyons in 1598, at the age of 70. He was fond of poetry from his very infancy. It was a cultom of his to compofe verfes on horfeback, and even to write them, though he generally rode a very mettlefome fteed. His Thefaurus was his great work, but he was alfo the author of feveral other treatifes. His poems are numerons: His Apology for Herodotus is a witty fatire on the Roman Catholics. His Concordance to the New 'Teftament muft have been a laborious work, and has defervedly endeared him to every Chriftian who wifhes to acquire a rational and critical knowledge of the Scriptures. The number of books which he publifhed, though fewer than his father, was great, and fuperior in elegance to any thing which the world had then feen. A great proportion of them were Greek; he was the editor, however, of many Roman and even of forme eaftern writings. His Greek claffics are remarkably correct ; the principal of them are Homer, Anacreon, Efchylus, Maximus Tyrius, Dindorus Siculus, Pindar, Xenophon, Thucydides, Herodotus, Sophocles, Diogenes Laertius, Plutarch, Plato, Apollonius Rhodius, Æfchynes, Lyfias, Callimachus, Theocritus, Herodian, Dionyfius Hallicarnaffenfis, Dion Caffus, Ifocrates, A ppian, Xiphilin, \&c. His temper in the latter part of his life is reprefented as haughty and fevere, owing probably to his difappointments. He left behind him a fon and two daughters, one of whom was married to the learned Ifaac Cafaubon,

Paul Stephens, the fon of Henry, continued his father's profeffion at Geneva. He was a man of learning, and wrote tranflations of feveral booke, and publifhed a confiderable number of the ancient claffics; but his editions poffefs little of his father's elegance. He died in 1627 , at the age of 60 , after felling his types to oneChouet a printer.- His fon Antony, the laft printer of the family, abandoned the Proteltant religion, and returned to France, the country of his anceftors. He reeeived letters of naturalization in 1612, and was made printer to the king; but managing his affairs ill, he was reduced to poverty, and obliged to retire into an hofpital, where he died in 1674 , miferable and blind, at the age of 8 c .

Stephens's Medicine for the Stome. See Alkalt, a 17.

Vor. XVII. Part II.

STERCORARIANS, or Stercoranistfe, formed from flercus "dung," a name which thofe of the Romifh church anciertly gave to fuch as held that the hoft was liable to digeftion, and all its confequences, like other food.

STERCULIA, in botany : A genus of plants belonging to the clafs of monacia, and order of monodelphia; and in the natural fyftem under the 38 th order, tricoccee. The male calyx is quinquepartite; there is no corolla, but there are 1 ; filaments. The female calyx is quin. quepartite; there is no corolla; the germen is placed on a pillar, and the capfule is quinquelocular, and manyfeeded. There are three fpecies, the balanghas, feetida, and platanifolium, all foreign plants.

STEREOGRAPHIC PROJECTION, is the projection of the circles of the fphere on the plane of fome one great circle, the eye being placed in the pole of that circle. See Prozection of the Sphere.
 folid, and \(\mu \varepsilon \tau \rho^{\prime}{ }^{\circ}\) meafure, that part of geometry which teaches how to meafure folid bodies, i. e. to find the folidity or folid contents of bodies; as globes, cylinders, cubes, veffels, fhips, \&c.

STEREOTOMY, formed from sepros, and \(\tau, \mu r\), fecion, the art or act of cutting folids, or making fections thereof; as walls and other membranes in the profiles of architecture.

STERILITY, barrenneis, in oppofition to fertility. It has been afferted by many authors, that all monfters produced by a mixture of different fpecies of animals, fuch as mules, are barren; but this does not hold univerfally, even with the mule, which is the inftance molt generally adduced. See Mule.

Sterility in women fometimes happens from a mifcarriage, or violent labour injuring fome of the genital parts; but one of the molt frequent caufes is the fuppreffion of the inenitrual flux. - There are other cautes ariling from various difeafes incident to thofe par's ; by which the uterus may be unfit to receive or retain the male feed;-from the tubæ fallopianæ being too fhort, or having loft their ercctive power ; in either of which cafes no conception can take place;-from univerfal dcbility and relaxation; or a local debility of the genital fyftem ; by which means, the parts having loft their rone or contractile power, the femen is thrown off immediately poft coitum;-from imperforation of the vagina, the uterus, or the tube, or from difeafed ovas, \&c. Fence medical treatment can only avail in cafes arifing from topical or univerfal debility ; in correcting irregularities of the mentrual flux, or in removing tumors, cicatrices, or conftrictions of the paffage, by the art of furgery.

ST'ERIS, in botany: A genus of plants belonging to the clafs of pentandria, and order of digynia. The calyx is quinquepartite; the corolla wheel-fhaped; the berry is unilocular, and many feeded. There is only one fecies, the javana, a foreign plant.

STERLING, an epithet by which genuine Englifh money is diftinguifhed. It is unneceffary to mention the various conjectures of antiquaries about the origin and meaning of this appellation. The molt probable Henry's opinion feems to be this, that fome artifts from Ger- Hifory of many, who were called Efterlings, from the fituation of tain, vol. their country, had been employed in fabricating our iii. p. 546 .

5 H
money,

\section*{S T E}

Stern, Sie-na.
money, which confifted chiefly of filver pennies; and that from thern the penny was called an eferling, and our money eferling or ferling money.

STERN, the pofterior face of a fhip; or that part which is reprefented to the view of a fpectator, placed on the continuation of the keel behind. The ftern is terminated above by the taffarel, and below by the counters; it is limited on the fides by the quarter-pieces, and the intermediate fpace comprehends the galleries and windows of the different cabins. See Quarter of a Ship, Ship, and Ship-building.
\(S_{\text {FRRN }}-F a f\), a rope uied to confine the flern of a fhip or boat to any wharf or jetty-head, \&c.
StrR.N-Moft, in fea lanouage, ufunlly denotes that part of a fleet of fhips which is in the rear, or fariheft a.ftern, as nppofed to head-moft.
\(S_{\text {TERN }}\) Poff, a long ftraight piece of timber erected on the extremity of the keel, to fuftain the rudder and terminate the flip behind.
This piece, which is expreffed by \(B\) in the pieces of the hull, Plate CCCCLIV. fig. r. ought to be well fecured and fupported; becaufe the ends of all the lower planks of the fhip's bottom are fixed in a channel, cut on its furface ; and the whole weight of the rudder is fuftained by it.
STERN-Sbeets, that part of a boat which is contained between the ftern and the aftmoft or hindmoft feat of the rowers. It is generally furnithed with benches to accommodate the paffengers. See Boat.
STERNA, the TERN; a genus of birds arranged under the order of paimipectes. The marks of this genus are a flraight, flender, pointed bill, linear nofirids, a flender and fharp tongue, very long wings, a fmall back toe, and a forked tail. There are 25 fecies, according to Dr Latham ; the cafpia, cayana, furinamenfis, fuliginofa, africana, ftolida, philippina, fimplex, nilotica, boyfi, friata, vittata, fpadicea, pifcata, hirundo, panaya, cinerea, alba, minuta, finenfis, auftralis, metopoleucos, fiffipes, rigra, and obfcura. Three of thefe only are found in Great Britain ; the hirundo, minuta, and fiflipez.
1. The birundo, common tern, or great fea-fwallov, weighs four ounces one-quarter; the length is 14 inches; the breadth 30 ; the bill and feet are of a fine crimfon; the former tipt with black, ftraight, fender, and fharp.pointed ; the crown, and hind part of the head, black; the throat, and whole underfide of the body, white; the upper part, and the coverts of the wings, a fine pale grey. The tail confifts of 12 feathers; the exterior edges of the three outmof are grey, the reft white; the exterior on each fide is two inches longer than the others: in flying, the bird frequently clofes them together, fo as to make them appear one flender feather.
This is a very common fpecies; frequents our feacoafts and banks of lakes and rivers during the fummer,
but moft common in the neighbourlood of the fea. It is found alfo in various parts of Europe and Afia, according to the feafon; in the fummer as far as Greencording to the feafon; in the fammer as far as Green-
land and Spizzergen, migrating in turn to the foutlo of Auftria and Greece. It lays three or four eggs abour Auftria and Greece. It lays three or four eggs abour
the month of June, of a dull olive colour, an inch and three quarters in length, marked with irregular black fpots, intermixed with fome others of a fmalier fize, and lefs bright ; the little end is almoft free from any mark-

\section*{S T E}
ings. Thefe are laid among the grafs or mofs. The young are hatched in July, and quit the neft very foon after. They are carefully fed by their parents, and fly in about fix weeks. This bird appears to have all the actions on the water which the fwallow has on land, fkimming on the furface, and feizing on every infect which comes in its way; befides which, the moment it fpies a fifh in the water, it darts into that element, and feizing its prey arifes as quickly to the place from which it dipped.

Thefe birds are alfo found in America; come into New England in May, and go away in autumn, and are called there the mackarel gull. At Hudion's Bay they are known by the name of black-head. They are obferved to lay their egrs in fmall hollows on the fhore, fometimes lined with a few leaves. 'They are often found in great numbers on the iflets in the middle of the rivers, and are thought good eating. The natives of Hudfon's Bay call them Kenouch ene ou kenfk. They are bold, not fearing mankind, and in the time of incubation will attack any one, frequently darting down fo as to touch a perfon's. hat, without his giving the lealt offence.
2.The minuta, or fmaller lea-fwallow, (called by Linnæus la us minuta), weishs only two ounces five grains; the length 8 inches and a half; the breadth 19 and a half. The bill is yellow, tipt with black; the forehead and cheeks white from the eyes to the bill is a black line; the top of the head and hind part black ; the breait and under fide of the body clothed with feathers fo clofely fet together, and of fuch an exquifite rich glofs and fo fine a white, that no fatin can be compared to it: the back and wings of a pale grey : the tail frort, lefs forked than that of the former, and white: the legs yellow : the irides dufky. - Thefe two foecies are very delicate, and feem unable to bear the inclemency of the weather on our fhores during winter, for we obferve that they quit. their breeding places at the approach of it, and do not return till fpring. The manners, launts, and food of this fpecies are the fame with thofe of the former ; but. they are far lefs numerous.
3. The fiflipes, or black tern, is of a middle fize between the firit and fecond fpecies. The ufuat length is 10 inches; the breadth 24 ; the weight two ounces and a half 'The head, neck, breatt, and belly, as far as the vent, are black ; beyond is white; the male has a whitefoot under its chin; the back and wings are of a deep afh colour : the tail is thort and forked; the exterior feather on each fide is white; the others afh-coloured: the legs and feet of a dufky red. Mr Ray calis this a cloven-footed gull, as the webs are depreffed in the middle, and form a crefcent. Thefe birds frequent frefh. waters, breed on their banks, and lay three finall eggs. of a deep olive colour, much fpotted with black. They are found during fpring and fummer in valt numbers in the Fens of Lincolufhire, make an inceffant noife, and feed on flies as well as water infects and fmall fifh. Birds of this fpecies are feen very remote from land. Kalm faw flocks of hundreds in the Atlantic Ocean, midway between England and America, and a later voyager faw one 240 leagues from the Lizard, in the fame ocean.

STERNE (Laurence), an Englifh writer of a very peculiar caft, was born at Clomweil, in the fouth of Ireland, on 24 th November 1713 . His father Roger Sterne was the grandfon of Sterne archbifhop of York, who has been fuppofed, we know not upon what grounds,

1a:bam's
Synopfis,
vol. vii.

\section*{S T E 「 \(7951 \quad\) S T E}
to have been the author of the excellent book intitled "The Wholc Duty of Man." Laurence inherited nothing of his anceftor's manner of writing, but rather refembled Rabelais, whofe wit he carried with him even into the pulpit.

In 1722 he was fent to fchool at Halifax in York. Thire, where he continued till 1732, when he was removed to Jefus College in Cambridge. How long he refided in college, or what progrefs he made in literature or fcience, is not known : his works difplay rather native genius than profound erudition. Upon quitting the univerfity he went to York, and being in orders was prefented to the living of Sutton by the intereft of his uncle Dr Sterne, a prebendary of that church. In 1741 he married, and was fonn afterwards made a prebendary of York, by the interelt allo of his uncle, who was then upon very good terms with him ; but "quickly quarrelled with him (he fays), and became his bittereft enemy, becaufe he would not be a party man!, and write paragraphs in the newfpapers." By his wife's means he got the living of Stillington, but remained near 20 years at Sutton, doing duty at both places. He was then in very good health, which, however, foon after forfook him ; and books, painting, fiddling, and fhooting, wcre, as he tells us, his amufements.

In i 760 , he went to London to publifh his two firt volumes of "Triftram Shandy;" and was that year prefented to the curacy of Coxwold. In 1762 he went to France, and two years after to Italy, for the recovery of his health; but his health never was recovered. He languifhed under a confumption of the lungs, without the flighteft depreffion of fpirits, till 1768, when death put a period to his terreftrial exiftence.

The works of Sterne are very generally read. They conlitt of, 1. The Life and Opinions of 'Trittram Shandy; 2. Sermons; 3. A Sentimental Journey ; 4. Letters, publifhed fince his death. In every ferious page, and in many of much levity, the author writes in praife of bencvolence, and declares that no one who knew him could luppofe him one of thofe wretches who heap misfortune upon misfortune: But we have heard anecdotes of him extremely well authenticated, which proved that it was eafier for him to praife this virtue than to practife it. His wit is univerfally allowed ; but many readers have perfuaded themfelves that they found wit in his blank pages, while it is probable that he intend. ed nothing but to amufe himfelf with the idea of the fage conjectures to which thefe pages would give occafion. Even his originality is not fuch as is generally fuppofed by thofe fond admirers of the Shandean manwer, who have prefumed to compare him with Swift, Arbuthnot, and Butler. He has borrowed both matter and manner from various authors, as every reader may be convinced by the learned, elegant, and candid comments on his works publifhed by Dr Farrier, in the fourth volume of the Memoirs of the Literary and Philofophical Society of Manchetter.

STERNOCOSTALES, commonly called the mufcali triangulares Jterni, in anatomy, art five pairs of Gefhy planes, difpofed more or lefs obliquely on each fide the fternum, on the infides of the cartilages of the fecond, third, fourth, fiftl, and fixth true ribs.

STERNO-hyoideus, in anatomy. See Table of the Mufcles, under the article Anatomy.

STERNOMANTIS, in antiquity, a defirnationSternomangiven to the Delphian prieftefs, mure ufually called Pr . THIA. - Sternomantis is alfo ufed for any one that had II 2 a prophefying demon within him.

STERNOMASTOIDAEUS, a mufcle. See Table of the Mufcles, inder Anatomy.

STERNOTHYRCIDEUS, a mufcle. See Table of the \(M u f_{c}\) les, under Anatomy.

STERNUM. See Anatomy, \({ }^{\circ} 37\).
STERNUTATIVE, or Sternutatory, a medicine proper to produce fneezing. See Sneezing.

S CETLIN, or Stettin, a feaport town of Germany, in the circle of Upper Saxony, and capital of Hither Pomerania, with the title of a duchy, and a caftle. It had long a famous fchool, which the wars of Germany never difturbed. The ancient dukes of Pomerania refided here; and it was taken by the elector of Brandeuburg in 1676 , but given to Sweden by the treaty of Nimeguen. In 1713 it fubmitted to the allies; and then the faid elector was put in poffeffion again of this important place, which is a bulwark to the Marche of Brandenburg; and the fortifications have been greatly improved. It is now a flourifhing place, and carries on a confiderable trade. It is feated on the river Oder, 72 miles north of Francfort, and 70 north by ealt of Berlin. E. Long. 14. 38. N. Lat. 53. 35 . The duchy is 125 miles in length, and borders upon Mecklenburg, and partly upon Brandenburg. 'I'he breadth is from 17 to 25 miles, and it is divided by the river Oder into two parts.

STEW, a fmall kind of fifh pond, the peculiar ufe of which is to maintain fifh, and keep them in readinels for the daily ule of the family, \&c.

Stews (from the French effuves, i. e. thermae, bal. neum), thofe places which were permitted in England to women of profeffed incontinency, and that for hire would proftitute their bodies to all comers; fo call ed, becaufe diffolute perfons at wont to prepare them felves for venereons acts by bathing; and hot baths were by Homer reckoned among the effeminate fort of pleafures. Thele ftews were fuppreffed by King Hen. VIII. about the year 1546 .

STEWARD (Jenefcallus, compourded of the Saxon feda, i. e. "room;" or fead and weard, " a ward" or " keeper"), an officer appointed in another's ftead or place, and always taken for a principal officer within his jurifdiction. Of thefe there are various kinds. The greateft officer under the crown is the lord high-fteward of England, an office that was anciently the inheritance of the earls of Leicefter, till forfeited by Simon de Mountfort to King Henry III. But the power of this officer is fo very great, that it has not been judged fafe to truft it any longer in the hands of a fubject, excepting only pro bac vice, occafionally : as to officiate at a coronation, at the arraignment of a nobleman for hightreafon, or the like. During his office, the fteward bears a white flaff in his hand; and the trial, \&c. ended, he breaks the Itaff, and with it his commifion expires. There is likewife a lord-fteward of the king's houfehold, who is the chief officer of the king's court, has the care of the king's houfe, and authority over all the officers and fervants of the houfehold, except fuch as belong to the chapel, chamber, and fable.

Steward, an officer in a fhip of war, appointed by the purfer to diftribute the different fpecies of provi-

Blackifone's
Commentaries, vol. iv
fions to the officers and crew; for which purpofe he is furnifhed with a mate and proper afliliants.

Court of the Lord High Steivard of Great Britain, is a court inftituted for the trial of peers indicted for treafon or felony, or for mifprifion of either. The office of this great magiftrate is very ancient, and was formerly hereditary, or at leaft held for life, or dum bene fe geffeoit : but now it is ufually, and hath been for many centuries paft, granted pro bac vice only; and it hath been the conftant practice (and therefore feems now to have become neceflary) to grant it to a lord of parliament, elie the is incapable to try fuch delinquent peer. When fuch an indictment is therefore found by a grand jury of freelolders in the King's.bench, or at the affizes before the juftices of oyer and terminer, it is to be removed by a writ of certiorari into the court of the lord highfteward, which has the only power to determine it. A peer may plead a pardon before the court of King'sbench, and the judges have power to allow it, in order to prevent the trouble of appointing an high.fieward merely for the purpofe of receiving fuch plea: but he may not plead in that inferior court any other plea, as guilty or not guilty of the indiatment, but only in this court ; becaufe, in confequence of fuch plea, it is poffible that judement of death might be awarded againft him. The king, therefore, in cafe a peer be indicted of treafon, felony, or mifprifion, creates a lord high-iteward pro hac vice by commiffion under the great feal; which recites the indictment fo found, and gives his Grace power to receive and try it Secundum legem et confuetudinem Anglia. Then when the indictment is regularly removed by writ of certiorari, commanding the inferior court to certify it up to him, the lord high-fteward directs a precept to a fergeant at arms, to fummon the lords to attend and try the indicted peer. This precept was formerly iffued to fummon only 18 or 20 felected from the body of the peers; then the number came to be indefinite; and the cuftom was for the lord-high-Iteward to fummon as many as he thought proper (but of late years not lefs than 23); and that thofe lords only fhould fit upon the trial; which threw a monftrous weight of power into the hands of the crown, and this its great officer, of felecting only fuch peers as the then predominant party fhould moft approve of. And accordingly, when the earl of Clarendon fell into difgrace with Charles II. there was a defign formed to prorogne the parliament, in order to try him by a fe. lect number of peers; it being doubted whether the whole houfe could be induced to fall in with the views of the court. But now, by fatute 7 W. III. c. 3. upon all trials of peers for treafon or mifprifion, all the peers who have a right to fit and vote in parliament thall be fummoned at leaft 20 days before fuch trial, to appcar and vote therein; and every lord appearing fhall vote in the trial of fuch peer, firt taking the oaths of allegiance and fupremacy, and fubferibing the declaration againft popery.

During the feffion of parliament, the trial of an indicted peer is not properly in the court of the lord highfeward, but before the court laft mentioned of our lord the king in parliament. It is true, a lord high-fteward is always appointed in that cafe to regulate and add weight to the proceedings: but he is rather in the nature of a fpeaker pro tempore, or chairman of the court, than the judge of it; for the collective body of the peets
are therein the judges both of law and fant, and the high-iteward las a vote with the rett in right of his peerage. But in the court of the lord high-iteward, which is held in the recefs of parliament, he is the fole judge of matters of law, as the lords trions are in matters of fact ; and as they may not interfere with him in regulating the proceedings of the court, fo he has no right to intermix with them in giving any vote upon the trial. Therefore, upon the conviction and attainder of a peer for murder in full parliament, it hath been holder: by the judges, that in cafe the day appointed in the judgment for execution fhould laple betore execution done, a new time of execution may be appointed by either the high court of parliament during its fitting, thongh no high-fteward be exilting, or, in the recefs of parliament, by the court of King's bench, the record being removed into that court.

It has been a point of fome controverfy, whether the biflops have now a right to fit in the court of the lord-high-fteward to try indictments of treafors and mifprifion. Some incline to imagine them included under the general words of the fatute of King William "all peers who have a right to fit and vote in parliament ;" but the expreffion had been much clearer, if it had been " all lords," and not " all pees ;" for though bifhops, on account of the baronies annesed to their bifhoprics, are clearly lords of parliament, yet their blood not being ennobled, they are net univerfally allowed to be peers with the temporal nobility: and perhaps this werd might be inferted purpofely with a view to exclude them. However, there is no inftance of their fitting on trials for capital offences, even upon impeachments or indictments in full parliament, much lefs in the court we are now treating of; for indeed they ufually withdraw voluntarily, but enter a proteft, declaring their right to flay. It is obfervable, that in the IIth chapter of the conftitutions of Clarendon, made in parliameit 1 Ith Hen. II. they are exprefsly excufd, rather than excluded, from fitting and voting in trials, when they come to concern life or limb: epifcopit, ficut cateri barones, debent intereffe judiciis cum baronibus, quoufque perveniatur ad diminulionem membrarum vel ad mortem. And Becket's quarrel with the king hereupon was not on account of the exception (which was agreeable to the canon law), but of the general rule, that compelled the bifhops to attend at all. And the determination of the houfe of lords in the earl of Danby's cafe, which hath ever fince been adhered to, is confonant to thefe conftitutions; "that the lords Spiritual have a right to ftay and fit in court in capital cafes, till the court proceeds to the vote of guilty or not guilty." It mult be noted, that this relolution extends only to trials in full parliament; for to the court of the lord high-fteward (in which no vote can be given, but merely that of guilty or not guilty), no bihop, as fuch, ever was or could be fummoned: and though the ftatute of King William regulates the proceedings in that court, as well as in the court of parliament, yet it never intended to new-model or alter its conftitution; and confequently does not give the lords firitual any right, in cafes of blood, which they had not before. And what makes their exclufion more reafonable is, that they have no right to be tried themfelves in the court of the lord high-Iteward, and therefore furely ought not to be judges there. For the privilege of being thus tried

\section*{S T E [797.] S T E}
depends upon nobility of blood rather than a feat in the houfe, as appears from the trials of popith lords, of lords under age, and (fince the union) of the Scotch nobility, though not in the number of the fixteen; and from the trials of females, fuch as the queen confort or dowager, and of all peereffes by birth; and peereffes by marriage alfo, unlefs they have, when dowarers, difparaged themfelves by taking a commoner to tileir fecond huband.
Stemard of the Cbiltern Hundreds. See Chiltern Hundreds.

STEWART (Dr Matthew), was in 1717 born at Rothlay in the ine of Bute, of which parifh his father was the minifter. Beiug intended for the church, he went through the ufual courfe of a grammar-fchool education, and was in 1734 received as a fludent into the univerfity of Glafgow. There he had the happinefs of having for his preceptors in moral fcience and in mathematics the celebrated profeflors Hutchefon and Simfon; by the latter of whom he was inftructed in what may not improperly be called the arcana of the ancient geometry.
Mr Stewart's views making it neceffary for him to remove to Edinburgh, he was introduced by Dr Simfon to Mr Maclaurin, that his mathematical fudies might fuffer no interruption; and he attended the lectures of that great malter with fuch advantage as might be expected from eminent abilities, directed by the judgment of him who made the philofophy and geometry of Newton intelligible to ordinary capacities. Mr Stewart, however, had acquired, from his intimacy with \(\operatorname{Dr}\) Simfon, fuch a predilection for the ancient geometry, as the modern analyfis, however powerfully recommended, could not leffen; and he kept up a regular correfpondence with his old matter, giving hinn an account of his progrefs and his difcoveries in geometry, and receiving in return many curious communieations refpecting the Loci Plani and the porifms of Euclid. See Porism and Simson.
While the fecond invention of porifms, to which more genius was perhaps. required than to the firft difcovery of them, employed Dr Simfon, Mr Stewart purfued the fame fubject in a different and new direction. In doing fo, he was led to the difcovery of thofe curious and interefting propofitions whicll were publifhed under the title of General Theorems in 1746. They were given without the demonflrations; but did not fail to place their difcoverer at once among the geometers o! the firt rank. They are for the mofl part porifms, though Mr Stewart, careful not to anticipate the difcoveries of his friend, gave them no other name than that of theotems.
Our author had before this period entered into the church; and obtained, through the patrolage of the duke of Argyle and the earl of Bute, the living of Rofeneath, a retired country panifh in the weft of Scot. land: but in 1747 he was elected to the mathematical chair in the univerfity of Edinburyh, which had become vacant the year before by the death of Mr Maclaurin. The duties of this office gave a turn fomewhat different to his purfuits, and led him to think of the moft fimple and elegant means of explaining thofe difficult propofitions which were hitherto only acceffible to men deeply verfed in the modern analyfis. In doing this, he was purfuing the object which of all others he moft ardent-
ly wifhed to attain, viz. the application of geometry to fuch problems as the algebraic calculus alone had been thought able to refolve. His folution of Kepler's problem was the firt fpecimen of this kind which be gave to the world ; and it was impoffible to have produced one more to the credit of the method he followed, or of the abilities with which he applied it. On this problem the utmoft refources of the integral calculus had been employed. But though many excellent folutions had been given, there was none of them at once direct in its method and fimple in its principles. Mr Stewart was fo happy as to attain both thele objects; and his folution appeared in the fecond volume of the Effays of the Philofophical Society of Edinburgh for the year 1756. In the firf volume of the fame collection there are fome other propofitions of Mr . Stewart's, which are an extenfion of a curious theorem in the fourtla book of Pappus. They have a relation to the fubject of porifms, and one of them forms the gift of Dr Simfon's. Reltoration. They are befides very beautiful propofitions, and are demontrated with all the elegance and fimplicity of the ancient analy yis.

The profecution of the plan whicli he had formed of introducing into the higher parts of mixed mathematics the ftrict and fimple form of ancient demonftration, produced the Tracts Pbyfical and Matbematicals, which were publifhed in \(\mathbf{1 7 6 1}\), and the EJay on the Sun's Difance, which was publifhed in 1763 . In this latt work it is acknowledged that he employed geometry on a talk which geometry cannot perform ; but while it is. granted that his determination of the fun's diftance is. by no means free from error, it may fafely be afferted that it contains a. great deal which will always intereft geometers, and will always be admired by them. Few errors in fcience are redeemed by the difplay of fo much: ingenuity, and what is more fingular, of fo much found reafoning. The inveftigation is everywhere elegant, and will probably be lons regarded as a fpecimen of the mof arduous inquiry which has been attempted by mere geometry.
The Sun's Difance was the laft work which Dr Stewart publifhed; and though he lived to fee feveralanimadverions on it made public, he declined entering into any controverfy. His difpofition was far from polemical; and he knew the value of that quiet which aliterary man fhould rarely fuffer his antagonifts to interrupt. He ufed to fay, that the deciition of the point in queftion was now before the public ; that if his inveftigation was right it would never be overturned, and that if it was wrong it ought not to be defended. A. few months before he publifhed the effay juft mentioned, he gave to the world another work, intitled. Propofitiones Geometrica More Veterum Demonffrata. This title, it is faid, was given to it by Dr Simfon, who rejoiced in the publication of a work fo well. calculated to promote the ftudy of the ancient geometry. It confilts of a feries of geometrical theorems for the moft. part new ; inveftigated firft by an analyfis, and afterwards fynthetically demonftrated by the inverfion of the fame analyfis.
Dr Stewart's conftant ufe of the geometrical analyfis had put him in poffeffion of many valuable propofitions which did not enter into the plan of any of the works that have been enumerated. Of thefe not a few:

\section*{S T I}

Stew rt have found a place in the writinge of Dr Simfon, where olickic. back.
they will for ever remain to mark the friendfhip of thefe two mathematicians, and to evince the efteem
which Dr Simfon entertained for the abilities of his pupil.

Soon after the publication of the Sun's Diffance, Dr Stewart's health began to decline, and the duties of his office became burdenfome to him. In the year 1772 he retired to the country, where he afterwards fpent the greater part of his life, and never refumed his labours in the univerfity. But though mathematics had now ceafed to be his bufinefs, they centinued to be his amufement till a very few years before his death, which happened on the 23 d of January 1785 , at the age of 68 .

The habits of ftudy, \(i_{i 1}\) a man of original genius, are objeets of curiofity, and deferve to be remembered. Concerning thofe of Dr Stewart, his writings have made it unneceffary to remark, that from his youth he had been accuftomed to the moft intenfe and continued application. In confequence of this application, adder to the natural vigour of his mind, he retained the memory of his difcoveries in a manner that will hardly be believed. He rarely wrote down any of his inveltiga. sions till it became neceffary to do fo for the purpofe of publication. When he difcovered any propofition, he would put down the enunciation with great accuracy, and on the fame piece of paper would conftruct very neatly the figure to which it referred. To thefe he trufted for recalling to his mind at any future period the demon? ration or the analyfis, however complicated st might be. Experience had taught him, that he might place this confidence in himfelf without any dan. ger of difappointment; and for this fingular power he was probably mote indebted to the activity of his invention than the mere tenacioufuefs of his memory. Tho, the was extremely ftudious, he read few books, and veri. fied the obfervation of M. D'Alembert, that of all the men of letters, mathematicians read leaf of the writings of one another. His own inveftigations occupied him fufficiently; and indeed the world would have had reafon to regret the mifapplication of his talents, had he employed in the mere acquifition of inowledge that time which he could dedicate to works of invention.

Stewart, in Scots law. See L.aw, No clviii. 5.
STEWARTIA, in botany: A genus of plants belonging to the clafs of monodelphia, and order of polyan. dria; and in the natural fyttem ranging under the 37 th order, Columniferx. The calyx is fimple; the ftyle is fimple, with a quinquefid ftigma; the apple is without juice, quinquelobed, monofpermous, burting open with a fpring five ways. There is only one fpecies, the ma. lacodendron, which is a foreign plant.

SIIBADIUM, among the Romans, a low kind of table couch or bed of a circular form, which fucceeded to the triclinia, and was of different fizes, according to the number of guefts they were defigned for. They were called bexaclina, otzaclina, or enneaclina, according as they held fix, eight, or nine guefts, and fo of any other number.

STIBIUM, a name for Antimony.
STICHOS, a name given by the old writers to a pectoral confection, the principal ingredient of which was the herb marrubium or horehound.

STICKLEBACL, in ichthyology. See Gastecostevs.

Foot-STICKS, in printing, flips of wood that lie Foor.fict between the foot of the page and the chafe, to which they are wedged faft by the quoins, to keep the form firm, in conjunction with the fide-lticks, which are placed at the fide of the page, and fixed in the fame marner by means of quoins.

STIFFLE, or great muscle, in the manege, is the part of the hind kes of a horfe which advances towards his belly. This is a moft dangerous part to receive a blow upon.

S'IIGMA, a brand or impreffion with a hot iron; a mark of infamy. See Stigmatizing.

Stigma, in botany, the fummit or top of the ftyle, accounted by the fexualits the female organ of generation in plants, which receives the fecundating duft of the tops of the ftamina, and tranfmits its vapour or effluvia through the fyle into the heart of the feed-bud, for the purpofe of impregnating the fecds.

STICMATA, in natural hiftory, the apertures in different parts of the bodies of infects coinmunicating with the trachex or air-veffels, and ferving for the office of refpiration.

Srigmata, in antiquity, certain marks impreffed on the left fhoulders of the foldiers when lifted.

Stigmata, wete alfo a kind of notes or abbreviations, confifting only of points, difpofed various ways; as in triangles, fquares, croffes, sc.

Stigmata, is alfo a term introduced by the Francifcans, to exprefs the marks or prints of our Saviour's wounds, faid to have been miraculoully impreffed by. him on the body of their feraphic father St Francis.

STIGMATIZING, among the ancients, was inflifted upon flaves as a punifhment, but more frequently as a mark to know them by: in which cafe, it was done by applying a red-hot iron marked with certain letters to their fore-heads, till a fair impreffion was made; and then pouring ink into their furrows, that the infrription might be the more confpicuous.

Soldiers were branded in the hand with the name or character of their general.

After the fame manner, it was cuftomary to ftigmatize the worfhippers and votaries of fome of the gods. The ma•ks ufed on thefe occafions were varions; fometimes they contained the name of the god, fometimes his particular enfign, as the thunderbolt of Jupiter, the trident of Neptune, the ivy of Bacchus, \&c. or they marked themielves with fome myftical number, whereby the god's name was defcribed. To thefe threc ways of ftigmatizing St John is fuppofed to refer (Rev. chap. xiii. ver. \(16,17\).\() . Theodoret is of opinion, that the\) Jews were forbidden to brand themfelves with ftigmata, becaufe the idolaters, by that ceremuny, ufed to confecrate themfelves to their falfe gods.

Among fome nations, ftigmatizing was confidered as a ciftinguifhing mark of honour and nobility. In Thrace, as Herodotus tells us *, it was practifed by none * Lib. v. but perfons of credit, nor omitted by any but perfons of the meaneft rank. The ancient Britons are alfo faid to have imprinted on the bodies of their infants the figures of animals, and other marks, with hot irons.

STIL de grain, in the colour trade, the name of a compolition ufed for painting in oil or water, and is made of a decoction of the lycium or Avignon berry, in alum-water, which is mixed with whiting into a pafte, and formed into twifted fticks. It ought to be

\section*{S T I [ 799 ] S T I}
chofen of a fine gold yellow, very fine, tender, and friable, and free from dirt.

STILAGO, in botany ; a genus of plants belonging to the clafs of gynandia, and order of triandria. There is one female. The calyx is nonophyllous, and almoft three-lobed. There is no corolla, and the berry is globular. There is only one fpecies, the bunius.

STILBE, in botany; a genus of plants belonging to the clafs of po'ygamia, and order of diaccia. The exterior calyx of the hermaphrodite flower is triphyllous; the interior is quinquedentate and cartilaginous. The corolla is funnel-flaped and quinquefid. There are four ftamina; and there is one feed in the interior calyx calyptrate. The female flower is fimilar, has no interior calyx nor fruit. There are three £pecies, the pinaftra, ericoides, and cornua, all foreign plants.

STILE. See Style.
STILL, the name of an apparatus ufed in chemiftry and in the diftillation of ardent fpirits. See Che. mistry-Index at Difillation and Still.

Stile-Buttoms, in the difillery, a name given by the traders to what remains in the ftill after working the walh into low wines. 'hefe buttoms are procured in the greateft quantity from the malt wafh, and are of fo much value to the diftiller in the fattening of hogs, \&c. that he often finds them one of the moft valuable articles of the bufinefs.

STILLINGFLEET (Edward), bifhop of Worcefter, was the fon of Samuel Stillingfleet gentleman, and was born at Cranborn in Dorfethire in 1635. He was educated at St John's College, Cambridge ; and having received holy ordere, was, in 1657 , prefented to the rectory of Sutton in Nottinghamfire. By publifining his Origines Sacri, one of the ableft defences of revealed religion that has ever been written, he foon acquired fuch reputation, that he was appointed preacher of the Rolls Chapel; and in January 1665 was prefented to the rectury of St Andrew's, Hol. born. He was afterwards chofen lecturer at the Temple, and appointed chaplain in ordinary to king Charles II. In 1668 he took the degree of doctor of divinity; and was foon after engaged in a difpute with thole of the Romifh religion, by prblifhing his difcourfe concerning the idolatry and fanaticifm of the church of Rome, which he afterwards defended againft feveral antagonifts. In 1680 he preáched at Guildhall chapel a fermon on Phil. iii. 26. which he publimed under the title of Tibe Mif,bief of Separation; and this being immediately attacked by feveral writers, he in 1683 publifhed his Unreafonablenefs of Separation. In i 685 appeared his Origines Britannica, or the Antiguities of the Britifh Chuch, in folio. During the reign of king James II. he wrote feveral tracts againft popery, and was prolocutor of the convocation, as he had likewife been under Charles II. After the Revolution he was advanced to the bifhopric of Worcefter, and was engaged in a difpute with the Socinians, and alfo with Mr Locke; in which laft contelt he is. generally thought to have been unfuccefsfnl. He died at Weftminfter in 1699 , and was interred in the cathedral of Worcefter, where a monument was erected to his memory by his fon. Dr Stillingfleet wrote other works befides thofe here mentioned, which, with the above, have been reprinted in 6 vols. folio.

Stillingeleet (Benjamin), an ingenious natura.
lift, was grandfon of the preceding. His father Ed- Stilling. ward was fellow of St John's College in Cambridoe, F. R. S. M. D. and Grefham profefior of phyfic : but marrying in 1692, he loft his lucrative offices and his father's favour; a misfortune that affected both himfelf and his pofterity. However, going into orders, he obtained, by his father's means, the living of New-ington-Butts, which he immediately exchanged for thofe of Wood-Norton and Swanton in Norfolk. He died in 1708.

Benjamin, his only fon, was educated at Norwich fchool, which he left in 1720, with the character of an excellent fcholar. He then went to Trinity-College in Cambridge, at the requeft of Dr Bentley, the mafter, who had been private tutor to his father, domeftic chaplain to his grandfather, and much indebted to the family. Here he was a candidate for a fellowfhip, but was rejected by the mafter's influence. This was a fevere and unexpected difappointment, and but little alleviated afterwards by the Doctor's apology, that it was a pity that a gentleman of Mr Stillingfleti's parts fhould be buried within the walls of a college.

Perlaps, however, this ingratitnde of Dr Bentley was not of any real differvice to Mr Stillin ffleet. Br being thrown into the world, he formed many honourable and valuable connections. He dedicated fome tranflations of Linnæus to the late lord Lyttleton, partly, he fays, from motives of private refpect and honour. Lord Barrington gave him, in a very polite manner, the place of the mafter of the barracks at Kenfingtou; a favour to which Mr Stillingfleet, in the dedication of his Calendar of Flora to that nobleman, alludes with equal politenefs, as well as with the warmeit gratitude. His Calendar of Flora was formed at Stratton in Norfoll in the year 1755, at the hofpitable feat of his very worthy and ingenious friend Mr Marfham, who had made feveral obferva. tions of that kind, and hae communicated to the public his curious obfervations on the growth of trees. But. it was to Mr Wyndham of Felbrig in Norfolk that he appears to have had the greatelt obligations : he travelled abroad with him, fpent much of his time at his houfe, and was appointed one of his executors (Mr Garrick was another), with a confiderable addition to an annuity which that gentleman had fettled upon him: in his lifetirne.

Mr Stillingfleet's genius. feem6, if we may judge from. his works, to have led him principally to the fudy of natural hifory; which he profecuted as an ingenious. philofopher, an ufeful citizen, and a good man. In this walk of learning he mentions, as his friends, Dr Watfon, Mr (afterwards Dir) Solander, Mr Hudfon \({ }_{r}\) Mr Price of Foxley, and fome others; to whom may: be added the ingenious Mr Pennant. Nor can wes omit the flattering mention which the late Mr Grays makes of him in one of his letters, dated from London in. 1751 : "I have lately made an acquaintance witl this philofopher, who lives in a.garret here in the winter, that he may fupport fome near relations who de; pend upon him. He is always employed, confequently (accolding to my old. maxim) always happy, alwaygcheerful, and feems to me a very worthy honeft man. His prefent fcheme is to fend fome perfons, properly: qualified, to refide a year or two in Artica, to make themfelves acquainted with the climate, productions,

\section*{S T I}

Stillingflets
Il
and natural hifory of the country, that we may underitand Ariftotle, Theophraftus, \&c. who have been heathen Greek to us for fo many ages ; and this he has got propofed to lord Pute, no unlikely perfon to put it in execution, as he is himfelf a botanift."

Mr Stillingleet publifhed a volume of mifcellaneous tracts, which is in much efteem, and does great honour to his head and heart. They are chiefly tranflations of fome effays in the Amenitates Academica, publifhed by Linnæus, interfperfed with fome obfervations and additions of his own. In this volume he fhows alfo a tafte for clafical learning, and entertains us with fome elegant poetical effufions of his own. But his Effay on Converfation, publifhed in the firf volume of Dodfley's Collection of Poems, entitles him to a diftinguifhed rank among our Englifh poets. This poem is addreffed to Mr Wyndham, with all that warmth of friend hhip which diftinguifhes P.fr Stillingfleet. As it is chiefly didactic, it dces not admit of fo many ornaments as fome compofitions of other kinds. However, it contains much good fenfe, fhows a confiderable knowledge of mankind, and has feveral paffages that in point of harmony and eafy verfification would not difgrace the writings of our moft admired poets. Here more than once Mr Stillingfleet fhows himfelf ftill fore for Dr Bentley's cruel treatment of lim ; and towards the beautiful and moral clofe of it (where it is fuppofed he gives us a Aketch of himfelf) feems to hint at a mortification of a more delicate nature, which he is faid to have fuffered from the other fex.

To thefe difappointments it was perhaps owing that Mr Stillingfleet ncither married nor went into orders. His London refidence was at a faddler's in Piccadilly ; where he died in 1771; aged above 70, leaving feveral valuable papers behind him. He was buried in St James's church, without the nighteft monument of his having exitted.

STILLINGIA, in botany ; a genus of plants belouging to the clafs of monacia, and to the order of monodelphia. The male calyx is hemifpherical and multiflorous. The corolla is tubulous, and erofe or gnawed. The female calyx is uniflorous and inferior. The corolla is fuperior. The ftyle is trifid, and the capfule three-grained. There is only one fpecics, the fylvatica.

STILYARD. See SqEFL- Yard.
STILPO, a celebrated philofopher of Megara, flourifhed under the reign of Ptolemy Euergetes. In his youth he had been addiEted to licentious pleafures, from which he religiounly refrained from the moment that he ranked himfelf among philofophers. When Ptolemy Soter, at the taking of Megara, offered him a large fum of money, and requefted that he would accompany him into Egypt, he accepted but a fmall part of the offer, and retired to the ifland of Egina, whence, on Ptole. my's departure, he returned to Aserara. That city being again taken by Demetrius the fon of Antigonus, and the philofopher required to give an account of any effects which he had loft during the hurry of the plunder, he replied, that he had loft nothing; for no one could take from him his learning and eloquence. So great was the fame of Stilpo, that the moft eminent philofophers of Athens took pleafure in attending upon his difcourfes. His peculiar doctrines were, that fpe-cies-or univerfals have no real exiftence, and that one

\section*{800 ] S.T I}
thing cannot be predicated of another. With refpect Stiloharan to the former of thefe opinions, he feems to have taurgh the fame doctrine with the fect afterwards known by the appellation of Nominalif/s. To prove that one thing cannot be predicated of another, he faid, that goodne/s and man, for inftance, are different things, which cannot be confounded by afferting the one to be the other : he argued farther, that goodnefs is an univerfal, and univerfals have no real exiftence; confequently, fince nothing cannot be predicated of any thing, good.. nefs cannot be predicated of man. Thus, whillt this Bnficld 's fubtle logician was, through his whole argument, pre Hiflory of dicating one thing of another, he denied that any one thing could be the accident or predicate of another. If Stilpo was ferious in this reafoning; if he meant any thing more than to expofe the fophiftry of the fchools, he muft be confeffed to have been an eminent mafter of the art of wrangling; and it was not wholly without reafon that Glycera, a celebrated courtezan, when the was reproved by him as a corrupter of youth, replied, that the charge misht be juitly retorted upon himfelf, who fpent his time in filling their heads with fophiftical quibbles and ufelefs fubtleties.' In ethics he feems to have been a Stoic, and in religion he had a public and a private doctrine, the former for the multitude, and the latter for his friends. He admitted the exiftence of a fupreme divinity, but had no reverence for the Grecian fuperftitions.

STILOBATUM, in architecture, cenotes the body of the pedeftal of any column. -

STILTON, a town of England, in the county of Huntingdonfhire, 75 miles from London, fouth-weft of Yaxley, on the Roman highway from Caftor to Huntingdon, called Ermine-greet, fome parts of which, in this neighbourhood, appear ftill paved with ftone. This place is famous for cheefe which is called Englifo Parmefan, and is brought to table full of mites or majrgots. For making Stilton cheefe, we have the following receipt in the firft volume of the Repofitory of Arts and Manufactures:
" Take the night's cream, and put it to the morning's new milk, with the renuet; when the curd is come, it is not to be broken, as is done with other cheefes, but take it out with a foil-difh altogether, and place it in a fieve to drain gradually; and as it drains, keep gradually preffing it till it becomes firm and dry; then place it in a wooden hoop; afterwards to be kept dry on boards, turned frequently, with cloth binders round it, which are to be tightened as occafion requires, and changed every day until the cheefe become firm enough to fupport itfelf; after the cloth is taken off, the cheefe is rubbed every day all over, for two or thrce months, with a brufh; and if the weather be damp or moift twice a.day; and even before the cloth is taken off, the top and bottom are well rubbed every day."

STIMULANTS, in medicine, fubftances which increafe the action of certain parts of the body. In particular, they quicken the motion of the blood, increafe the action of the mufcular fibres, and affect the nervous fyltem.

STIMULI, in botany ; a fpecies of armature or offenfive weapon, with which fome plants, as nettle, caffada, acalypha, and tragia, are furnifhed. Their ufe, fays Linnzus, is by their venomous punctures to keep

\section*{S T I [ 801 ] S T I} them.

STING, an apparatus in the bodies of certain infects, in form of a little fpear, ferving them as a weapon of offence.

Sting-Ray, in ichthyology. See Raia.
STINK-por, an earthen jar or thell, clarged with powder, grenadoes, and other materials of an oflenfive and fuffocating fmell. It is frequently' ufed by privateers, in the weffern ocean, in the attack of an enemy whom he defigns to board; for which purpofe it is furnifhed with a light fufe at the opening or touch-hole. Sce Boarding.

STINT, a feccies of the Tringa.
STIPA, Feather Grass, in botany: A genus of plants belonging to the clafs of triandria, and order of digynia; and in the natural fyftem ranging under the ath order, Gramina. The calyx is bivalved. The exterior valve of the corolla is terminated by an awn; the bale is jointed.

There are nine fpecies, the penata, juncea, capillata, ariftella, tenaciffima, avenacea, membranacea, arguens, and fpicata. Of thefe one only is Britifh, the pennuta or common feather grafs. 'The beards are feathered. The plant rifes to the height of 10 inches, gruws on mountains, and flowers in July or Auguft.

STIPEND, among the Romans, fignifies the fame with tribute ; and hence fipendarii were the fame with sributarii.

Stipend, in Scots law. See Law, §clix. 12.
SIIPULA, in botany, one of the fulcra or props of plants, defired by Linnxus to be a fcale, or fmall leaf, thationed on each fide the bafe of the foottalks of the tower and leaves, at their firlt appearance, for the purpofe of fupport. Elmgren refricts it to the footitalks of the leaves only.

STIPULATION, in the civil law, the act of fipulating, that is, of treating and concluding terms and conditions to be inferted in a contract. Stipulations were anciently jerformed at Rome, with abundance of ceremonies ; the firlt whereof was, that one party fhould interrogate, and the other anfwer, to give his confent, and oblige himfelf. By the ancient Ro. mari law, nobody could ftipulate but for himfelf; but as the Tabelliones were public fervants, they were allowed to ftipulate for their matters; and the notaries fucceeding the Tabelliones have inherited the fame privilege.

ST'IRIA, a province of Germany, in the circle of Aultria, with the title of a duchy., It is bounded on the north by the anchduchy of Auftria, on the ealt by Hungaly, on the fouth by Carnola, and on the weit by Carinthia and the archbifhopric of Saltßurg ; being 325 miles in length and 17 in breadth. It is faid to contain 22 cities, 95 towns, \(33^{8}\) caftles, 15 convents, and 200,000 inhatritants. 'Though it is a mountainous country, et there is a great deal of land fit for tillage, and the foil is fo-good, that the inluabitants never were in want of corn. It contains mines of very good iron ; whence the arms made there are in great efteen. The women differ greatly from the Auftrians, and are very plain and dowuright. They have all fwellings on their throats, called bronchoceles. 'The men are alio very trmple, and are very zealous workippers of the Virgin

Vot. XVII. Part II.

Mary, They delight to fit at home in the chimney
Stirlint. corner, never troubling their heads about foreisn affairs. The chief town is Gratz.

STIRLING, a town of Scotland, fituated on the river Forth, 35 miles north-weft of Edinburgh, in W. Lonr. 3. 59. N. Lat. 56. 6. It is alfo called Sterling and Striveling; from the former of which Boe. thius falfely derives the name Sterling money; becaufe, fays he, Ofbeit, a Saxon prince, after the overthrow of the Scots, eftablifhed a mint there. The name of Striveling is faid to have been derived from the frequency of ftrifes or conflicts in the neighbourhood. The town contains about 4000 inhabitante. It has a manufacture of tartans and fnalloons, and employs about 30 looms in that of carpets. The great ftreet is very broad. In it is the tolbooth, where is kept the ftandard for the wet meafures of Scotland. The other ftreets are narrow and irregular. - Stirling is in miniatnre a refemblance of Edinburgh; being built on a rock of the fame form, with a fortrels on the fummit. 'I'he origin of the caftle is unknown. The rock of Stirling was ftrongly fortified by the Picts, amongf whom ar* chitecture and feveral other ufeful arts had made a confiderable progrefs. As it lay in the extremities of their kingdom, the poffeffion of it was the occafion of frequent contefts betwixt them and their neighbours the Scots and Northumbrians; each of whofe dominions did, for fome time, terminate near it.

When the Scots, under Kenneth II. overthrew the Pictif empire near the mildle of the ninth century, they endeavoured to obliterate every memorial of that, people. They not only gave new names to provinces and towns, but, with all the rayse of barbarians, demolifhed many marnificent and ufeful edifices which had been reared up by them, and this fortrefo among the reft. It was, however, foon rebuilt, though upon an eccafion not very honourable to the Scets.

Upon the death of Kenneth I1. in 855, his brother Donald V. mounted the throne of Scotland. In the beginning of his reign the kingdom was invaded by Ofbrecht and Ella, two Northumbrian princes, who, uniting their forces with the Cumbrian Britons, and a nunber of Piets, who upon their expulfion from their native country had taken refuge in England, advanced to Jedburgh, where Donald encountered them ; and, after a fierce and bloody battle, obtained a complete victory : but, having taken up his flation in Berwick, in fupine fecurity, the Northumbrians, informed of the carelefs pofture in which the Scottifh army lay, furprifed them by a hafty march, difperfed them, and made a prifoner of the king. Purfuing the advantage they had gained, they marclied northward, and fubdued all before them to the Frith of Forth and the town of Stirling. But the forlorn fituation of the Scots, without a king and without an army, obliging them to fue for peace, they obtained it, upon condition that they fhould pay a fum of money for the ranfom of the king, and yield up all their dominions upon the fouth fide of the Forth to the conquerors.

The Northumbrians taking poffeffion of the territories ceded to them by this ireaty, rebuilt the cafle of Stirling, and planted it with a ftrong garrifon, in order to preferve their new conquefts, upon the frontiers of which it was fituated. Our authorities alfo inform
us, that they erected a fone bridge over the Forth, upon the fummit of which a crofs was raifed, with the following infcription in monkifh thyme.

> Anglos a Scotis fiparat crux ifla remotis; Armis bic fant Bruti, Scoti flant bic, cruce tuti.

\section*{Which is thus tranfated by Bellenden.}

\section*{I am free marche, as paffengeris may ken, \\ To Scottis, to Britonis, and to Inglifmen.}

None of the ancient Englifh hiftorians mention this conqueft. The whole ftory, as well as the infcription, wears much of a monkiin garb; yet its authenticity is not a little confirmed by the arms of the town of Stirling, upon which is a bridge, with a crofs, and the laft line of the above Latin diftich is the motto round it.

We muft not, however, imagine, that in thofe times that fortrefs bore any refemblance to the prefent fructure, which is adapted to the ufe of fire-arms. Its fize and form probably refembled thofe caftles which, under the feudal conftitution, the Englifh and Scottifh barons ufed to erect upon their eftates for dwellinghoufes; and which, in thofe barbarous ages, they found neceffary to fortify for their defence, not only againft foreign invaders, but often againft the attacks of their own neighbours. It is directly fuch a Gothic figure as this which reprefents the Caftrum Strivelenfe upon the arms of Stirling.

This fortrefs, after it had continued in the poffeffion of the Northumbrian Saxons about 20 years, was, together with the whole country upon the fouth fide of the Forth, reftored to the Scots, upon condition of their affifing the Saxons againft their turbulent invaders the Danes. Upon the arms of Stirling are two branches of a tree, to reprefent the Nemus Sirivelenfe; but the fituation and boundaries of that foreft, which was probably a wing of the Caledonian, cannot be afcertained. Upori the fouth of Stirling, veftiges of a foreft are fill difcernible for feveral miles. Banks of natural timber fill remain in the caflle park, at Murray's wood, and near Nether Bannockburn; and Aumps of trees, with much brufhwood, are to be feen in all the acjacent fields.

When Kenneth III. received intelligence of the Danes having invaded his dominions, he appointed the cafle of Stirlings to be the place of rendezvous for his army ; and he marched from thence to the battle of Loncarty, where he obtained a victory over thofe rovers, in the end of the 1oth century.

In the 12 th century, this caftle is fpoken of as a place of great importance, and one of the Rrongeft fortreffes in the kingdom. In 1174, a calamity, not unufual amongtt the Scottifh monarchs, befel William, who at that time occupied the throne. He was taken prifoner in an unfuccefsful expedition which he made into England; and, after having been detained 12 months in captivity, was releafed, upon ftipulating to pay a large fum of money for his ranfom; and, until payment thereof, delivering into the hands of the Englifh the four principal fortreffes in the kingdom, which in thofe days were Stirling, Edinburgh, Roxburgh, and Berwick. This was the firt great afcendant that England obtained over Scotland ; and indeed the molt important tranfaction which had paffed between thefe kingdoms from the Norman conqueft.

Though the Scottifh monarchs, in their frequent per. Stirling ambulations through the kingdom, often vifited Stirling, and held their courts for fome time in the cafle; yet it did not become a royal refidence till the family of Stuart mounted the throne, and it was from different princes of this family that it received its prefent form. It was the place of the nativity of James II.; and, when raifed to the throne, he frequently kept his court in it. It is well known to have been the place where that prince perpetrated an atrocious deed, the murder of William earl of Douglas, whom he ftabbed with his own hand. The royal apartments were at that time in the north. weft corner of the caftle, and are now the refidence of the fort-major. The room where the murder was committed Aill goes by the name of Douglas's room. See Scotland, \({ }^{\circ} 304,305\).

James III. contracting a fondnefs for the caftle on account of its pleafant fituation, made it the chief place of his refidence, and added feveral embellifhments to it. He built within it a magnificent hall, which in thofe days was deemed a noble ftructure, and is ftill entire. It now goes by the name of the parliament-boufe, having been defigned for the accommodation of that fupreme court. It was covered with an oaken roof of exquifite workmanfhip, which, though very little decayed, was a few years ago removed to make way for one of more modern ftructure. James alfo erected a college of fecular priefts in the caftle, which he called the chapelroyal, and which proved one caufe of his own ruin. As the expences neceffary for maintaining the numerous officers of fuch an inftitution were confiderable, he annexed to it the revenues of the rich priory of Coldingham in the Merfe, which at that time happened to become vacant. This priory had for a long time been holden by perfons connected with the family of Hume; and that family, confidering it as belonging to them, ftrongly oppofed the annexation. 'The difpute feems to have lafted feveral years; for one parliament had paffed a vote, annexing the priory to the chapel-royal, and a fubfequent one enacted a ftatute prohibiting every attempt that was contrary or prejudicial to that annexation.

James V. was crowned in the caftle of Stirling ; and the palace, which is the chief ornament of it, was the work of that prince. This is a ftately and commodious fructure, all of hewn ftone, with much flatuary work upon it. It is built in form of a fquare, with a fmall court in the middle, in which the king's lions are faid to have been kept; and hence it flill goes by the name of the lions den. The palace contains many large and eleyant apartments; the ground-fory is now converted into barrack-rooms for the foldiers of the garrifon ; the upper affords a houfe for the governor, with lodgings for come of the fubaltern officers.
Oppofite to the palace, upon the north, ftands an elegant chapel, which was built by James VI. for the baptifm of his fon prince Henry in 1594. In this chapel is preferved the hulk of a large boat, which that whimfical monarch caufed to be built and placed upon carriages, in order to convey into the caftle the provifions for that folemnity.

A ftrong battery, with a tier of guns pointing to the bridge over the Forth, was erected during the regency of May of I.orraine, mother to queen Mary. It is called the French battery, probably becaufe conftructed by engineers of that nation. The laft addition was made

\section*{S T I}
[803 ]
S T O
irling, to the fortifications in the reign of queen Anne. For-tirhnghire. merly they reached no farther than the old gate, upon which the flag-ftaff now flands : but in that reign they were confiderably enlarged upon the fide towards the town ; and barracks, which are bomb proof, with feveral other conveniences for a fiege, were erected.

Upon the fouth fide of the cattle lies a park inclofed with a ftone-wall, called the king's park, and near to the foot of the rock on which the caftle ftands, lay the royal gardens; veltiges of the walks and parterres, with a few ftumps of fruit-trees, are fill vifible; but by long neglect, and the natural wetnefs of the foil, the place is now little better than a marfh. In the gardens is a mount of earth in form of a table, with benches of earth around it, where, according to tradition, the court fometimes held fetesechampetres. In the caftlehill is an hollow, comprehending about an acre of ground, and having all the appearance of an artificial work, which was ufed for joufts, tournaments, and other feats of chivalry.

Northward of the caftle lies the Govan, or perhaps more properly the Goruling hill (A) ; in the middle of which is a fmall mount called Hurly Haaky, upon which. duke Murdoch and his two fons were executed for treafonable practices in the reign of James I.

The profpect from the caftle is moft delightful, as well as extenfive, being greatly beautified, efpecially upon the eaft, by the windings of the Forth; which are fo many, that though the diftance by land from Stirling to Alloa is, in a ftraight line, not quite fix miles, it is faid to be 24 by water. As this river generally runs upon plain ground, it rolls its ftream in fo now and filent a manner, that what Silius Italicus faith of the Ticinus is applicable to it, if, inftead of lucenti in that poet, we fhould for once read lutofo; for the claybanks, together with the tide, which flows above Stirling, render the Forth perpetually muddy :

\section*{\(V i x\) credas labi, ripis tam mitis opacis Somniferam ducit lutofo gurgite lympham.}

The lordfhip and caftle of Stirling were a part of the ufual dowry of the queens of Scotland, at leatt after the family of Stuart came to the throne, in which they were invefted at their marriage.

Robert lord Eifkine was appointed governor of the caftle by king David II. and the office continued in that family till 1715 .

This fortrefs hath been the fcene of many tranfactions. Being by its fituation confidered as a key to the northern parts of the kingdom, the poffeffion of it hath been always efteemed of great importance to thofe who fought to be mafters of Scotland. It was undoubtedly a place of ftrength when the art of war by ordnance was in its infancy; but though it refifted the utmoft ef. forts of the rebels in 746 , it could not now hold out three days if befieged by an army of a few thoufand men conducted by an engineer of knowledge and integrity.

STIRLINGSHIRE, a county of Scotland, of which Stirling is the capital. It extends 25 miles in length and 12 in breadth; being bounded on the weft
by part of Lennox and Clydefdale; on the eaft, by Clackmannanihire, the river Forth, and part of Lothian; on the fouth-eaft, by Lothian; and on the north, by Monteith. The face of the country is open and agreeable, diverfified by hill and dale, well watered with ftreams and rivers ; the principal of which is the Forth, rifing in the neighbourhood of a high mountain called Ben-Lomond, and, running ealtward, forms the frith of Edinburgh. The fouthern part is hilly, affording plenty of game, and pafturage for fheep, horfes, and black cattle. The eaftern part is fertile, producing plentiful harvefts of corn, and great abundance of coal. Lead-ore is found in different parts of the fhire; and the rivers abound with pike, trout, and falmon.

STIRRUP; in the manege, a reft or fupport for the horfeman's foot, for enabling him to mount and for keeping him firm in his feat.

Stirrups were unknown to the ancients. . The want of them in getting upon horfeback was fupplied by agility or art. Some horfes were taught to ftoop to take their riders up; but the riders often leapt up by the help of their fpears, or were affifted by their flaves, or made ufe of ladders for the purpofe. Gracchus filled the highways with ftones, which were intended to anfwer the fame end. 'I'he fame was alfo required of the furveyors of the roads in Creece as part of their duty.

Menage obferves, that St Jerome is the firt author who mentions them. But the paffage alluded to is not to be found in his cpittes; and if it were there, it would prove nothing, becaule St Jerome lived at a time when ftirrups are fuppofed to have been invented, and after the ufe of faddles. Montfaucon denies the authenticity of this paffage ; and, in order to account for the ignorance of the ancients with regard to an inftrument fo ufeful and fo eafy of invention, he obferves, that while Hiffory and cloths and houfings only were laid upon the horfes backs, Hor of emunon which the riders were to fit, firrups could not have \({ }^{\text {/bit }}\), vol. \(\mathrm{i}_{\text {. }}\) been ufed, becaufe they could not have been faltened \(p\) with the fame fecurity as upon a faddle. But it is more probable, that in this inftance, as in many others, the progrefs of human genius and invention is uncertain and flow, depending frequently upon accidental caufes.

Stirrup of a Ship, a piece of timber put upon a fhip's keel, when fome of her keel happens to be beaten off, and they cannot come conveniently to put or fit in a new piece; then they patch in a piece of timber, and bind it on with an iron, which goes under the fhip's keel, and comes up on each fide of the fhip, where it is nailed Atrongly with fpikes; and this they call a ftirrup.

STOB EUS (John), a laborious Greck writer, who lived at the end of the fourth century, compofed many works, of which there are only his Collections remainin 5 , and even thefe are not as he compofed them; many things being inferted by later authors. This work contains many important fentiments collected from the ancient writers, poets, and philofophers.

STOCK, in gardening, \&c. the ftem or trunk of a tree. What ftock is moft proper for each kind of fruit, ourht as well to be confidered and known, as what loil 5 I 2

SlOCKHOLM , the capital of Sweden, is fituated in the province of Upland, in E. Long. :9. 30. and N. Lat. 59. 20. Its foundation is by the beft Swedifh writers generally attributed to Birger Jarl, regent of the kingdom about the middle of the 13 th century du. ring the minority of his fon Waldemar, who had been raifed to the throne by the fates of the kingdom; but it was not before the laft century that the royal refidence was transferred from Uplala to this city.
'This capital, which is very long and irregular, occupies, befide two peninfulas, feven fmall rocky iflands, ficattered in the Mreler, in the ftreams which iffue from that lake, and in a bay of the gulf of Bothnia. A varicty of contrafted and enchanting views are formed by numberlefs rocks of granite riling boldly from the furface of the water, partly bare and craggy, partly dotted with houles, or feathered with wood. I he harbour is an inlet of the Baltic: the water is clear as cryftal, and of fuch depth that fhips of the largeft burthen can approach the quay, which is of confiderable breadth, and lined with fpacious bnildings and ware-houfes. At the extremity of the harbour feveral ftreets rife one above another in the form of an amphitheatre; and the palace, a magnificent building, crowns the fummir. Towards the fea, about two or three miles from the town, the harbour is contracted into a narrow itrait, and, winding among high rocks, difappears from the fight; and the profpect is terminated by diftant hills, overfpread with foreft. It is far beyond the power of words, or of the pencil, to delineate thefe fingular views. The central ifland, from which the city derives its name, and the Kitterholm, are the handfomett parts of the town. Excepting in the fuburbs, where the houles are of wood painted red, the generality of the buildings are of ftone, or brick ftuccoed white. The royal palace, which ftands in the centre of Stockholm, and upon the higheft fpot of ground, was begun by Charles XI.: it is a large quadrangular ftone edifice, and the ftyle of architecture is both elegant and magnificent.

It is the habitation not only of the royal family, but allo of the greater part of the officers belonging to the houtehold. It likewife comprehends the national or fupreme court of juftice, the colleges of war, chancery, treafury, and commerce; a chapel, armoury, library, and office for the public records; but the greater number of inferior officers and fervants belonging to the court, are, with the foot guards, quartered on the burghers. The caftle, and all the flately edifices in the kingdom, are covered with copper. The palace of the nobility, in which this order fits during the feffion
of the diet, is an elegant buildiny adorned on the out- Stockholo fide with marble ftatues and columns, and on the infde stocking with pairting and fculpture. This and three nther palaces ftand on the banks of the lake, and are built on the fame model, fo as to compofe an uniform piece of architecture. The bank, built at the expence of the city, is a noble edifice, and joins with many fumptuous houfes belonging to the nobility in exhibiting a fplendid appearance. 'The houfes of the burghers are generally buitt of brick in the city; but in the fuburbs they are commonly made up of timber, and therefore very fubject to conflas rations. Thefe houfes are often framed in Finland, according to the plan and dimentiona preferibed : whence they are tranfported in pieces to Stockholm by water, and there fet up by the carpenters. Thefe wooden habitations, if kept in proper repair, w 11 laft \(3 \circ\) or 40 years, and are deemed warmer, neater, and more healthy, than thofe of brick or ftone. 'To prevent the danger of conflagrations, the city is divided into 12 wards. In each of thefe there is a matter and four affiftants, who forthwith repair to the place where the fire breaks out; and all parters and labourers are obligeci to tange themfelves under the malter of the ward to which they belong. A fire-watch patroles the ftreets by night, to give warning or affiftance as it may be wanted; and a centinel is maintained in the fteeple o! every church, to toll the bell on the firft appearance of any fuch accident. The police of Stockholm is entirely fubjected to the regulations of the grand governor, affitted by a deputy and bailife of the caftle. This city is the ftaple of Sweden, to which all the commodities of the kingdom are bronght for exportation, and where almoft all the imports from abroad are depofited. The port or haven formed by the lake Mxeler is large enough \(t\) ( \(*\) contain 1000 fail of fhipping; and furnifhed with a key or wharf about an Englifh mile in length, to which the veffels nay lie with their broadfides. The greateft inconveniences attending this lituation are, the diftance from the fea, which is not within lefs than 10 miles of the town; the want of tides; and the winding of the river, which is remarkably crooked. It opens into the Baltic; and the entrances, which is dangerous and rocky, the Swedes have fecured with two fmall forts: within, it is perfectly fafe and commodious. The northern fuburbs are remarkable for the king's gardens, and for the great number of artifans who have chofen their habitations in this quarter. In the fouthern fuburbs the Mufcovite commodities are fold; and here is a magnificent exchange where the merchants daily affemble.
STOCKING, that part of the clothing of the leg. and foot which immediately covers and fereens them from the rigour of the cold. Anciently, the only ftockings in ufe were made of cloth, or of milled fuffs fewed together; but fince the invention of knitting and weaving flockings of filk, wool, cotton, thread, \&c. the ufe of cloth ftockings is quite difcontinued. Dr Howel, in his Hiftory of the World (vol. ii. p. 222.) relates, that queen Elizabeth, in 1501 , was prefented with a pair of black knit filk ftockings by her filk-woman, and thenceforth the never wore cloth ones any more. The fame author adds, that king lienry VIII. ordinarily wore cloth hofe, except there came from Spain, by great chance, a pair of filk ftockings. His fon, king Edward VI. was prefented with a pair of long Spanifh filk fockings by Sir Thomas Grefham,

\section*{S T O}

\section*{\(805]\)}

S T O
neking, and the prefent was then much taken notice of. Hence Bracks. it fhould feem, that the invention of knit filk ftockings originally came from Spain. Others relate, that oue William Rider, an apprentice on London bridge, feeing at the houfe of an Italian merchant a pair of knit worted flockings from Mantua, took the hint, and made a pair exactly like them, which he prefented to William earl of Pembroke, and that they were the firt of that kind worn in Encland, anno 1564.
'The modern ftockings, whether woven or knit, are formed of an infnite number of little knots, called jitches, loops, or mefhes, intermingled in one another.
Knit fockings are wrought with needles made of polifhed iron, or brafs wire, which interweave the threads and form the mefhes the ftocking confifts of. At what time the art of knitting was invented it is perthaps impofible to deternine, though it las been ufually attributed to the Scots, as it is faid that the firft works of this kind came from Scotland. It is added, that it was on this account that the company of Alocking-knitters, etablifhed at Paris \({ }^{1527}\), took for their patron St Fiacre, who is faid to have been the fon of a king of Scotland. But it is mof probable that the method of knitting ftockings by wires or needles was firt brought from Spain.

Woven ftockings are generally very fine; they are manufactured on a frame or machine made of polifhed iron, the ftructure of which it is needlefs to defcribe, as it may be feen in almolt every confiderable town in Great Britain. The invention of this machine is, by Mr Anderfon, attributed to Willian Lee, M. A. of Sit John's College, Cambridge, at a period fo early as 1589. Others have given the credit of this invention to a ftudent of Oxford at a much later period, who, it is laid by A aton Hill*, was driven to it by dire neceffi-
cr's daughter, married her though the had not a penny, and he by his marriage loft a fellowflhip. They foon fell into extreme poverty ; and their marriage produ. cing the confequences naturaily to be expected from it, the amorous pair became miferable, not fo much on account of their fufferings, as from the melancholy dread of what would become of their yet unborn infant. Their ouly meaus of fupport were the knitting of flockings, at which the woman was very expert: "But fitting conflantly together from morning to night, and the fcholar often fixing his eyes, with ttedfaft obfervation, on the motion of his wife's finger's in the dexterous management of her needles, he took it into his imarination, tha: it was not impofible to contrive a little loom which might do the work with much more expedition. 'I'his thought he communicated to his wife, and joining his head to her hands, the endeavour fucceeded to their wifh. Thus the ingenious ftockingloom, which is fo common now, was firt invented; by which he did not only make himfelf and his tamily happy, but has left his nation indebted to him for a benefit which enables us to export filk flockings in great quantities, and to a valt advanta e, to thole very countries from whence before we ufed to bring them at confiderable lofs in the balance of our traffic.,'

STOCKS, or Public Funds in England. By the word flock was originally meant a particular fum of money contributed to the eftablifhing of a fund to enable
a company to carry on a certain trade, by means of strock, which the perfon became a partner in that trade, and received a flare of the profit made theleby, in proportion to the money employed. But this term has been extended farther, though improperly, to fignify any fum of meney which has been lent to the government, on condition of receiving a certain interelt till the money is repaid, and which makes a part of the national debt. As the fecurity both of the government and of the public companies is efteemed preferable to that of any private perion, as the focks are negotiable and may be fold at any time, and as the intereft is always punctually paid when due; fo they are thereby enabled toborrow money on a lower intereft than what could be obtained from lending it to private peifons, where there mult be always fome danger of lofing both principal and intereft.
But as every capital fock or fund of a company is raifed for a particular purpofe, and limited by parliament to a certain fum, it neceffarily follows, that when that fund is completed, no fluck can be bought of thecompany; though flares already purclafed may be tiansferred from one perfon to another. 'This being the cafe, there is frequently a great difproportion betwece the original value of the fhares and what is given for them when transferred: tor if there are more buyera than felless, a perfon who is indifferent about felling will not part with his thare without a confiderable profit to himfelf; and on the contrary, if many are difpofed to fell, and few inclined to buy, the value of fuch thares will naturally fall in proportion to the impatience of thofe who want to turn their flock into fpecie.

A flock may likewife be affected by the court of chancery; for if that court fhould order the money, which is under their direction, to be laid out in any. particular flock, that ftock, by having more purchateris, will be raifed to a higher price than any other of the like value.

By what has been faid, the reader will perceive how much the credit and intereft of the nation depends on the fupport of the public funds. While the annuities and interelt for money advanced is there regularly paid, and the principal infured by both prince and people (a fecurity not to be had in other nations), foreigners will lend us their property, and all Europe be iuterefted in our welfare ; the paper of the companies will be converted into money and merchandife, and Great Britain can never want. cafh to carry her fchemes into execution. See the article Fund.

Stocks, a frame erected on the fhore of a river or harbour, whereon to build fhipoing. It generally confirts of a number of wooden blocks, ranked parailel to each other, at convenient dittances, and with a gradual declivity towards the water.

Srocks, a wooden machine to put the legs of offenders in, for fecuring diforderly perfons, and by way of punifhment in divers cafea, ordained by ftatute, \& c.
STOCKTON upon Tees, a handiome town in the county of Durham, about 16 miles fouth of the city of Durhain. It is now a port of confiderable trade; though, at the Refloration, it was a defpicable village, the beft houfe in which could hardly boaft of any thing better than clay-walls and a thatched roof.

About:

About 40 years ago it fent out in one year 75 veffels for the port of London; and the tiade is much increa. fed fince.
STOEBE, bastardethiopian, in botany: A genus of plants belonging to the clafs of fyngenefia, and order of polygamia fegregata; and in the natural fyltem ranging under the 49 th order, compnfite. The calycle is uniforous; the corollets are tubular and hermaphrodite ; the receptacle is naked, and the pappus is feathery. There are nine fpecies, the æthiopica, ericoides, proftrata, gnaphaloides, gomphrenoices, fcabra, reflexa, rhinocerotis, and difticha; all plants of foreign growth.

S FOICS, the name given to a fect of Grecian philofophers, from \(\Sigma_{\text {rood }}\) " "the porch in Athens," which the founder of the fect chofe for his fchool. For the peculiar tenets of thisfect, fee Metraphysics, Chap. IV. Part 3. Moral Philosophy, no 8. and Zeno.

STOLBERG, a fmall town of Germany, in the circle of Upper Saxony, and territory of Thuringia, of which it is the capital place. It is feated between two mountains, 58 miles north-weft of Leipfic. E. Long. 11. 8. N. Lat. 5 1. 42.

STOLE, a facerdotal ornament worn by the Romifh parifh-priefts above their furplice, as a mark of fuperiority in their refpective churches; and by other priefts over the alb, at celebrating of mafs, in which cafe it goes acrofs the fomach; and by deacons, over the left-fhoulder, fcarf-wife: when the priclt reads the gofpel for any one, he lays the bottom of his ftole on his head. The ftole is a broad fwath, or hip of fuff, hanging from the neck to the feet, with three croffes thereor.

Groom of the Stole, the eldeft gentleman of his Majefty's bed-chamber, whofe office it is to prefent and put on his majefty's firft garment, or fhirt, every morning, and to order the things in the chamber.

STOMACH, in anatomy. See \(A_{\text {natomy, }}{ }^{\circ} 9\) r.
STOMACHIC, medicines that Arengthen the ftomach and promote digeftion, \&c.

Stomachic corroboratives are fuch as ftrengthen the tone of the ftomach and inteftines; among which are carminatives, as the roots of galaugals, red gentian, zedoary, pimpinella, calamus aromaticus, and arum. Of barks and rinds, thofe of canella alba, faffafras, citrons, Seville and China oranges, \&c. Of fpices, pepper, ginger, cloves, cinnamon, cardamums, and mace.

STONE (Edmund), a diftinguifhed felf-taught mathematician, was born in Scotland; but neither the place nor time of his tirth are well known; nor have we any memoirs of his life, except a letter from the Chevalier de Ramfay, author of the 'Travels of Cyrus, in a letter to father Caftel, a Jefuit at Paris, and publifhed in the Memoirs de 'Trevoux, p. 109, as follows: "True genius overcomes all the difadvantages of birth, fortune, and education; of which Mr Stone is a rare example. Born a fon of a gardener of the duke of Argyle, he arrived at eight years of age before he learnt to read.By chance a fervant having taught young Stone the letters of the alphabet, there needed nothing more to difcover and expand his genius. He applied himfelf to ftudy, and he arrived at the knowledge of the moft fublime geometry and analyfis, without a mafter, with-
genius.
"At 18 years of age he had made thefe confiderable advances without being known, and without knowing himfelf the prodigies of his acquifitions. The duke of Argyle, who joined to his military talents a general knowledge of every fcience that adorns the mind of a man of his rank, walking one day in his garden, faw lying on the grafs a Latin copy of Sir Ifaac Newton's celebrated Principia. He called fome one to him to take and carry it back to his library. Our young gardener told him that the book belonged to him. "To you?' replied the Duke. 'Do you underftand geometry, Latin, Newton?" I know a little of them, replied the young man with an air of fimplicity arifing from a profound ignorance of his own knowledge and talents. 'The Duke was furprifed; and having a talte for the fciences, he entered into converfation with the young mathematician : he afked him feveral queftions, and was aftonifhed at the force, the accuracy, and the candour of his anfwers. 'But how, faid the Duke, came you by the knowledre of all thefe things?' Stone replied, 'A fervant taught me, ten years fince, to read: does one need to know any thing more than the 24 letters in order to learn every thing' elfe that one wifhes?" The Duke's curiofity redoubled-he fat down upon a bank, and requefted a detail of all his proceedings in becoming fo learned.
"I firft learned to read, faid Stone: the mafons were then at work upon your houfe: I went near them one day, and I faw that the architect ufed a rule, compaffes, and that he made calculations. I inquired what might be the meaning and ufe of thefe things ; and I was informed that there was a fcience called Arithmetic: I purchafed a book of arithmetic, and I learned it. - I was told there was another fcience called Geometry : I bought the books, and I learnt geometry. By reading I found that there were good books in thefe two fciences in Latin: I bought a dictionary, and I learned Latin. I menderfood alio that there were good books of the fame kind in French: I bourht a dictionary, and I learned French. And this, my lord, is what I have done: it feems to me that we may learn every thing when we know the 24 letters of the alphabet."

This account charmed the Duke. He drew this wonderful genius out of his obfcurity ; and he provided him with an employment which left him plenty of time to apply himfelf to the fciences. He difcovered in him alfo the fame genius for mufic, for painting, for architecture, for all the fciences which depend on calculations and proportions."
"I have feen Mr. Stong. He is a man of great fimplicity. He is at prefent fenfible of his own knowledge; but he is not puffed up with it. He is pofferfed with a pure and diftinteretted love for the mathematics, though he is not folicitous to pafs for a mathematician; vanity having no part in the great labour he fuftains to excel in that fcience. He eefpifes fortune alfo; and he has folicited me twenty times to requelt the duke to give him lefs employment, which may not be worth the half of that he now has, in order to be more retited, and lefs taken off from his favourite fludies. He difcovers fometimes, by methods of his 8

\section*{S T O}
own, truths which others have difcovered before him. He is charmed to find on thefe occafions that he is not a firt inventor, and that others have made a greater progrefs than he thought. Far from being a plagiary, he attributes ingenious folutions, which he gives to certain problems, to the hints he has found in others, although the connection is but very diftant," \&c.

Mr Stone was author and trannator of feveral uleful works; viz. 1. A New Mathematical Dictionary, in 1 vol. 8 vo , firf printed in 1726 . 2. Fluxions, in I vol. \(8 \mathrm{vo}, 1730\). 'The Direct Method is a tranflation from the French, of Hofpital's Analyfe des Infiniments Petits; and the Inverfe Method was fupplied by Stone himfelf. 3. The Elements of Euclid, in 2 vols. 8 vo , 1731. A neat and ufeful edition of thofe Elements, with an account of the life and writings of Euclid, and a defence of his elements againft modern objectors. Befide other fmaller works. Stone was a fellow of the Royal Society, and had inferted in the Philofophical Tranf. actions (vol. 41, p. 218) an "Account of two (pecies of lines of the 3 d order, not mentioned by Sir Ifaac Newton or Mr Stirling."

Stone (Jerome), the fon of a reputable feaman, was born in the parih of Scronie, in the county of Fife, North Britain. His father died abroad. when he was but three years of age, and his mother, with her young family, was left in very narrow circumftances. Jerome, like the reft of the children, having got the ordinary fchool education, reading Englifh, writing, and arithmetic, betook himfelf to the bufinefs of a travelling chapman. But the dealing in buckles, garters, and fuch fmall articles, not fuiting his fuperior genius, he foon converted his little fock into books, and for fome years went through the country, and attended the fairs as an itinerant bookfeller. There is great reafon to believe that he engaged in this new fpecies of traffic, more with a view to the improvement of his mind than for any pecuniary emolument. Formed by nature for literature, he poffeffed a peculiar talent for acquiring languages with amazing facility. Whether from a defire to underfand the Scriptures in their original languages, or from being informed that thefe languages are the parents of many others, he began his philological purfuits with the ftudy of the Hebrew and Greek tongues; and, by a wonderful effort of genius and application, made himfelf fo far mafter of thefe, without any kind of affiftance, as to be able to interpret the Hebrew Bible and Greek Teftament into Englifh ad aperturam libri. At this time he did not know one word of Latin. Seufible that he could make no great progrefs in learning, without the knowledge of at leat the grammar of that language, he made application to the parifh fchoolmafter for his affiftance. Some time afterward, he was encouraged to profecute his ftudies at the Univerlity of St Andrew's. An unexampled proficiency in every branch of literature recommended him to the efteem of the profeffors; and an uncommon fund of wit and pleafantry rendered him, at the fame time, the favourite of all his fellow ftudents, fome of whom fpeak of him to this day with an enthufialtic degree of admiration and refpect. About this period fome very humorous poetical pieces of his compofition were publifhed in the Scots Magazine. Before he had finifhed his third feffion, or term, at St Andrew's, on an
application to the College by the matter of the fchool of Dunkeld for an uher, Mr Stone was recommended as the beft qualified for that office; and about two or three years after, the mafter being removed to Perth, Mr Stone, by the favour of his Grace the Duke of Atholl, who had conceived a high opinion of his abilitice, was appointed his fucceffor.

When he firft went to Dunkeld, he entertained but an unfavourable opinion of the Gaelic language; which he confidered as nothing better than a barbarous inarticulate gibberifh; but being bent on inveltigating the origin and defcent of the ancient Scots, he fuffered not his prejudices to make him neglect the ftudy of their primitive tongue. Having, with his ufual affiduity and fuccefs, maftered the grammatical difficulties which he encou:tered, he fet himfelf to difcover fomething of the true genius and character of the language. He collected a number of ancient poems, the production, of Irifh or Scottifh bards, which, he faid, were daring, innocent, paffionate, and bold. Some of thefe poems were tranflated into Englifh verfe, which feveral perfons now alive have feen in manufcript, before Mr Macpherfon publifhed any of his tranflations from Offian.

He died while he was writing and preparing for the prefs a treatife, intitled, "An Inquiry into the Original of the Nation and Language of the ancient Scots, with Conjectures about the Primitive State of the Celtic and other European Nations;" an idea which could not have been conceived by an ordinary genius. In this treatife he proves that the Scots drew their original, as well as their language, from the ancient Gauls. Had Mr Stone lived to finifh this work, which difcovers great. infrenuity, immenfe reading, and indefatigable induftry, it would have thrown light upon the dark and early periods of the Scottifh hiftory, as he opens a new and plainpath for leading us through the mexplored labyrinths of antiquity. But a fever put an end to his life, his labours, and his ufe ulnefs, in the year 1757 , being then \({ }^{\circ}\) only in the 30 th year of his age. He left, in manufcript, a much eftecmed and well-known allegory, intitled "The Immortality of Authore," which las been publifhed and often reprinted fince his death, and will be a lafting monument of a lively fancy, found judgement, and correct tafte. It was no fmall ornament of this extraordinary character, that he paid a pious regard to his ayed mother, who furvived him two years, and received an annual penfion from the Dutchefs of Atholl as a teftimony of refpect to the memory of her fon.
STONEHIVE, or Stonehaven, a fmall town in the county of Kincardine, in Scotland, 15 miles fouth from Aberdeen. It was built in the time of Charles II. and ftands at the foot of fome high cliffs, in a fmall bay, with a rocky bottom, opening a little in one part, fa that fmall veffels may find admittance, but only at high water. A pier laps over this harbour from the north fide to fecure them after their entrance. The town contains about 800 inhabitants. The manufactures are fail. cloths and Ofnaburghs, knit worfted and thread ftock. ings.

STONES, in natural hiftory, bodies which are infir pid, not ductile, nor inflammable, nor foluble in water. But as this is the definition given of earths by chemilta. and naturalifts, we mult refer the reader to the articles. Earth, and Mineralogy, Part II. clafs 1. for a

[ 808 ]

\section*{S T O} make a few oblervations concerning their natural hiftory.

As philofophers have perplexed themfelves much about the oricin and formation of the earth (a fubject certainly fay beyond the ken of the human intelleet, at leaft if we believe that it was made by the Almighty power of God), ío they have alfo propofed theories to explain the origin of tones. When philofophers lirnit their inquiries within the boundaries of fcience, where they are led by the fober and fafe conduct of cbfervatiou and experiment, their conclufions may be folid and may be ufe!ul; but when, throwing experiment and obfervation alide, they rear a theory upon an airy nothing, or upon a fingle detached fact, their theories will vanifh before the touch of true philofophy as a romantic palace before the rod of the enclanter. Sometimes from whim, or caprice, or vanity, they attempt to confound every thing: They wifl to prove that the foul is mere matter, that plants are animale, and that foffils are plants, and thus would banifh two fubflances, fpirit and dead matter, entiriely from the world; as if the Author of Nature were actuated by fordid views of parfinony in the works of creation, though we evidently fee that a generous profution is one of the characterif. tic marks of thefe works. We leave the tafk of confounding the different claffes of being to thofe philofophers whofe minds are too contracted to comprehend a great varisty of being at one view, or who prefer novelty to every thing elle. We content ourfelves with the old opinion, that the foul is a fpiritual fubftance; that plants are plants, and that fones are ftones.

We have been led into thefe remarks by finding that fome philofophers fay that ftenes are vegetables; that they grow and increafe in fize like a plant. This theory, we believe, was firt offered to the world by M. 'lournefort, in the year 1702, after returning, from his travels in the eaft. It was founded on a curious fact. In furveying the labyrinth of Crete, he obferved that the names which vifitors had engraved upon the rock were not formed of hollow but of pro. minent letters like baffo relievos. He fuppofes that thefe letters were at firlt hollowed out by knives; that the hollows have fince been filled up by the growth of the ftone; and hense he concludes that flones vegetate. We wifh we were fully affured of the fact that the letters were at firlt hollowed, before we attempt to account for their prominency. But even allowing the fuppolition to be true that they were at firlt hollow, we
reply it is oniy a fingle fact, and that it is altogether unphilofophical to deduce a gencral fytem from a fingle fact.
In the fecond place, this protuberancy of the characters is very improperly called vegetation, for it is not produced by a procefs in any refpect like the vegetation of a plant. Vegetation fuppofes veffels coittaining fuids and growth by expanfion; but who ever heard of veffels in a ftone, of fluids moving in them, or of the different parts expanding and fiveling like the branch or trunk of a tree? Even the fact which Tournefort mentions proves nothing. He does not pretend to fay, that the rock itfelf is increafing, but on!y that a few fmall hollows are filled with new fony matter, which rifes a little above the furrounding furface of the rock. This matter evidently has been once liquid, and at length has congealed in the channel into which ic had run.But is not this eafily explained by a common procefs, the formation of ftalactites? When water charged with calcareous matter is expofed to the action of air, the water evaporates, and leaves the calcareous carth behind, which hardens and becomes like a ftone.

Having thus examined the priacipal fact upon which M. Tour:efort founds his theory, it is unneceffary to follow him minutely throngh the reft of his fubject. He compares the accretion of matter in the labyrinth to the confolidation of a bone when broken, by a callus formed of the extravafated nutritious juice. This obfervation is thought to be confirmed, by finding that the projecting matter of the letters is whitifh and the rock itfelf greyifh. But it is eafy to find comparifons. The difficulty, as Pope fays, is to apply them. The refemblance between the filling up of the hollow of a ftone, and the confolidation of a broken bone by a callus, we confefs ourfelves not philofophers enough to fee. Were we writing poetry in bad tafte, perhaps it might appear. The circumftance, that the prominent matter of the letters is whitifh, while the rock is greyith, we fatter ourfelves ftreng thens our fuppolition that it con\({ }^{\text {fills }}\) of a depofition of calcareous matter. Upon the whole, we conclude, we hope logically, that no fuch theory as this, that fones are vegetables, can be drawn from the fuppofed fact refpecting the labyrinth. We have to regret, that the account which we have feen of the fubject is fo imperfeer, that we have not fufficient materials for a proper inveftigation. Tournefort has not even told us of what kind of fone or earth the accretion confifts; yet this fingle information would probably have decided the queftion ( A ).

Artifcial
(A) To give a more diftinct notion of 'Tournefort's theory, we fhall fubjoin his conclufions: From thefe obServations (he fays) it follows, that there are flones which grow in the quarries, and of confequence that are fed ; that the fame juice which nourifhes them ferves to rejoin their parts when broken; juft ds in the bones of animals, and the branches of trees, when kept up by bandages; and, in a word, that they vegetate. There is, then (he fays), no room to doubt but that they are organized; or that they draw their nutritious juice from the earth, 'This jnice muft be firtt filtrated and prepared in their furfact, which may be here eftecmed as a kind of bark; and hence it murt be conveyed to all the other parts. It is highly probable the juice*which filled the cavities of the letters was brought thither from the bottom of the roots; nor is there any more difficulty in conceiving this than in comprehending how the fap fhould pafs from the roots of our largeft oaks to the very extremities of their highett branches. Some ftones, then (he concludes), muft be allowed to vegetate and grow like plants: but this is not all ; (he adds), that probably they are generated in the fame manner; at leatt, that there are abundance of ftones whofe generation is inconceivable, without fuppofing, that they come from a kind of feeds, wherein the organical parts of the ftones are wrapped up as thofe of the largeft plants are in their feeds.

Rocking STove, or L.ogan, a fone of a prodigious fize, fo exactly poifed, that it would rock or fhake with the fmalleft force. Of thefe ftones the ancients give us fome account. Pliny fays, that at Harpafa, a town of Afia, there was a rock of fuch a wondercul nature, that if touched with the finere it would fhake, but could not be moved from its place with the whole force of the body*. Ptolemy Hepheftion mentions \(\dagger\) a gygonian ftone near the ocean, which was agitated when ftruck by the ftalk of an afphodel, but could not be removed by a great exertion of force. The word gygonius fecms to be Celtic ; for gwingog fignifies motitans, the rocking. ftone.

Many rocking ftones are to be found in different parts of this ifland; fome natural, others artificial, or placed in their pofition by human art. In the parifh of St Leven, Cornwall, there is a promontory called Caftle Treryn: On the weltern fide of the middle gronp, near the top, lies a very large fone, fo evenly poifed that any hand may move it from one fide to another ; yet it is fo fixed on its bafe, that no lever nor any mechanical force can remove it from its prefent fituation. it is called the Logan-flone, and is at fuch a height from the ground that no perfon can believe that it was raifed to its prefent pofition by art. But there are other rocking ftones, which are fo fhaped and fo fituated, that there can be no doubt but they were erected by human ftrength: Of this kind Borlafe thinks the great Qurit or Karn-lehau, in the parifh of Tywidnek, to be. It is 39 feet in circumference, and four feet thick at a medium, and ftands on a fingle pedeftal. There is alfo a remarkable ftone of the fame kind in the ifland of St Agnes in Scilly. 'The under rock \(A\) is 10 feet 6 inches high, 47 feet round the middle, and touches the ground with no more than half its bafe. The upper rock C refts on one point on!y, and is fo nicely balanced, that two or three men with a pole can move it. It is ei y ht feet fix inches high, and 47 in circumference. On the top there is a bafon \(D\) hollowed out, three feet eleven inches in diameter at a medium, but wider at the brim, and three feet deep. From the globular fhape of this upper ftone, it is highly probable that it was rounded by human art, and perhaps even placed on its pedef. tal by human ftrength. In Sithney parifh, near Helfton, in Cornwall, ftood the famous logan, or rocking ftone, commonly called Men Amber, q.d. Men an Bar, or the top-fone. It was eleven feet by fix and four high, and fo nicely poifed on another fone that a little child could move it, and all travellers who came this way defired to fee it. But Shrubfall, Cromwell's governor of Pendennis, with much ado caufed it to be undermined, to the great grief of the country. 'Ihere are fome marks of the tool on it, and, by its quadrangular fhape, it was probably dedicated to Mercury.

That the rocking ftones are monuments erected by the Druids cannot be doubted; but tradition has not informed us for what purpofe they were intended. Mr Toland thinks that the Druids made the people believe that they alone could move them, and that by a mira. cle; and that by this pretended miracle they condemned Vol. XVII. Part II.

\section*{\(809] \quad \mathrm{S}\) T O}
er acquitted the accufed, and brought criminals to con. Stone. fefs what could not otherwife be extorted from them.
\(\qquad\) How far this conjecture is right we thall leave to thofe who are deeply verfed in the knowledge of antiquities to determine.

Sonorous Stone, a kind of ftone remarkable for emitting an agreeable found wher ftruck, and muph ufed in China for making mufical inftruments which they call king.

The various kinds of fonorous fones known in China differ confiderably from onc another in beauty, and in the ftrength and duration of their tone; and what is very furprifing, is, that this difference cannot be difcovered either by the different degrees of their hardnefs, weight, or finenefs of grain, or by any other qualities which might be fuppofed to determine it. Sorne ftoncs are found remarkably hard, which are very fonorous; and others exceedingly foft, which have an excellent tone; fome extremely heavy emit a very fweet found ; and there are others as light as pumiccfone which have alfo an agreeable found.

The chemifts and naturalifts of Europe have never yet attempted to difcover, whether fome of our ftones may not have the fame properties as the fonorous ftones of the extremities of Afia. It however appears, that the Romans were formerly acquainted with a fonorous ftone of the clafs of biang-che. Pliny (fays the Abbé du Bos, in his Reflections on Poetry and Painting, when fpeaking of curious ftones) obferves that the ftone called chalcophonas, or brazen found, is black; and that, according to the etymology of its name, it fends forth a found much refembling that of brals when it is ftruck. The paffage of Pliny is as follows: Cbalcophonas nigra oft; Jed elifa aris tinnilum redilit.

Some fonorous fones were at length fent into France, and the late Duke de Chaulnes examined them with particular attention. The following are fome of his obfervations: "The Academy of Sciences, Mr Romé de Lifle, and feveral other learned mineralogifts, when anked if they were acquainted with the black ftone of which the Chinefe king was made, for anfwer cited the paf. fage of Pliny mentioned by Boethius de Bott, Linnæus, and in the Dictionary of Bomare, and added what Mr Anderfon fays in his Natural Hitory of Iceland refpecting a bluifl kind of ftone which is very fonorous. As the black ftone of the Chinefe becomes of a bluift colour when filed, it is probably of the fane fpecies. None of the reft who were confulted had ever feen it. The Chinefe ftone has a great refemblance at firt fight to black marble, and like it is calcarcous; but marble generally is not conorous. It alfo external. ly refembles touchftone, which is a kind of bafaltes, and the bafaltes found near voleanos; but thefe two ftones are vitrifications."
The duke next endeavoured to procure fome information from the ftone-cutters. They all replicd, that blue-coloured marble was very fonorous, and that they had feen large blocks of it which emitted a vory ftrong found; but the duke having ordered a king to be conftructed of this kind of ftome, it was found that it did not poffefs that property. By trying the black marble of Flanders, a piece was at length found which emitted an agreeable found : it was cut into a king, which is almoft as fonorous as thofe of China. All theie obferva-

tions give us reafon to believe that the ftones of which the king are formed are nothing elfe but a black kind of marble, the conftituent parts of which are the fame as thofe of the marble of Europe, but that fome difference in their organization renders them more or lefs fonorous.

Swine-Stone (lapis fuillus), or fetid fone, fo called from its exceffively fetid fmell, calcareous earth impregnated with petroleum. It is found, I. Solid, with the particles fcarcely vifible, of a black colour, as the marble does in Flanders, and in the province of Jutland in Sweden. 2. With vifible grains of a blackilh brown colour, found likewife in fome places of Sweden. 3. With coarfe fcales, found alfo in Sweden. Great part of the limeftones found in England belong to this clafs, and emit a very fetid fmell when ftruck violently, but it foon goes off in the fire.

Stone Marrow. See Clay, \{pecies 4.
Stone-Ware, a fpecies of pottery fo called from its hardnefs. See \(D_{\text {flft-Ware }}\), Porcelain, and Pottery.

Clay is a principal insredient in pottery of all kinds which has the property of hardening in the fire, and of receiving and preferving any form into which it is moulded. One kind of clay refilts the molt violent action of the fire after being hardened to a certain degree, but is incapable of receiving a fufficient degree of hardnefs and folidity. A fecond kind affumes a hardnefs refembling that of fint, and fuch a compactnefs that veffels made of it have a gloffy appearance in their fracture refembling porcelain. Thefe two fpecies owe their peculiar properties of refifting heat without melting, to fand, chalk, gypfum or ferruginous earth, which they contain. A third fpecies of clay begins to harden with a moderate fire, and melts entirely with a ftrong fire. It is of the fecond fpecies that fone-ware is made.

The moft famous manufactory of fone-ware, as well as of other kinds of pottery, is at Burflem in Staffordthire. 'I his can be traced with certainty at leatt two centuries back; but of it3 firf introduction no tradition remains. In 1686, as we learn from Dr Plot's Natural Hiftory of Staffordfhire publifhed in that year, only the coarfe yellow, red, black, and mottled wares, were made in this country; and the only materials employed for them appear to have been the different coloured clays which are found in the neighbourhood, and which form fome of the meafures or ftrata of the coal-mines. Thefe coarfe clays made the body of the ware, and the glaze was produced by powdered leadore, Sprinkled on the pieces before firing, with the addition of a little manganefe for fome particular colours. The quantity of goods manufactured was at that time fo inconfiderable, that the chief fale of them, the Doctor fays, was "to poor crate-men, who carried them on their backs all over the country."

About the year 1690 , two ingenious artifans from Germany, of the name of Eller, fettled near Burflem, and carried on a fmall work for a little time. They brought into this country the method of glazing ftoneware, by cafting falt into the kiln while it is hot, and fome other improvements of lefs importance; but finding they could not keep their fecrets to themfelves, they left the place rather in difguft. 'From this time various kinds of ftone-ware, glazed by the fumes of falt in the manner above-mentioned, were added to the wares
before made. The white kind, which afterwards became, and for many fucceeding years continued, the Itaple bratıch of pottery, is faid to have owed its origin to the following accident. A potter, Mr Aftbury, travelling to London, perceived fomething amifs with one of his horfe's eyes, an hoftler at Dunitable faid he could foon cure him, and for that purpofe put a com. mon black flint ftone into the fire. The potter oblerving it, when taken out, to be of a fine white, immediately conceived the idea of improving his ware by the addition of this material to the whiteft clay he could procure: accordingly he fent home a quantity of the flint ftones of that country, where they are plentifus among the chalk, and by mixing them with tobaccopipe clay, produced a white ftone ware much fupètio: to any that had been feen before.

Some of the other potters foon difcovered the fource of this fuperiority, and did not fail to follow his example. For a long time they pounded the flint ftone3 in private rooms by manual labour in mortars ; but ma. ny of the poor workmen fuffered 「everely from the duft of the flint getting into their lungs, and producing dreadful courhs, confumptions, and other pulmonary diforders. Thefe difafters, and the increafed demand for the flint powder, induced them to try to grind it by mills of various conitructions; and this method being found both effectual and fafe, has continued in practice ever fince. With thefe improvements, in the begins ning of the prefent century, various articles were pro. duced for tea and coffee equipages. Soon after at . tempts were made to furnilh the dinner table alfo; and before the middle of the century, utenfils for the table were manufactured in quantity as well for exportation as home confumption.

But the falt glaze, the only one then in ufe for this purpofe, is in its own nature fo imperfeet, and the potters, from an injudicious competition amony themfelves for cheapnefs, rather than excellence, had been fo inattentive to elegance of form and neatnefs of work. manfhip, that this ware was rejected from the tables of perfons of rank; and about the year 1760, a white ware, much more beautiful and better glazed than ours, began to be imported in confiderable quantities from France.

This inundation of a foreign manufacture, fo much fuperior to any of our own, muft have had very bad effects upon the potteries of this kingdom, if a new one; ftill more to the public tafte, had not appeared foon after. In the year \({ }^{7} 763 \mathrm{Mr}\) Jofiah Wedgwond, who had already introduced feveral improvements into this art, invented a fpecies of earthen ware for the table quite new in its appearance, covered with a rich and brilliant glaze, bearing fudden alternations of heat and cold, manufactured with eafe and expedition, and cons fequently cheap, and having every requifite for the purpofe intended. To this new manufacture the queen was pleafed to give her name and patronage, commanding it to be called શuen's ware, and honouring the inventor by appointing him her majefty's potter.

The common clay of the country is ufed for the ordinary forts; the finer kinds are made of clay from Devonfhire and Dorfethire, chiefly from Biddeford; but the flints from the lhames are all brought rough by fea, either to Liverpool or Hull, and fo by Bar. ton. There is no conjecture formed of the original rea.

\section*{\(S\) T \(O\)}
\(811]\)
calls trilithons, and above 30 feet high, rifing in height as they go round, and cach pair leparate, and not connected as the outer pair ; the higheft 8 feet. Within thefe are 19 more fmaller fingle flones, of which only 6 are flanding. At the upper end of the Adytum is the altar, a large flab of blue coarfe marble, 20 inches thick, 16 feet long, and 4 broad; preffed down by the weight of the vaft fones that have fallen upon it. The whole. number of fones, uprights, impofts, and altar, is exactly 140 . The ftones are far from being artificial, but were moft probably brought from thofe called the Grey Weathers on Marlborough Downs, 15 or 16 niles off; and if tried with a tool they appear of the fame hardnefs, grain, and colour, generally reddifh. The heads of oxen, deer, and other bealts, have been found on digging in and about Stonehenge; and human bones in the circumjacent barrows. There are three entrances from the plain to this fructure, the moft confiderable of which is from the north-ealt, and at each of then were raifed on the outfide of the trench two huge ftones with two fmaller within parallel to them.

It has been long a difpute among the learned, by what nation, and for what purpofe, thefe enormous ftones were collected and arranged. The firtt account of this flructure we meet with is in Geoffry of Monmouth, who, in the reign of King Stephen, wrote the hiftory of the Britons in Latin. He tells us, that it was ereeted by the counfel of Merlin the Britifh enchanter, at the command of Aurelius Ambrofius the laft Britifh king, in memory of 460 Britons who were murdered by Hengift the Saxon. The next account is that of Polydore Virgil, who fays that the Britons erected this as a fepulchral monument of Aurelius Ambrofius. Others fuppofe it to have been. a fepulchral monument of Boadicea the famous Britifh Queen. Inigo Jones is of opinion, that it was a Roman temple ; from a flone 16 feet long, and four broad, placed in an exact pofition to the caftward, altar-fafhion. Mr Charlton attributed it to the Danes, who were two years mafters of Wiltthire ; a tin tablet, on which were fome unknown characters, fuppofed to be Punic, was digged up near it in the reign of Henry VIII. but is loft ; probably that might have given fome information relpecting its founders. Its conmon name, Stonebenge, is Saxon, and figniifes a " ftone gallows," to which thofe fones, having tranfverfe impofts, bear fome refemblance. It is alio called in Welch choir gour, or " the giants dance."

Mr Grofe thinks that Dr Stukeley has completely proved this fructure to have been a Britifh temple in which the Druids officiated. He fuppofes it to have been the metropolitan temple of Great Britain, and tranflates the words choir gour "the great choir or temple." The learned Mr Bryant is of opinion that it Grfe's was erected by a colony of Cuthites probably before Antiquitites, the time of the Druids; becaufe it was ufual with them vol. vi. to place one valt ftone upon another for a religious me- \(\mathrm{p} . \mathrm{c}^{0}\). morial; and thefe they often placed fo equably, that even' a breath of wind would fometimes make them vibrate. Of fuch ftones one remains at this day in the pile of Stonehenge. The ancients diftinguifhed ftones erected with a religious view, by the name of amber; by which was fignified any thing folar and divine. The Grecians called.

Stone:
henge. ircles and two ovals. The outer circle is about 108 feet and two own. 6 about 10 uprights and 30 impolts, of which remain only 24 uprights, 17 ftanding and 7 down, \(3 \frac{1}{2}\) feet afunder, and 8 impolts. Eleven uprights have their 5 impolts on them by the grand entrance. Thefe fones are from 1.3 to 20 feet high. The leffer circle is fon: what more than 8 feet from the infide of the outer one, and confifted of 40 leffer ftones (the higheft 6 feet), of which only 19 remain, and only I.I ftanding: the walk hetween thefe two circles is 300 feet in circumference. The Adytum or Cell is an oval formed of 10 ftones (from 16 to 22 feet high), in pairs, with impofts, which Dr Stukeley

\section*{\& T O}
coraine to Mir Bryant, is compofed of thefe anhe ftones : hence the next town is denominated Ambrefoury; not from a Roman Ambrofus, for no fuch perfon ever exifted, but from the ambrofie petry, in whofe vicinity it ftood. Some of thefe were rocking ftones ; and there was a wonderful monument of this fort near Penzance in Cornwall, which ftill retains the name of main-amber, or the facred fones. Such a one is mentioned by Apollonius Rhodius, fuppofed to have been raifed in the time of the Argonautæ, in the ifland Tenos, as the nonument of the two-winged fons of Boreas, flain by Hercules; and there are others in China and other countries.

S COOK, a term ufed in many parts of the kingdom for a fhock of corn containing 12 hheaves.

STOOL, in medicine, an evacuation or difcharge of the freces by the anus.
Stool, in mining, is ufed when the miners leave off digging deeper, and work in the ends forward. The end before them is called the fool.

STOOL, in fhip-building, the name of the fupporters of the poop and top lanterns.
STOOPING, in falconry, is when a hawk, being upon her wings at the height of her pitch, bends down violently to take the fowl.

STOPPERS, in a fhip, certain fhort pieces of rope, which are ufually knotted at one or both ends, according to the purpofe for which they are defigned. They are either ufed to fufpend any heavy body, or to retain a cable, fhroud, \&c. in a fixed pofition.. Thus, the anchors, when firlt hoitted up from the ground, are hung to the cat-head by a ftopper attached to the latter, which paffing through the anchor-ring, is afterwards faftened to the timber-head; and the fame rope ferves to faften it on the bow at fea; or to fufpend it by the ring which is to be funk from the hip to the bottom. The floppers of the cable have a large knot and a laniard at one end, and are faftened to a ring-bolt in the deck by the other. They are attached to the cable by the laniard, which is faltened fecurely round both by feveral turns paffed behind the knot, or about the neck of the ftopper; \(\rho\) by which means the cable is reftrained from running out of the thip when fhe rides at anchor.

The ftoppers of the fhroud have a knot and a laniard at each end. They are only ufed when the throuds are cut afunder in battle, or difabled by tempeftuous weather; at which time they are lafhed, in the tame manner as thofe of the cables, to the feparated parts of the fhroud, which are thereby reunited, fo as to be fit for immediate fervice. This, however, is only a temporary expedient.

panies the confumption of the finel. In Pnevimatics we alfo attended to the manner in which our tires im. mediately operate in warming our apartments. At prefent, when about to defcribe a method of warming intrinfically different, we mult pay fome more attention to the diftinguifhing circumftance. Without pretending to explain the phyfical connection of heat and light, it may fuffice to obferve, that heat, as well as liyht, is communicated to diftant bodies in an inftant by radiation. A perfon paffing haftily by the door of a glafs-houfe feels the glow of heat in the very moment he fees the dazzling light of the furnace mouth, and it is interrupted by merely fereening his face with his hand. In this way is an apartment partly warmed by an open fire; and we avoid the oppreffive heat by fitting where the fire is not feen, or by interpofing a fcrecn. We are apt to connect this fo ftrongly in the imagination with the light emitted by the fire, that we attribute the heat. to the inmediate action of the light. But this opinion is fhown to be gratuitous by a curious experiment made before the Royal Society by 1)r Hooke, and afterwards, with more care and accuratc examination, by MrScheele. They found, that by bringing a plate of the moft tranfparent glafs brikkly between the fire and one's face, the heat is immediately intercepted without any fenfible diminution of the light. Scheele, by a very pretty inveftigation, difcovered that the glafs made the feparation, and did it both in refraction and reflection; for he found, that when the light of the fame fire was collected into a focus by means of a polifhed metal concave fpeculum, a thermometer placed there was inftantly, affected. But if we enploy a glafs fpeculum foiled in the ufual manner with quickfilver, of the fame diameter and focal diftance, and of equally brilliant reflection, there is hardly any fenfible heat produced in the focus, and the thermometer muft remain there for a very long while before it is fenfibly affected. When we repeated this curious experiment, we found, that atter the glafo has remained a long while in this pofition, whether tranfmitting or reflecting the light, it lofes in a great meafure its power of iutercepting the heat. By varying this obfervation in many of its circumftances, we think ourfelves entitled to conclude, that the glafs abforbs the heat which it interccpts, and is very quickly heated by the abforption. While it rifes in its own temperature, it intercepts the heat powerfully ; but when it is, as it were, faturated, attracting no more than what it immediately imparts to the air in corporeal contact with it, the heat paffes freely through along with the light. If the glafs be held fo near the fire that the furrounding air is very much heated, no ferfible interruption of heat is perceived after the glafs is thus faturated. We found the check more quickly fenfible than the thermometer of this inftantaneous radiation of the beat which accompanies the light, or is feparated from it in this experiment. It is a very inftructive experiment in the phyfiology of heat.

We cannot fay how far this radiation of heat may extend, nor whether the accompanyment of light is abfolutely neceffary. The mathematician proceeds on the fuppofition that it extends as far as the radiation of light, and that, being alfo rectilineal, the denfity of the heat is proportional to that of the light. But thefe notions are fomewhat gratuitous; and there are
appearancss.

\section*{S T O}
appearances which render them doubtful. When with a lens of an inch in diameter we form a focus on a piece of black unpolifhed marble of an inch diametcr, the mathematician muft allow that no more rays fall on the marble than if the lens were away: therefore the marble fhould be equally, warmed in either cafe. But it is by no means fo, as we have repeatedly found by expofing it during equal times, and then dropping it into water. The water which is heated by the marble on which the focus has been formed will be found to have acguired from it much more heat than from the other. The tops of lofty mountains which are never fhaded by clouds, but enjoy perpetual funfhine and ferenity, inflead of being warmer than the valleys below, are covered with never-melting fnow; and we have fome grounds to fufpect that the senial influence of the fun requires the co-operation of the atmofphere, and to doubt whether there is any warmth at the moon, on which no atmofphere like ours can be obferved. Perhaps the heat which cheers us, and fertilizes our earth, is chemically leparated from our atmofphere by its elective attraction for the light of the fun. Our fucceffors in the ftudy of meteorology need not fear that the fubject of their refearch will be foon deprived of fcientific allurements. We know but little of it after all the progrefs we have made during this laft century, and it ftill prefents an ample field of difcuffion.
We faid that the accompanyment of light is not demonftrably neceffary. We are certain that heat may be imparted without any fenfible light, in a manner which we can hardly fuppofe any thing but radiation. If a piece of very hot iron be placed-a little without the principal focus of a metallic concave fpeculum, and a very fenfible air-thermometer be placed in its conjugate focus, it will inflantly fhow an elevation of temperature, although the iron is quite imperceptible to an eye which has even been a long while in the dark. No fuch rife of temperature is obferved if the thermometer be placed a little to one fide of the focns of the fipeculum; thetefore the phenomenon is precifely funilar to the radiation of liolit. We are obliged therefore to acknowledge that the heat is radiated in this experiment in the fame way that light is in the common optical experiments.'
Although this is the molt ufual way that we in this country employ fuel for warming our apartments, it is by no means the only way in which the heat diffured from this fuel may be imparted to diftant bodies. It is not even the moft effectual method; it is diffufed allo by. immediate communication to bodies in contact. The air in immediate contact with the burning fuel is heated, and imparts fome of its heat to the air lying beyond it, and this is partly fhared with the air which is ftill farther-off; and this diffufion, by communication in contagu, goes on till the remote air contiguons to the walls, the floor, the ceiling, the furniture, the company, all get a fhare of it in proportion to their attractions and their capacities. And as the air is thus continually fupplied, and continually gives ont heat, the walls, \&c. become gradually warmer, and the room becomes comfortable and pleafant. But we apprehend that no great proportion of the heat actually acquired by the room is communicated in this way. This diffufion by contact is but flow, efpecially in air which is very dry; fo flow indeed, that the air in the immediate eighbourhood of the full is hurried up the chimney be,

\section*{\(813] \quad\) T O}
fore it has time to impart any of the heat received in contact. We know that the time employed in diffufing itfelf in this way through fagnant air to any moderate diftance is very confiderable. We imagine therefore that the heat communicated to our rooms by an open fire is chiefly by radiation, but in a way fomething different from what we mentioned before. We imagine, that as the piece of glafs in Dr Hooke's expeliment abforbs the heat, fo the whole mafs of air which fills the room intercepts the radiated heat in every part of the room where the fire is feen, and is as it were faturated with it throughout, and ready to impart it to every body immerfed in it. We cannot otherwife account for the equability of the heat in the different parts of the room. Mere sadiation on the folid bodies would warm them in the inverfe duplicate ratio of their diftances from the fire; and diffufiod by contact, if compatible with the rapid current up the chimney, would heat the room fill more unequably. Recolle et how flowly, and with what rapid diminution of intenfity, the colour of blue vitriol is communicated to water even to a very fmall diftance. But becaufe all paits of the air of the room abforb radiated heat, what is faturated at a higher temperature, being nearer to the fire, rifes to the ceiling, fpreads outwards along the ceiling, and has its place fupplied by the air, which is thus pufhed towards the fire from the places which are not direetly illuminated.

Far different is the method of warming the room by a Itove. Here the radiation, if any, is very feeble or fcunty; and if a paffage were allowed up the chimney for the warmed air, it would be quickly tarried off. 'This is well known to the Englifh who refide in the cold climates of St Peterfourgh, Archangel, \&c. They love the exhilaratiny flutter of an open fire, and often have one in their parlour ; but this, fo far from warmiag the room durisg the extreme cold weather, obliges then to heat their lioves mole frequently, and even abflracts the heat from a whole fuite of apartments. But all paffages this way is fhut up when we warm a room by foves. The air immediately contiguous to the ltove is heated by contact, and this heat is gradually, though flowly, diffufed through the whole room. The differion would however be very flow indeed, were it not for the great expanfibility of air by heat. But the air furrounding the fove quickly expands and rifes to the ceil ing, while the neighbourng air flices in to fupply the place, nay is even puthed in by the air which goes outwards aloft. 'Thus the whole air is foon mixed, and the room acquires almott an equal temperature throughout.

The warming by foves muft therefore be managed upon very different principles from thofe adopted in the emoloyment of open fires. The general principle is, \(1 f\), 'To employ the fuel in the moft effectual manner for keating the extermal part of the fove, which is immediately efficient in warming the contiguous air; and, \(2 d\), To keep in the room the air already warmed, at leaft as much as is confiftent with wholefomenefs and cleanlinefs.

The firt purpofe is accomplified by conducting the flue of the furnace round its external parts, or, in fhort, by making every part of the flue external. Of all : forms, that of a long pipe, returned backwards and for-o wards, up and dowa (provided only that the place of

\section*{S T O}
its laft difcharge be confiderably higher than its entry from the fire-place), would be the moft effectual. We have feen a very fmall fove confructed in this way, the whole being inclofed in a handfome cafe of polifhed iron plate, pierced and cut into elegant foliage like the cock of a watch, fo that the odd looking pipes were completely concealed. Theugh only three feet long, one fort thick, and fix feet high, it warmed a very lofty room of \(\overline{2} 4\) feet by 18 , and confumed lefs than half the fuel of a flove of the more ufual make, which did not fo fully warm a fmaller chamber.

It would occupy a volume to defcribe the immenfe varicty of floves which ingenuity or architectonic tafte has conftructed. We thall content ourfelves with giving a fpecimen of the two chief claffes into which shey may be diftinguifhed.

The air of a room may be equally warmed, either by applying it to the furface of a fmall flove made very hot, or to the furface of a much larger flove more moderatcly heated. The frft kind is chiefly ufed in Holland, Flanders, and the milder climates of Germany and Poland. The laft are univerfally ufed in the frozen climates of Ruffa and Sweden. The firft are generally made of catt-iron, and the laft of brick-work covered with glazed tiles or ftucco.

Fig. 1. reprefents a fmall German ftove fully fufficient for warming a room of 24 feet by 18 . The bafe is about three feet broad and 14 inches deep, that is, from back to front, and fix or feven feet high. The decoration is in the fathion of that country ; but the operative ftructure of it will admit of any fyle of ornament. A, is the fire-place, and the wood or charred coal is laid on the bottom, which bas no bare. Bars would admit the air too freely among the fuel, and would both confume it too faft and raife too great a heat. That no heat may be ufelefsly expended, the fole of the fire place and the whole bottom of the fove is raifed an inch or two above the floor of the room, and the air is therefore warmed by it in fucceffion, and rifes upwards. For the fame reafon the back of the fove is not in contact with the wall of the room, or of the tuiche in which it is placed. The fire-place is fhut up by a door which fits clofely to its cafe, and has a mall svicket at the bottom, whofe aperture is regulated by a fliding plate, fo as to admit no more air than what fuffices for nowly confuming the fuel. The flame and heated air rife to the top of the fire-place three or four inches above the arch or mantle-piece, and get out laterally by two narrov paffages \(\mathrm{B}, \mathrm{B}\), immediately below the top plate of the bale. 'The current bends downward on each fide, paffes at \(\mathrm{C}, \mathrm{C}\), under the partition plates which divide the two fide chambers, and then rifes upwards through the outer divifion of each, and paffes through narrow lits \(D, D\), in the top plate, and from thence along the two hollow piers E, E. The two lateral currents unite at the top of the arch, and go through the fingle paffage F into the larger hollo w behind the efcutcheon C. From this place it either goes ftraight upwards into the vent in the wall by a pipe on the top of the ftove, or it goes into the wall behind by a pipe inferted in the back of the ftove. The propriety of this conftruction is very obvious. The current of hot air is applied to exterior parts of the flove everywhere except in the two fide chambers of the bafe, where the partition-plates form one fide of
the canal. Even this might be avoided by making each of thefe fide chambers a detached hollow pillar. But this would greatly increafe the trouble of conitruction and joining toyether, and is by 10 means neceffary. The arch H has a graceful appearance, and affords a very warm fituation for any thing that requires it, fuch as'a drink in a fick perfon's bed-chamber, \&c. Perfons of a certain clafs ufe this place for keeping a difh warm ; nay, the lower part of the arch is frequently occupied by an inclofed chamber, where the heat rifes high enough even for dreffing vi\&uals, as will be eafly imagined when we reflect that the fole of it is the roof of the fire-place.

The fove now defcribed is fupplied with fuel and with air by the front door opening into the room. That there may be room for fuel, this middle part projects a few inches before the two fide chambers. Thefe laft, with the whole upper part of the fove, are not more than ten inches deep. The paffages, therefore, from the fire-place are towards the back of it; fo that if we have a mind to fee the fire (which is always cheerful), the door may be thrown open, and there is no danger of the fmoke coming out after the current has once warmed the upper part of the ftove. When the ftove is of fuch dimenfions that the bafe is about two feet and a half or three feet high, the fire-place may be furnilhed with a fmall grate in the Britifh ityle. If the door is fo hung that it can not only be thrown back, but lifted off its hinges, we have a fove-grate of the completeft kind, fully adequate, in our mild climate, to warm a handfome apartment, even with an open fire; and when we hang on the door, and fhut up the fire-place, a flove of the dimenfions already given is almoft too much for a large drawing.room.
We have frequently remarked, that one fide of thefe ftoves grows much warmer than the other, and that it was difficult to prevent or remedy this; and we imagine that this is an unavoidable defect in all foves with a double fluc. It is fcarcely poffible to make the fire fo equable in the fire-place, that one fide fhall not be a little warmer than the other, and a brikker current will then be produced in it. This mult increafe the confumption of the fuel on this fide, which will increafe the current, will heat this fide ftill more, and thus go on \({ }^{\circ}\) continually till the fuel on this fide is expended; after which the other fide will obtain ard increafe the fuperiority. The flue is made double, that the fire-place may occupy the middle of the front; and it will be difficult to gain this point of lymmetry with one flue. The inconvenience may, however, be corrected by damping valves placed in fome part of the upright funnels E, E.

In the colder winters on the continent, it is thought neceffary to increafe the effect by making the fire-place open to the back of the ftove. Its mouth or door communicates with or is joined to an opening of the fame dimentions formed in the wall, and the door is on the other fide in an antichamber or lobby. In Weftphalia, and other places of Germany, the apartments are difpofed round a fpacious lobby, into which all their fireplaces open, and are there fupplied with fuel. By this conitruction it is plain that the air of the room, already warmed by the ftove, is not carried off, and the room is more heated. But this method is very unfavourable to cheerfulnefs and health. The fame air confined, and

\section*{S. T O}
repeatedly breathed and compounded with all the vola. tile emanations of the room, quickly lofes that refrefh. ing quality that is fo defirable, and even fo neceffary for health. It is never renewed except by very partial admixtures when the room doors are thrown open, and becomes difagreeabie to any perfon coming in from the open air; and in the houfes of the lefs opulent becomes really offenfive and naufeous.

Something of this is unavoidable in all rooms heated by foves. Even in our apartments in this ifland, perfons of delicate nerves are hurt by what they call the clofe air of a room; and it is long before the fmell of dinner is quite removed from a dining-room, notwithftanding the copions current up the chimney. This muft be incomparably more fenfible in a room heated by a fove; and this inconvenience is peculiarly fenfible with refpect to the fove which we are confidering at prefent, where we employ a fmall furface heated to a great degree.

Such foves are feldom made of any thing elfe than caft-iron. This (in thofe parts at leaft which are in inmediate contact with the fuel) is in a fate of conti. nual calcination, and even throwing off fcales. This indeed is not feen, becaufe it is the bottom or fole of the fire-place which is fo heated: but the effect on the air of the room is the fame. The calcination of the iron is occafioned by the combination of pure vital air with the iron. This is ab!racted from the general mafs of atmofpheric air in the room, of which it ufually conftitutes about \(\frac{2}{5}\) ths. By this abftraction the remainder becomes lefs fit for fupporting animal life or flame, and may even become highly deleterious. In every degree the remainder becomes lefs refrefhing, and grows dull and oppreffive. This is always accompanied by a peculiar fmell, which, though not difyufting, is unpleafant. It refembles the fmell of burnt feathers, or more exactly the fmell we. feel if we rub violently for fome time the palms of our hands together when perfectly dry.

For fimilar reafons thefe iron floves occafon a fickly fmell, by burning every particle of duft which falls on the hot parts; and if they be wiped with a woollen cloth, or any cleth not perfectly free from every kind of greafy or oily matter, a fmell is produced for a day or days afterwards; fo that without the moft fcrupulous attention we fuffer by our very cleanlinefs.

For fuch reafons we think that the ftoves of brickwork covered with ftucco or with glazed tiles are vaftly preferable. Thefe are much ufed in the genteeler houfes in Flanders and Holland, where they are made in the moft elegant forms, and decorated with beautiful fculpture or enamel ; but it is plain that they cannot be fo effectual, nor equally warm a room with the fame ex: pence of fuel.. Earthen ware, efpecially when covered with porous ftucco, is far inferior to metal in its power of conducting heat. If built of bricks, they muft be vaftly more bulky when the fire-place and flues are of the fame dimenfions. The maft perfect way of confructing them would certainly be to make them of pottery, in parts exactly fitred to each other, and joined by a proper cement. This mode of conftructing would ad. mic of every elegance of form or richnefs of ornament, and would not be fo bulky as thofe which are built of bricks. The great difficulty is to prevent their crack-
ing by the heat. Different parts of the ftove being of very different heats, they expand unequally, and there is cement which can withfland this, efpecially when we recollect that the fame heat which expands the baked earth caufes the clay or cement, with which the parts of the ftove are put together or covered, to contract. Accordingly thofe earthen ware foves feldom ftand a winter or two without cracking in fome place or other, even when ftrengthened by iron hoops and cramps judiciouny difpofed within them. Even hooping them externally, which would be very unfightly, will not prevent this; for nothing can refir the expan. fion and contraction by heat and cold. When a crack happens in a ftove, it is not only unfiglitly, but highly dangerous; becaufe it may be fo fituated, that it will difcharge into the room the air vitiated by the fire.

For thefe ard other reafons, we can fcarcely hope to make Itoves of brick.work or pottery which fhall bear the neceffary heat without crackiug ; and their ufe muft therefore be confined to cafes where very moderate heat is fufficient. We need not defcribe their conftruction. It is evident that it fhould be more finple than that of iron foves; and we imagine that in the very few cafes in whicl they are likely to be employed in this country, a fingle fire-place and an arch over it, divided, if we pleafe, by a partition or two of thin tile to lengthen the flue, will be quite enough. If the fove is made in whole or in part of potters ware, a bafe for the fire-place, with an urn, column, obelink, or pyramidabove it, for increafing the furface, will allo be fufficient. The failure commonly happens at the joinings, where the different pieces of a cifferent heat, and perhaps of a different baking, are apt to expand unequally, and by working on each other one of them mutt give way. Therefore, inftead of making the joints clofe and ufing. any cement, the upper piece fhould ftand in a groove formed in the undermoft, having a little powdered chalk: or clay fprinkled over it, which will effectually prevent the paffage of any air; and room being thus given for the unequal expanfion, the joint remains entire. This may be confidered as a general direction for all furnacework, where it is in vain to attempt to hinder the mutual working of the parts.

We have feen foves in finall apartments at St Peterf: burg, which were made internally of potters ware, in a great variety of forms, and then covered with a thick coat of fucco, finifhed externally with the utmof elegance of ornament, and we were informed that they were very rarely fubject to crack. They did not give much heat, on account of the very low conducting power of the porous Aucco ; but we imagine that they would be abundantly warm for a moderate room in this country.
When fitted up in thefe. fituations, and with thefe precautions, the brick or pottery floves are incomparably more fweet aud pleafant than the iror ones.

But in the intenfe colds of Puffia and Sweden, or even for very large rooms in this kingdom, foves of thefe fmall dimenfions are not fufficiently powerfur, and we muft follow the practice of thofe countries where they are made of great fize, and very moderately heated. It is needlefs to defcribe their external form, which may be varied at pleafure. 'Their internal ftructure is the fame in all, and is diftinctly defcribed in Pneuma. tics, \(n^{0}\) 364. We fhall only enlarge a little on the
pectum-

\section*{S T O \\ [ 8r6] S To}

AERve.
,
peouliarities connected with the gencral principle of their conftruction.

The fove is intended as a fort of marazines in which a great quantity of heat may be quickly accu. mulated, to be afterwards flowly communicated to the air of the room. The ftove is therefore built extremely maffive ; and it is found that they are more powerful when coated with clay as wet as can be made to hang rogether. We imagine the reafon of this to be, that very wet clay, and more particularly ftucco, muft be exceedingly porous when dry, and therefore a very flow conductor of heat. Inftead of fticking on the glazed tiles with no more clay or ftucco than is fufficient to attach them, each tile has at its back a fort of box baked in one piece about two or three inches deep. It is reprefented in fig. 2. 'This is filled with mortar, and then ftuck on the brick-work of the fove, which has a great number of irnn pins or hooks driven into the joints, which may fink into this clay and keep it firmly attached when dry. This coating, with the maf. five brick-work, fqrms a great mafs of matter to be heated by the fuel. The loweft chamber, which is the fire-place, is fomewhat wider, and confiderably thicker than the ftories above, which are mercly flues. When the fire-place is finifhed and about to be arched over, a Alat iron bar of fmall thicknefs is laid along the top of the fide-wall on both fides, a fet of finifhing bricks being moulded on purpofe with a notch to receive the iron bar. Crofs bars are laid over thefe, one at each end and one or two between, having a bit turned down at the ends, which takes hold of the longitudinal bars, and keeps them from being thruft outwards either by the preffure of the arch or by the fwelling in confequence of the heat. In fig. 3. A is the crofs fection of one of the long bars, and \(B C\) is part of one of the crofs bars, and CD is the clench which confines the bar A. This precaution is chiefly neceflary, becaufe the contraction of the foove upwards obliges the walls of the other fीories to bear a little on the arch of the fire-place. The building above is kept together in like manner by other courfes of iron bars at every fecond return of the flue. The top of the fove is finifhed by a pretty thick covering of brick-work. The lait paflaye for the air at H (fee Pneumatics, fig. 62.) has a ring lining its upper extremity, and projecting an inch or two above it. 'The flat round it is covered with fand. When we would ftop this paffare, a cover thaped like a bafon or cover for difhes at table is whelmed over it. The rim of this, refting on the fand, effectually prevents all air from coming through and getting up the vent. Accefs is had to this damper by a door which can be fhut tight enough to prevent the heated air of the room from wafting itfelf up the vent. When the room is too warm, it may be very rapidly cooled by opening this door. "The warm air ruthes up with great rapidity; and is replaced by cool air from without.

The management of the itove is as follows. About eight o'clock in the morning the pietchniik, or fervant who has the charge of the foves, takes off the cover, Thuts the damper-door, and opens the fire-place door. He then puts in a handful of wood thavings orftraw, end kindles it. 'I'his warms the foove and vent, and Degins a current of air through it. He then lays a few chips on the fole of the fire place, immediately
within the door; and behind this he arranges the billets of birchwood, with their ends inwards. Then he lays on more wood in the front, till he thinks there is enough. He fets fire to the chips, fhuts the door, and opens the fmal! wicket at its bottom. The air blows the flame of the chips upon the billets behind them, and thus kincles them. They confume flowly, while the billets in front remain intouched by the fire. The fervant; having made his firt round of the rooms, returns to this ftove, and opens the door above to admit air into the vent. This is to fupply its draught, and thus to check the draught in the body of the ftove, which is generally too frong at this time, and would confume the fuel too faft. By this time the billets in the front are burning, firit at the bottom, and the reft in fucceffion as they fink down on the embers and come oppofite to the wicket. The room does not yet feel any effect from the fire, the heat of which has not yet reached its external furface; but in about half an heur this grows warm. The upper door is fhut again, that no heat may now be wafted. The pietchnik by and by fpreads the embers and afhes over the whole bottom of the fire-place with a rake, by which the bottom is greatly heatcd, and heats the air conticuous to it externally (for it ftands on little pillars) very powerfully. He takes care to bring up to the top of the afhes every bit of wood or coal that is not yet confumed, that all may be completely expended. He does this as brifkly as poffible, that the room may not lofe nuch warmed air by keeping oven the fire-place door. At his laft vifit, when he obferves no more glowing embers, he fhuts the fire-place door and wicket, and puts the damper on the paffage above, and fluts its door.-All this is over in about an hour and a half after kindling the fire. All current of air is now at an end within the fove, and it is now a great mafs of brick-work, heated to a great degree within, but only about blood-warm externally. The heat gradually fpreads outwards, and the external furface of the fove acquires its greateft heat about three o'clock in the afternoon; after which it gradually cools till next morning.
This heat feldom is fo great that one cannot bear to touch the fove with his cheek, and to keep it there. In confequence of this it can burn none of the dult which unavoidably falls on the ftove, and we are never troubled with the fickening fmells that are unavoidable when we employ the fmall caft iron ftoves much heated. 'Ihe great expence of heat in a room arifes from the glafs windows. The pane is fo thin that the external air keeps it continually cold, and thus the windows are continually robbing the air of the room of its heat. This expence of heat is rectuced to lefs than one third by double cafements. 'The inner cafement is about as much colder than the room as the outer cafement is warmer than the air of the fields; and we have the fingular advantare of havins no ice formed on the glaffes. But to enfure this laft advantage, the feams of the inner cafement muft be pafted with paper, and thofe of the onter cafement muft be left unpafted. If we do the contrary, we fhall certainly have ice on the outcr cafement; the reafon of which is tafily feen.

We have been thus particular in our defcription of the manarement, becaufe the reafons of fome particulars are not very obvious, and the practice would not readily occur to us in this country; fo that a perfon who, on the
faith of our recommendation, thould prefer one of thefe ftoves to the German fove, whofe management is fimple and obvious, might be greatly difappointed. But by following this method, we are confident that the Ruffian ftove will be found much fuperior both in warmth and agreeable air. The fpreading out of the embers, and waiting till all is reduced to afhes before the doors are fhut, is alfo abfolutely neceffary, and a neglect of it would expofe us to imminent danger of fuffocation by fixed air; and this is the only inconvenience of the Ruffian ftove, from which the other fove is free. The fixed air has no fmell ; and the firft indication of its prefence is a night giddinefs and laffitude, which difpofes us to fit down and to fleep. This would be fatal; and we muft immediately open the upper paffage and the fire-place door, fo as to produce a ftrong current to carry the vitiated air of the room up the chimney. Throwing np the fafhes, or at leaft opening all the doors, is proper on fuch an occafion.

If we burn pit-coal, either raw or charred, this precaution is fill more neceffary; becaufe the cinder is not fo eafily or fo foon completely confumed. This fuel will require a little difference in the management from wood fuel, but which is eafily feen by any perfon of reflection. The fafe way would be to rake out all halfburnt coal before fhutting up the doors.

If we ufe raw pit-coal, great care is neceffary to prevent the accumulation of foot in the upper part of the fove. It is an inacceffible place for the chimney fweep; and if we attempt to burn it out, we run a great rifk of fplitting that part of the flove which is the moft nightly conftructed. It is advifable therefore to burn it away every day, by giving a brik draught with an open door for five minntes. With wood or coak there is no danger.

It will not be improper in this place to give fome inflructions for the conftruction of foves for warming feveral floors in a oreat manufactory, fuch as a cottonmill, or a public library or mufeum.

In fuch fituations we think cleanlinefs; wholefomenefs, and fweetnefs of air, no lefs neceffary than in the drawing room of a man of opulence. We therefore rerommend the brick-ftove in preference to the iron one; and though it would not be the beft or mof economical practice to heat it but once a-day, and we fhould rather prefer the German practice of contant feeding, we still thirk it highly proper to limit the heat to a very moderate degree, and employ a large furface.

If the difpofition of the rooms, allows us the conveniency of a thick party-wall, we would place the fove in the middle of this wall, in an arch which pierces through the wall. Immediately above this arch we would carry up a very wide chimney through the whole height. This chimney muft have a paffage opening into each floor on both fides, which may be very accurately fhut up by a door. The fove being fet up under the arch, it mult have a pipe communicating with its flue, and rifing up through this chimney. Conld an earthen pipe be properly fupported, and fecured from fplitting by hoops, we fould prefer it for the reafons already given. But as this is perhaps expecting too much, we muft admit the ufe of a caft iron pipe. This is the real chimney or flue of the ftove, and muft be of as great diameter as poffible, that it may act, by an exzenfive furface, all the way up.

The flove A S T O air that is warnied under the arch in the wall; but the air that is warnied by its furface would efcape on both fides, and would be expended in that fingle floor. To prevent this, the flove muft be inclofed in a cafe: this may be of brick-work, at the diftance of two or three inches from the fove all round. It muft be well fuut in above, and at the foundation muft have a row of fmall holes to admit the air all around it. 'This air will then be warmed over the whole fpace between the flove and the cafe, pals up the chimney, and there receive additional heat from the flue-pipe whish is in the middle. Great care muft be taken that the fire-place door have no communication with the fpace between the fove and its cafe, but be inclofed in a mouth-piece which comes through the cafe, and openis into the feeding room. Thus all the air which goes up to the rooms will be pure and wholefome, provided we take care that every thing be kept clean and fweet about the air holes below. Obferve that thofe air-holes which are near the furnace door mutt be inclofed in a wooden trunk which takes in its air at fome diftance from this door; for fince the current between the fove and cafe may be almoft as freat as the current within the flove (nay, when a puff of wind beats down the chimney, it may even exceed it), there is a rifk of fome vitiated air and fmoke being drawn into the cafe.

If the flove cannot be placed in the arch of a partywall, it may be fet adjoining to a fide or outer wall, and furnifhed with a cafe, a large chinney, and a flue. pipe, in the fame manner. Hut in this cafe a great deal of heat is wafted on this outer wall, and carried off by the external air. In this fituation we would recommend to line that part of the wall which is behind the flove (at two or three inches diftance), and the whole of the chimney, with platter on laths. Thefe fhould be nailed on battens properly faftened on the wall, leaving a fpace of an inch between the laths and the wall. The plafter thould be of the moft fpungy kind, having in it a quantity of clay in powder inftead of the full proportion of fand. Horfe-duns, wafhed with water and ftrained through coarfe flannel, leaves a great portion of unaffimilated versetable fibre, which will mix very intimately in the plafter, and make it a fubftance very unfit for conducting heat. There is no danger of catching fire by this lining. We have feen a moft tremendous fire rage for three honrs, in contact with a partition of lathr and plafter (on the plafter-fide however), without difcolouring the thin laths on the other fide. We once faw a cottage climney on fire, and burn till the foot was confumed. This climney was nothing but a pipe of a foot wide, made ot lathes, and plaftered on the infide and outfide; and it paffed through a thatched roof. We therefore recommend this in place of the brick-cafe for inclofing the ftove. It would fave heat; and as it might be made in pieces on detached frames, which could be joined by iron ftraps and hinges, any part of the fove could be laid open for repairs at pleafure.

We have no hefitation in faying that a fove conftructed in this manner would be greatly fuperior in power to any we have feen, and would be free from many of their difgufting defects. We beg leave therefore to conclude this part of the fubject by detcribing one which was to have been erectcd in one of the churches of the city of Edinburgh.
Fig. 4. is a fketch of the plan of the church contain-

\section*{S T O} ed in the parallelogram AFED. P marks the place of the pulpit, and LMNO the front of the galleries. Thefe are carried back to the fide-walls AB and DC . But at the end oppofite to the pulpit they do not reach fo far, but leave a fpace BFEC about 12 feet wise. Below the back of the galleries, on each fide, there is a paffage \(A B G H, ~ K I C D\), feparated from the feated part of the church by partitions which reach from the floor to the galleries, fo that the face HGIK is completely fhut in. The church is an ancient Gothic building, of a light and airy ftructure, having two rows of large windows above the arcades, and a fpacious window in the eaft end above the pulpit. The congregation complain of a cold air, which they feel pourirg down upon their heads. This is more particularly felt by thofe fitting in the fronts of the galleries. We imagine that this arifes chiefly from the extenfive furface of the upper row of windows, and of the cold ftome. walls above, which robs the air of its heat as it glides up along the fides of the church. It becomes heavier by collapfing, and in this fate defcends in the middle of the church.

The ftove \(S\) is placed againft the middle of the weft wall at the diftance of a few inches, and is completely inclofed in a cafe of lath and plafter. The vent, which is to carry off the fmoke and burnt air, is conveyed up or along the wall, and through the roof or fide-wall, but without any communication with the caie. In like manner the fire-place door is open to the paffage, without communicating with the cafe; and care is taken that the holes which admit the air into the cafe are fo dif. pofed that they fhall run no rifk of drawing in any air from the fre-place door.

From the top of this cafe proceed two trunks \(Q, R\), each of which is two feet broad and fix inches decp, coated within and without with the moft fpungy plafter that can be compofed. For this purpofe we fhould recommend a compofition of powdered charcoal and as much clay and quicklime as will give it a very fight cohefion. We know that a piece of this may be held in the hand, without inconvenience, within an inch of where it is of a slowing red heat.- Thefe trunks open into another trunk XVTYZ, which ranges along the partiion immediately under the galleries, and may be formed externally into a corniche, a little maffive indeed, but not unfightly in a building of this ftyle. This trunk is coated in the fame manner. It has feveral openin rs \(a, a, \& c\). which have fliders that can be drawn afide by' means of handles acceffible from the outer paffage. - At the extremities X and Z of this trunk are two perpendicular trunks which come up through the galleries, and are continued to a confiderable height. At their junction with the horizontal trunk are two doors large enough to admit a lamp. Each perpendicular trunk has alfo a valve by which it can be completely ftopped.

The fove is managed as follows: Early in the morning the fuperintendant fhuts all the fliders, and fets a lamp (burning) in each of the trunks \(X\) and \(Z\), and fhuts the doors. He then puts on and kindles the fire in the flove, and manages it either in the Ruffian or German method Perhaps the latter is preferable, as being liable to feweft accidents from miftake or neglect.

The lamps fet in the lower \(\epsilon\) nds of the upright trunks prefently warm them, and produce a current of air upwards. This muft be fupplied by the horizontal trunk,

\section*{818 ]}

\section*{S T 0}
which mult take it from the cafe round the flove. Thus a current is begun in the direction we wih. By and by the air in the cafe acquires heat from the fove, and the current becomes extremely brifk. When the manager perceives this, he removes the lamps, fhuts the valves, and opens the holes \(a, a, \& c\). beginning with the moft remote, and proceeding fowly towards the flove from each extremity of the horizontal branches. I'he heated air now iffues by thefe holes, glides along the ceiling below the galleries, and efcapes, by rifing up along the fronts of the galleries, and will be fenfibly felt by thofe fitting there, coming on their faces with a gentle warmth. It will then rife (in great part) ftraight up, while fome of it will glide backwards, to the com. fort of thofe who fit behind.
'Ihe propriety of fhutting the valves of the upright trunks is evident. If they were left open, no air would come out by the holes \(a, a\), \&c.; but, on the contrary, the air would go in at thefe holes to fupply the current, and the fove be rendered ufelefs. The air delivered by thefe holes will keep clofe to the ceiling, and will not, as we imagine, incommode thofe who fit below the galleries. But if it fhould be found to render thele parts too warm, holes may be pierced through the ceiling, by which it will rife among the people above, and mult be very comfortable. It will require the careful attertion of fome intelligent perfon to bring all this into a proper train at firf, by finding the proper apertures of the different holes, fo as to render the lieat equable through the whole fpace. But this being once alcertained the difficulty is over.

The air trunks mult be very capacious, but may be contracted towards the extremities as their lateral difo charges diminifh; and the row of holes which admit the air to the cafe round the fove mult be fully able to fupply them.

It mult be obferved, that in this conflruction the afcenfional force is but fmall. It is only the height of a fhort column of warm air from the ground to the galleries. At firft indeed it is great, having the unlimited height of the perpendicular trunks at X and Z ; but during the ufe of the tove it is reduced to nine or ten feet. It is neceffary, therefore, that the ftove be highly heated, perhaps coniderably beyond the Kuffian practice, but yet inferior to the leeat of the German iron foves. But ftill we Itrongly recommend the brick or pottery ftoves, on accouni of the wholefone fweetnefs of the air which they furnifh; and we are certain that a ftove of moderate dimenfions, eight feet long, for inftance, by eight feet higli, will be lufficient for warming a church holding 1200 or 1500 people. If the flove could be placed lower, which in many fituations is very practicable, its effect would be proportionally greater, becaufe all depends on the rapidity of the current. When we are limited in height, we mult extend the fove fo much the more in length, and make the air trunks more capacious. Thefe and many other circumftances of local modification muft be attended to by the erector of the flove; and without the judicious attention of an intelligent artift, we may expect nothing but difappointment. It is hardly poffible to give in. ftructions fuited to every fituation; but a careful attention to the general principle which determines the afcenfional force will free the artift from any great rifk of
failure.

\section*{S T O [ 819] S T O}

We may fay the fame thing of ftoves for confervatories, hot houles, hot walls, \&c. and can hardly add any thing of confequence to what we have already faid on thefe heads in the article Pneumatics.

We muft not, however, difmifs the fubject without taking notice of the very fpecious projects which have been frequently offered for drying malt by ftoves. Many of thefe are to be feen in the publications of the Academies of Stockholm, Upfal, Copenhagen, and fome have been erected in this kingdom; but they have not been found to anfwer.

We apprehend that they cannot anfwer. To dry malt, and make it fit for the ales and beers for which this ifland is fo famons, it is by no means enough that we give it a proper and an equable fupply of heat. This alone would bake it and make it flinty, caufing the moifture to penetrate the mealy particles of the grain; and, by completely diffolving the foluble parts, would render each kernel an uniform mafs, which would dry into a fliuty grain, breaking like a piece of glafs. A grain of malt is not an inert pulp. Tt is a sEED, in an active ftate, growing, and of an organized ftructure. We with to fop it in this ftate, and kill it, not by heating it, but by abflracting its moifture. We thus leave it in its granulated or organized form, fpungy, and fit for imbibing water in the mafh tub, without running into a pafte.
'To accomplifh thefe purpofes, the conftriction of our malt kilns feems very well adapted. The kiln is the only flue of the furnace, and a copious current of air is formed through among the grains, carrying off with it the water which is evaporating by the heat. But this evaporation, being chiefly in confequence of the vapour being immediately diffolved by the paffing air, will fop as foon as the current of air ftops. "This current has to make its way through moift grain, laid in a pretty thick bed, and matted together. Sorme force, therefore, is neceflary to drive it through. This is furnifhed by the draught of the kiln. Subftituting a fove, immediately applied to the malt, will not have this effect. The only way in which we think this can be done different from the prefent, is to have a horizontal flue, as has been propofed in thefe projects, fpread out at a fmall diftance below the grate on which the malt is laid, and to cover the whole with a high dome, like a glafs houfe dome. This being filled with a tall column of hot air, and having no paffage into it but through the malt, would produce the current which we want. We are convinced that this will make much lefs fuel ferve ; but we are by no means certain that the fulphureous and carbonic acid which accompanies the air in our common kiln is not a neceffary or a ufeful ingredient in the procefs. It is well known that different coaks, cinders, or charcoals, impart different qualities to the malts, and are preferred each for its own purpofe. Were this a matter of indifference, we know a method of rapidly drying malt much more economical and expelitious than by either kiln or fove. But this has nothing to do with our prefent fubject, of which we now take leave.

S'IOURBRIDGE, or STurbich, the name of a field near Cambridge, noted for its famous fair kept annually on the 7 th of September, and which continues for a fortnight. The commodities are, horfes, hops, iron, wool, leather, cheefe, \&c. This place is alfo noted for \(2 n\) excellent fpecies of clay capable of refilt.
ing an intenfe heat. It is ufed in making pots for glafs-houfes, fire-bricks, \&c. and is fold at an high price.

S YOW, the name of a market-town in Cloucefterfhire in England, fituated in W. Long. I. 50. N. Lat. 51. 54. It is alfo the name of a fine feat of the Marquis of Buckingham in Buckinghamife. Here are the belt gardens in England, adorned with bufts, ftatues, obelifks, pavilions, and temples. It is two miles from the town of Buckingham.
STOW (John), the induftrious hiftorian, fon of Thomas Stow merehant-taylor of St Michael's, Cornhill, in Loordon, was born about the year 1525 . Of the early part of his life we know wery little, except that he was bred to his father's bufinefs, which in the year 1560 he relinquifhed, devoting himfelf entirely to the ftudy of our ancient hiftorians, chronicles, annâls, charters, regitters, and records. Of thefe he made a confiderable collection, travelling for that purpofe to different parts of the kingdom, and tranfcribing fuch manufcrip s as lie could not purchafe. But this profeffion of an antiquary being attended with no prefent emolument, he was obliged for fubfiftence to return to his trade.It happened, however, that his talents and neceffities were made known to Dr Parker archbifhop of Canterbury; who being himfelf an antiquary, encouraged and enabled Mr Stow to profecute his darling ftudy. In thofe times of perfecution, thourh Elizabeth was then upon the throne, honeit Jolin Stow did not efcape danger. His collection of Popifh records was deemed caufe of fufpicion. His younger brother Thomas preferred no lefs than 140 articles againft him before the ecclefiaftical commiffion; but the proof being infufficient, he was acquitted. In 1565 he firft publifhed his Summary of the Chronicles of England. Abour the year \(15^{8}+\) he began his Survey of London. In 1585 he was one of the two collecters for a great mufter of Limeftreet ward: in the fame year he petitioned the corporation of London to beftow on him the benefit of two freemen, to enable him to publifh his furvey; and in 1589 he petitioned again for a penfion. Whether he fucceeded, is not known. He was principally concerned in the fecond edition of Holinhed's chronicle, publifhed in \(158 \%\). He alfo corrected, and twice augmented, Chaucer's works, publifhed in 1561 and in \(159 \%^{\circ}\) His furvey of London was firt publifhed in 1598. To thefe laborious works he would have added his large Chronicle, or Hiftory of England; but he lived only to publifh an abttract of it, under the title of Flores Hiftoriarum. The folio volume, which was printed atter his death, with the title of Stow's Chronicle, was taken from his papers by Edmund Howes. Having thus fpent his life and forture in thefe laborious purfuits, he was at laft obliged to folicit the charitable and well difpofed for relief. For this purpofe, king James I. granted him, in 1603 ; a brief, which was renewed in 1604, authorifing him to collect in churches the benefactions of his fellow-citizens. He died in A pril 1605, aged 80; and was buried in his parih-church of St Andrew's, Underfaft, where his widow erected a decent monument to his memory. John Stow was a moft indefatigable antiquarian, a faithful hiftoriain, and an honeft man.

STOWMARKET, a town of Suffolk, in England, frituated in E. Long. 1. 6. N. Lat. 52.16. It is a large
hand-

\section*{S T R [ \(\left.\mathrm{S} 20^{\mathrm{L}}\right] \quad \mathrm{S}\) T I}
handfome place, fituated between the branches of the rivers Gypping and .Orwell, and is remarkable for having the beft cherries in England.

STOWAGE, the general difpofition of the Ceveral materials contained in a fhip's hold, with regard to their figure, magnitude, or folidity.
In the ftowaye of different articles, as ballaft, cafks, cafes, bales, and boxes, there are feveral general rules to be offerved, according to the circumftances or qualities of thofe materials. The cafks which contain any liquid are, according to the fea phrafe, to be lung rup and libige.free, i. e. clofcly wedged up in an horizontal pofition, and refting on their quarters: fo that the bilges where they are thickelt being entirely free all round, cannot rub againit each other by the motion of the vef. fel. Dry goods, or fuch as may be damaged by the water, are to be carefully inclofed in calks, bales, cafes, or wrappers; and wedged off from the bottom and fides of the thip, as well as from the bow, mafts, and pumpwell. Due attention mult likewife be had to their difpolition with regard to each other, and to the trim and centre of gravity of the fhip; fo that the heavieft may always be neareft the keel, and the lighteft gradually above them.

S'TRABISMUS, fquinting. Sce MEdicine-Index.

STRABO, a celebrated Greek geographer, philofopher, and hiftorian, was born at Amafia, and was defçended from a family fettled at Gnoffus in Crete. He was the difciple of Xenarchus, a Peripatetic philofopher, and at length attached himfelf to thie stoics. He contracted a trict friendfhip with Cornelius Gallus, governor of \(\mathrm{E}_{\text {ypt }}\), and travelled into feveral countries to obferve the fituation of places, and the cuftoms of nations. He flourifhed under Angrultus, and died under Tiberius about the year 25 , in a very advanced age. He compoled feveral works, all of which are lott except his Geography in 17 books; which are juftly efteemed very precious remains of antiquity. The two firft books are employed in fhowing, that the fudy of geography is not only worthy of, but even neceffary to, a philofopher; the third defcribes Spain; the fourth, Gaul and the Britannic ifles; the fifth and fixth, Italy and the adjacent ines; the feventh, which is imperfect at the end, Germany, the countries of the Getre and Illyrii, \({ }^{-}\)Taurica Cherfonefus, and Epirus; the eighth, minth, and tenth, Greece with the neighbouring ifles; the four following, Alia within Mount 'laurus; the fi'tecnth and fixteenth, Afia without Taurus, India, Perfia, Syria, Arabia; and the feventeenth, Egypt, Aithiopia, Carthaoe, and other places of Africa. Strabo's work was publifhed with a Latin verfion by Xy lander, and notes by Ifaac Cafaubon (or rather by Jenry Scrimzeer, from whom Cafaubon chiefly fole them), at Paris, 1620 , in folio. But the beft edition is that of Amfterdam in 1707, in two volumes folio, by the learned Theodore Janfonius ab Almelooveen, with the entire notes of Xylander, Cafaubon, Meurfus, Cluver, Holftenius, Salmafius, Bochart, Ez. Spanheim, Cellarius, and others. 'I'o this edition is fubjoined the C.brefomath: or or epitome of Strabo; which according to Mr Dodwell, who has written a very elaborate and learned differtation about it, was made by fome unknown perfon between the years of Chrift 676 and 996 . It has been found of fome ufe, not only in helping to correct the original, but in fupplying in fome meafure the
defect in the feventh book. Mr Dodwell's differtation is prefixed to this edition.

Strada,
STRADA (Famianus), a very ingenious and le \(\quad\) rned Jefuit, was born at Rome the latter end of the 16 th century, and tanght rhetoric there, in a public manner, for fifteen years. He wrote feveral pieces upon the art of oratory, and publiffed fome orations with a view of illuftrating by example what he had inculcated by precept. But his Prolyfiones Academica and his Hifloria de Bello Belgico are the works which raifed his reputation, and have preferved his memory. His hitory of the war of Flanders was publifhed at Rome; the firlt decad in 1642 , the fecond in 647 ; the whole extending from the death of Charles V. which happened in 1558 , to the year 1590 . It is written in good Latin, as all allow; but its merit irs other refpects has been varioully determined. His Prolufiones Academica fhow great ingenuity, and a matherly fkill in claffical literature ; that prolufion efpecially in which he introduces Lucan, Luctetiua, Claudian, Ovid, Statius, and Virgil, each of them verfitying according to lis own ftrain. They have been often pinted. We know not the year of Strada's birth or of his death.

ST'RAHAN (William), an eminent printer, was born at Edinburgh in the year 1715. His father, who had a fmall appointment in the cuftoms, gave his fon the education which every one of decent rank then receised in a country where the avenues to learning were eafy, and open to men of the moft moderate circumitances. After having paffed through the tuition of a grammar fchool, he was put apprentice to a printer; and when a very young man, removed to a wider fphere in that line of bufinefs, and went to follow his trade in London. Sober, diligent, and attentive, while lis emoluments were for fome time very fcanty, he contrived to live rather within than beyond his income; and though he married early, and without fuch a provifion as prudence inight have looked for in the eftablifhment of a family, he continued to thrive, and to better his circumftances. This he would often mention as an encouragement to early matrimony; and ufed to fay, that he never had a child born that Providence did not fend fome increafe of income to provide for the increafe of his houfehold. With fufficient vigour of mind, he had that happy flow of animal ipirits that is not cafily difcouraged by unpromifing appearances.

His abilities in his profeffion, accompanied with perfect integrity and unabating diligence, enabled him, after the firt difficulties were overcome, to advance with rapid fuccefs. And he was one of the moft flourifhing men of the trade, when, in the year 1770, he purchafed a fhare of the patent for king's printer of Mr Eyre, with whom he maintained the mot cordial intimacy during the reft of his life. Befide the emoluments arifing from this appointment, as well as from a very extenfive private bufinefs, he now drew largely from a field which required fome degree of feculative fagacity to cultivate on account of the great literary property which he acquired by purchafing the copy-rights of the moft celebrated authors of the time. In this his liberalicy kept equal pace with his prudence, and in fome cafes went perliaps rather beyond it. Never had fuch rewards been given to the labours of literary men as now were received from him and his affociates in thofe pur. chafes of copy-rights from authors.

\section*{S TR}

Having now attained the firf great object of buftnefs, wealth, Mr Strahan looked with a very allowable ambition on the ftations of political rank and cminence. Politics had long occupied his active mind, which he had for many years purfued as lis favourite amufement, by correfponding on that fubjeet with fome of the firft characters of the age. Mr Strahan's queries to Dr Franklin in the year 3769 , refpecting the difcontents of the Americans, publifhed in the London Chronicle of 28 th July 1778 , fhow the jult conception lie entertained of the important confequences of that difpute, and his anxiety as a good fubject to inveftigate, at that early period, the proper means by which their'grie. vances might be removed, and a permanent harmony reflored between the two countries., In the year 1775 he was clected a member of parliament for the borough of Malnßury in Wilthire, with a very illuftrious colleague, the Hon. C. J Fox; and in the fucceeding parliament, for Wootton Baffet, in the fame county. In this ftation, applying liinfelf with that indultry which was natural to him, he was a uffeful member, and attended the houfe with a ferupulous punctuality. ilis talents for bufinefs acquired the confideration to which they were intitled, and were not unnoticed by the minifter.

In his political connections he was conftant to the friends to whom he had firft been attached. He was
fteady fupporter of that party who were turned out of adminiftration in fpring \({ }^{1784}\), and loft his feat in the houfe of commons by the diffolution of parliament with which that change was followed: a fituation which he did not fhow any defire to refume on the return of the new parliament; arifing from a feeling of fome decline in his health, which had rather fuffered from the lone fittings and late hours with which the political warfare in the precedins had been attended. Without any fixed difeafe, his flrength vifibly declined; and though his fpirits furvived his ftrength, yet the vigour and activity of his mind were alfo confiderably impared. Doth continued gradually to decline till his death,' which happened on the 9 th of July 1785 in the 71 ft year of his agc.

Endued with much natural fagacity, and an attentive ebfervation of life, he owed his rife to that ftation of opulence and refpect which he attained, rather to his own talents and exertion, than to any accidental occurrence of favourable or fortunate circumftances. His mind was not uninformed by letters; and from a habit of attention to ftyle, he acquired a contiderable portion of critical acutenefs in the difcernment of its beauties and defects. In one branch of writing he particularly excelled - the epiftolary ; in which he not only fhowed the precifion and clearnefs of buinefs, but poffeffed a neatnefs as well as a fluency of expreffion which few let-ter-writers have been known to furpafs. Letter-writing was one of his favourite amufements; and among liis correfpondents were men of fuch eminence and talents as well repaid his endeavours to entertain them. Among thefe, as before-mentinned, was the jufly celebrated Dr Iranklin, originally a printer like Mr Strahan, whofe friendfhip and correfpondence, notwithtanding the cifference of their fentiments in political matters, he continued to enjoy till his death. One of the lateft letters which he received from his illuftrious and verecable friend, contained a humorous allegory of the Itate

\section*{S. T R}
of politics in Britain, drawn from the profeffion of print. Straham: iner ; of which, thongh the Doctor had quitted the excrcife, he had not forgotten the terms.

The judicious difpolition which Mr Strahan made of his property, affords an evident proof of his good fenfe and propriety. After providing munificently for his widow and childern, his principal ftudy feems to have been to mitigatc the affiction of thofe (and many there were) who would more immediately have felt his lefs, by bequeathing them liberal annuities for their lives; and (recollecting that all of a profeffion are not equally provident) he left 1000 l. to the Company of Stationers, the intereft to be divided among infirn old printers.

As the virtwous connections of the life and the heart are always pleafing to trace - of Mr Strahan it may briefly be faid, that his capacity, diligence, and probity, raifed him to the head of his profeftion. The good humour and obliging difpofition which he owed to nature, he cultivated with care, and confirmed by habit. His fympathetic leeart beat time to the joy and forrow of his friends. His advice was always ready to direct youth, and his purfe open to relieve indigence. Living in times not the pureft in the Englifh annals, he efcaped unfullied through the artifices of trace and the corruption of politics. In him a ftrong matural fagacity, improved by an extenfive knowledge of the world, ferved only to render refpectable his unaffected fimplicity of manners, and to make his Chriftian philanthropy more difcerning and ufeful. The uninterrupted health and happinefs which accompained him for half a century in the capital, proves honefty to be the beft policy, temperance the greateft luxury, and the effential duties of life its moft asreeable amufement. In his elevated. fortune, none of lis former acquaintance ever accufed him of neglect. He attained profperity without envy \({ }_{s}\) enjoyed wealth without pride, and difpenfed bounty withont offentation.

STRAIKS, in the military art, are Atrong plates of iron, fix in number, fixed with large nails called fraiknails, on the circumference of a cannon-wheel, over the joints, of the fellows; both to ftrengthen the wheel, and to fave the fellows from wearing on hard ways or ftrects.

STRAIN, a pain occafioned by the violent extenfion: of fome membranous or tendinous part.

Strain, Strefs, in mechanics, are terms indifcriminately ufed to exprels the force which is excited in any part of a machine or ftructure of any kind tending to break it in that part. Thus every part of a rope is equally Atrained by the weight which it fufpends. Every part of a pillar is equally frained by the load which it fup,ports. A mill axle is equally twifted and ftrained in every part which lies between the part of the wheel actuated by the moving power and the part which is refifted by the work to be performed. Every part of a lever or joift is differentiy ftrained by a force acting on a diftant part.

It is evident that we cannot make the ftructure fit for its purpofe, unlefs the ttrength in every part be at lealt equal to the ftefs laid on, or the ftrain excited in that part. It is no lefs plain, that if we are ignorant of the principles which determine this ftrain, botli in intenfity and direction, in relation to the magnitude and, the fituation of its remote caufe, the only fecurity we have for fuccefs is to give to every part of the affem.

\section*{S T R}

\section*{S TR}
blage fuch folidity that we can leave no doubt of its fuf. ficiency. But daily experience fhows us that this vague fecurity is in many cafes uncertain, if wc are thus ignorant. In all cales it is flovenly, unlike an artift, attended with ufelefs expence, and in machines is attended with a lofs of power which is wafted in changing the motions of a needlefs load of matter.

It muft therefore greatly tend to the improvement of all profeffions occupied in the erection or employment of fuch fructures to have a diftinet notion of the ftrains to which their parts are expofed. Frequently, nay generally, thefe ffrains are not immediate, but arife from the action of forces on diftant parts, by which the affemblage is ftrained, and there is a tendency to rupture in every part. \This ftrain is induced on every part, and is there modified by fixed mechanical laws. Thefe it is our bufinefs to learn ; but our chief object in this inveftigation is to deternine the ftrength of materials which it is neceffary to oppofe in every part to this ftrain; and how to oppofe this ftrength in fuch a manner that it thall be exerted to the beft advantage. The notions of ftrain and ftength therefore hardly admit of feparation; for it is even by means of the ftrength of the intermediate parts that the ftrain is propagated to, or excited in, the part under confideration. It is proper therefore to confider the whole together underthe article \(S_{T R E N G T H}\) of Materials in mechanics.

STRAINING, is the clarification of a liquor, by paffing it through a fieve or filter. The word is derived from the French, effreindre; which is formed from ex, " out of," and firingere, "to prefs."

STRAIT, a narrow channel or arm of the fea, fhut up between lands on either fide, and affording a paffage out of one great fea into another.

There are three kinds of ftraits. 1. Such as join one ocean to another. Of this kind are the ftraits of Magellan and Le Maire. 2. Thofe wlich join the ocean to a gulf: the ftraits of Cibraltar and Babelman. del are of this kind, the Mediterranean and Red Sea being only large gulfs. 3. Thofe which join one gulf to another; as the flraits of Caffa, which join the Palus Mrotis to the Euxine or Black Sea. The paffage of ftraits is commonly dangerous, on account of the repidity and oppofite motion of currents. The moft celebrated flrait in the world is that of Gibraltar, which is about from 24 to 36 miles long, and from 15 to 24 broad, joining the Mediterranean fea with the Atlantic occan. The ftraits of Ma;rellan, difco. vered in 1520 by F. Magellan, were ufed fome time as a paffage out of the North into the South Sea; but fince the year 1616 , that the ftrait of Le Maire has been difcovered, the former has been difufed; both becaufe of its length, which is full three hundred miles, and becaufe the navigation thereof is very dangerous, from the waves of the North and South Seas meeting in it and clafing. The frait at the entrance of the Baltic is called the Sound. That between England and France, Le fas de Calais, or the Cbannel. There are alfo the ftraits of Weigats, of Jeffo, of Anian, of Davis, and Hudfon, \&c.

STRAKES, or Streaks, in a hhip, the uniform
ranges of planks on the bottom and fides of a fhip, or the continuation of planks joined to the ends of each other, and reaching from the ftem to the ftern-poft and fafthion-pieces; the loweft of thefe, which is called the garboard-freak, is let into the keel below, and into the ftem and ftern-poft. They fay alfo a fhip beels a frake, that is, hangs or inclines to one fide the quantity of a whole plank's breadth.
Strakes, or Areks, in mining, are frames of boards fixed on or in the ground, where they walh and drefs the fmall ore in a little ftream of water, hence called Araked ore.

STRALSUND, a ftrong and rich fea-port town of Germany, in Hither Pomerania, and was formerly an important trading. place. In 1678 it was forced to furrender to the elector of Brandenburg, atter 1800 houfes had been burnt to ahhes in one night's time. After this the Swedes defended it to the laft extremity; and Charles XII. in 1714, came hither after its return out of Turkey. But the crown of Sweden not being able to hold out againft five great powers, it was forced to fubmit in 1715 . In 1720 it was rendered back to Sweden, but in a very poor condition. It is almoit furrounded by the fea and the lake Francen, and has a harbour feparated from the ifle of Rugen by a narrow ftrait. It is 15 miles north-weft of Gripprwald, and 40 northeaft of Guftrow. E. Long. 13.28. N. Lat, 54. 17.

STRAMONIUM, in botany ; a fpecies of DatuRA.

STRAND (Saxon), any fhore or bank of a fea or great river. Hence the ftreet in the weft fububs of London, which lay next the flore or bank of the 'hamee, was called the Strand. An immunity from cuftom, and all impofitions upon goods or vefels by land or water, was ufually expreffed by frand or fream.
STRANDED (from the Saxon frand), is when a Ship is by tempeft, or by ill fterage, run on ground, and fo perifhes. Where a veffel is ftranded, jultices of the peace, \&c. fhall command conftables near the feacoafts to call affiftance for the prefervation of the fhip; and officers of men of war are to be aiding and affifting thereto.
S'RANGE (Sir Robert), who carried the art of engraving to fo great perfection in this country, was a man of fuch general merit, that a life of him, not merely eftimating his character as an artift, but alfo pourtraying his private virtues and eomeftic habits, would be both ufeful aud entertaining. Such a life, we have reafon to believe, will be prefented to the public. Modeft as he was ingenious, he ufed indeed to fay that the works of an aititt fhould ferve for a life and monument to him. His works no doubt will perpetuate his name whilft any tafte for the fine arts remains. In the mean time, we cannot but here give a fhort fketch of his hiftory; the accuracy of which may be depended on.

Sir Robert Strange was born in the ifland of Pomona in Orkney, July the 14th 1721; and died at London July the 5 th 1792 . He was lineally defcended fiom David Strange or Strang, a younger fon of the family of the Stranges or Strangs (A) of Balcafky, in the coun-

Surakes
Strange

\section*{S T H [823] S T R}

Strange. \(t y\) of Fife, who fettled in Orkney at the time of the Reformation. But as there were no males remaining of the elder branch of the Stranges of Balcafky, Sir Robert became the male reprefentative of it, and was found by a legal inveftigation to have a right to the armorial bearings and every other mark of honour belonging to that ancient family:
He receeived his clafical education at Kirkwall in Orkney under the care of a learned, worthy, and much refpected gentleman, Mr Murdoch Mackenzie, till alive (1795), who has rendered infinite fervice to his country by the accurate furveys and charts he has given of the iflands of Orkney and of the Britifh and Irifh coafts.

Originally intended for the law, Mr Strange foon became tired of that profeffion, and perceived that his genius decifively led him to the arts of drawing and engraving. For this purpofe he was introduced to the late Mr Richard Cooper at Edinburgh, the only perfon there who had then any tafte in that line of the fine arts. He was bound with him as an apprentice for fix years; during which time he made fuch progrefs in his new profeffion, that his friends entertained the ligheft expectation of his fuccefs; nor were they difappointed.
In the year 1747 he married Ifabella, only laugh. ter of William Lumifden, fon of Bifhop I.umifden; and foon after his marriage he went to France, where with the moft ardent application he profecuted his ftudies, chiefly at Paris, under the direction of the celebrated Le Bas, who engraved many excellent prints from the Dutch painters. It was from Le Bas he had the firt hint of the ufe of the inftrument commonly called the dry needle; but which he afterwards greatly improved by his own genius, and which has added fuch fuperior beauties to his engravings.
In the year \(175^{1} \mathrm{Mr}\) Strange removed with his family from Edinburgh and fettled at London, where he engraved feveral fine hiftorical prints, which jufly acquired to him great reputation. At this period hiftorical engraving had made little progrefs in Britain, and he may be properly confidered as its father.
The admiration hc always had for the works of the great Italian painters made him long defire to vifit ItaIy, the feat ot the fine arts; and the farther he advanced in life, he became the more perfuaded that a journey to that country was effential to an artift who had the laudablé ambition to excel in his profeffion. He therefore undertook this journey in the year 1760 . In Italy he made many admirable drawings, feveral of whicl he afterwards engraved. Thefe drawings are now in the poffeffion of Lord Dundas.

Everywhere in Italy fingular marks of attention were beftowed on Mr Strange; not only by great perfo: nages, but by the principal academies of the fine arts in that country. He was made a member of the academies of Rome, Florence, and Bologna, and profeffor in the royal academy at Parma.
To fhow the eftimation in which his talents were held
at Rome, we cannot but record the following aneedote. Strange, The ceiling of the room of the Vatican library, in which the collection of engravings are kept, is elegantly painted by Signor Rotfanelli. It reprefents the progrefs of engraving; and the portraits of the moft eminent artits in that line are there introduced, among which is thăt of our artiff. Under his arm he holds a portfolio, on which his name is infcribed. He is the only Britifh artift on whom this honour has been conferred.
In France, where he refided many years at different periods, his talents likewife received every mark of attention that could be beftowed on a foreigner. He was made a member of the royal academy of painting
at Paris.

His majefty King George III, ever attentive to the progrefs of the fine arts in Britain, and fenfible of the advantages of which engraving particularly has been to this country, even in a commercial light; and defirous to give a mark of his royal approbation of the merit of Mr Strange, whom he confidered as at the head of his profeffion and the great improver of it-was gracioufly pleafed to confer the honour of knighthood on him the 5 th of January \({ }^{17} 87\).
Such was Sir Robert Strange as an artit; nor was he lefs diftinguifhed by his truly amiable moral qualities, which endeared him to all who had the happinefs
to know him.
With regard to his works, he left fifty capital plates, ftill in good condition, which are carefully preferved in his family. They are engraved from pictures by the moft celebrated painters of the Roman, Florentine, Lombard, Venetian, and other fchools. They are hiflorical, both facred and profane, poetical, allegorical.
From his tarlieft eftablifhment in life, Sir Robert carefully preferved about eighty copies of the fineft and moft choice impreffions of each plate he engraved; which, from length of time, have acquired a beauty, mellownefs, and brilliaucy, eafier feen than defcribed. He did this with a view of prefenting them to the public at a period when age fhould difable him from adding to their number. Thefe he collected into as many volumes, and arranyed them in the order in which they werc engraved. To each volume he prefixed two portraits of himfelf, on the fame plate, the one an etching, the other a finithed proof, from a drawing by John Baptifte Greufe. 'This is the laft plate he engraved; and which is a proof that neither his eyes nor hand were impaired by age. It likewife thows the ufe he made both of aquafortis and the graver. Each volume, befides a dedication to the king, contains an introduction on the progrefs of engraving, and critical remarks on the pictures from which his engravings are taken. Thefe volumes were ready to be given to the public, when Sir Robert's death and confequent circumftances delayed this magnificent publication; a publication which does fo much honour to the arcift, and to the country which gave him birth (B)

STRANGER,
(B) Solicitous to make all our biographical articles the vehicles of truth, and particularly defirous to do juftice to the memory of our illuftrious countryman Sir Robert Strange, we applied for information refpecting him to the perfon whom we confidered as the moft capable of furnifhing it, and to whom we imagined that our application would be in a high degree grateful. With fome difficulty we obtained, as a favour to ourfelves, the fleetch

\section*{S T R}

town-houle, and the cathedral. It has a wooden bridge St"afbur bo
exmget STRANGER, in law, denotes a perfon who is not II Straibutg privy or party to an act. Thus a ftranger to a judgement is he to whom a judgment does not belong; in which fenfe the word ftands direety oppofed to party or privy.

Strangles, in Farriery. See that article, § xiv.

SPRANGURY, a fupprefion of urine. See MEDICINE, Ho 119

STRAP, among furgeons, a fort of band ufed to f.etch out limbs in the fetting of broken or disjointed bones.

Strat, in a fhip, the rope which is fpliced about any block, and made with an cye to taften it any where on
* occafion.

Straps, in the manege. The ftraps of a faddle are finall leather ftraps, nailed to the bows of the facdle, with which we make the girths falt to the faddle.

STRAPADO, or Strappado, a kind of military punifbment, wherein the criminals hands being tied behind him , he is hoifted \(\mu \mathrm{p}\) with a rope to the top of a long piece of wood, and let fall again almoft to the ground; fo that, by the weight of his body in the fhock, his arms are diflocated. Sometimes he is to undergo three ftrapadues or more.

ST'R ASBURG, an ancient, large, handfome, popisłous, and Itrong city of France in Alface. It contains about 200 ftreets, part of which are very narrow, and molt of the houfes are built after the ancient tafte. E- Iowever, there are a great number of handiome buildings, fuch as the hotel of the marfal of France, who is commander of the city ; the hotel of the cardinal of Rouen, the bifhops palace, the Jefuits college, the royal hofpital, the hotel of Heffe-Darmftadt, the arfenal, the
over the Rhine, which is thought to be one of the firmet in Europe; as is likewife the cathedral church, whofe tower is the handfomelt in Germany, and the clock is greatly admired by all travellers. Some look npen it as one of the wonders of the world, and the fteeple is allowed to be the higheft in Europe. The clock not only fhows the hours of the day, but the motion of the fun, moon, and ftars. Among other things there is air angel, which turns an hour-glafs every hour; and the twelve apoftles proclaim noon, by each of them ftriking a blow with a hammer on a bell. There is likewife a cock, which is a piece of clock-work, that crows every hour. There are 700 fteps up to the tower or fteeple, it being 500 feet high. It was a free and imperial city; but the king of France became mafter of it in 168 r , and greatly augmented the fortifications, though before it had as many cannon as there are days in the year. The inhabitants were formerly Proteftants, and carried on a great trade; but moft of them have been oblised to embrace the Romifh fuperfition, though there is ftill a fort of toleration. Such was Strafburg before the French revolution ; what it is now we have not leifure to inquire. It is feated on the river Ill, 55 miles north of Bafil, 112 fouth-wett of Mientz, and 255 ealt. of Paris. E. Long. 7. 51. N. Lat. 48. 35.

STRATA, in natural hiltory, the feveral beds ar. layers of different matters whereof the earth is compo. fed. See Quarry.

The ftrata whereof the earth is compofed are fo very different in different countrics, that it is impofisble to fay any thing concerning them that may be generally applicable : and inceed the depths to which we can penetrate are fo finall, that only a very few can be known
of his life, which we have laid before onr readers, upon the exprefs condition that we fhould not alter a fingle word of it ; as the compofition, we were told, would do bonour to our work. We have obferved the condition, and therefore cannot claim this honour to any of the'ufual writers in the Encyclopædia Britannica. - If Sir Robert's more intimate friends fhall be pleafed with the article, their gratitude will be due not to us, but to fome of his neareft relations; and what may appear its defects to others (for the taltes of mankind are very different), we sruft will be fupplied by the following authentic catalogue of his works: Plate 1. Two Heads of the author-one an etching, the other a. finifhed proof, frone a drawing by John Baptifte Greufe; 2. The Return from Market, by Wouvermans ; 3. Cupid, by Vanloo; 4. Mary Magdalen, by Guido ; 5. Cleopatra, by the fame; 6. The Madonna, by the fame; 7. The Angel Gabriel, by the fame; 8. The Virgin, holding in her hand a book, and attended by angels, by Carlo Maratt ; 9. The Virgin with the Child afleep, by the fame ; 10. Liberality and Modefty, by Guido ; 11. Apollo rewarding Merit and punifhing Arrogance, by Andrea Sacchi; J2. The Finding of Romulus and Renıus, by Pietro da Cortona; 13. Cæfar repudiating Pompeia, by the fame; 14. Three Childuren of King Charles I. by Vandyke; 15. Belifarius, by Salvator Rofa; 16. St Agnes, by Dominichino; 17. The Judgment of Hercules, by Nicolas Pouffin; 18. Venus attired by the Graces, by Guido; 19 and 20. Juftice and Mecknefs, by Raphael; 21. The Offspring of Love, by Guido; 22. Cupid fleepiny, by the fame; 23. Abraham giving up the Handmaid Hagar, by Guercino; 24. Ether a Suppliant before Ahafuerus, by the fame; 25. Jofeph and Potiphar's Wife, by Guido; 26. Venus Blinding Cupid, by Titian; 27. Venus, by the fame; 28. Danae, by the fame; 29. Portrait of King Charles I. by Vandyke; 30. The Madonna, by Correggio ; 31. St Cæcilia, by Raphael ; 32. Mary Magdalen, by Guido ; 33. Our Saviour appearing to his Mother after his Refurrection, by Guercino; 34. A Mother and Child, by Parmegiano ; 35. Cupid Meditating, by Schidoni ; 36. Laomedon King of Troy detected by Neptune and Apollo, by Salvator Rofa; 37. The Death of Dido, by Cuercino ; 38. Venus and Adonis, by Titian; 30. Fortune, by Guido; 40. Cleopatra, by the fame; 41. Two Childrea at School, by Schidoni; 42. Mary Magdalen, by Correggio; 43. Portrait of King Charles I. attended by the Marquis of Hamilton, by Vandyke; 44. Queen Henrietta, attended by the Prince of Wales, and holding in her Arms the Duke of York, by the fame; 45. Apotheofis of the Royal Children, by Wett; 46 .' 1 he Annunciation, by Guido ; 47. Portrait of Raphael Saacio D’Urbino, by himfelf; 4h. Sappho, by Carlo Dolci ; 49. Our Saviour afleep, by Vandyke ; 50. St John in the Defert, by Murilla.

\section*{S T R}
to us at any rate; thofe that lie near the centre, or even a great way from it, being for ever hid. One reafon why we cannot penetrate to any great depth is, that as we go down the air becomes foul, loaded with pernicious vapours, inflammable air, fixed air, \&e. which de. ftroy the miners, and there is no poffibility of going on. In many places, however, thefe vapours become pernicious much fooner than in others, particularly where fulphureous minerals abound, as in mines of metal, coal, \(3 x c\).

But however great differences there may be among the under ftrata, the upper one is in fome refpects the fame all over the globe, at leaft in this refpect, that it is fit for the fupport of vegetables, which the others are not, without long expofire to the air. Properly fpeaking, indeed, the upper ftratum of the earth all round, is compofed of the pure vegetable mold, though in many places it is mixed with large quantities of ether ftrata, as clay, fand, gravel, \&c.; and hence proceed the differences of foils fo well known to thofe who practife agriculture.

It has been fuppofed, by fome naturalifts, that the cinicient ftrata of which the earth is compofed were originally formed at the creation, and lave continued in a manner imrautable ever fince: but this cannot pofAByy have been the cafe, fince we find that many of the ftrata are flrangely intermixed with each other; the bones of animals both marine and terreftrial are frequently found at great depths in the earth; beds of oyfter-fhells are found of immenfe extent in feveral countries ; and concerning thefe and other fhell-fifh, it is remarkable, that they are generally found much farther from the furface than the bones or teeth either of marine or terreftrial animals. Neither are the fhells or other remains of fifh found in thofe countries adjoining to the feas where they grow naturally, but in the moft diftant regions. Mr Whitehurf, in his Inquiry into the Original State and Formation of the Earth, has given the following account of many different kinds of animals, whofe fhells and other remains or exuvie are found in England; though at prefent the living animals are not to be found except in the Eaft and Weft Indies.

A Catalogue of Extraneous Fossils, Bowing where they were dug up; alfo their native Climates. Mofly feleged from the curious Cabinet of Mr Neilson, in King-freet, Red-Lion Square.

Nothing has more perplexed thofe who undertake to form theories of the earth than thefe appearances. Some have at once boldly afferted, from thefe and other phenomena, that the world is eternal. Others have had recourfe to the univerfal deluge. Some, among whom is the Count de Buffon, endeavour to prove that the ocean and dry land are perpetually changing places; that for many ages the higheft mountains have been covered with water, in confequence of which the marine animals juft mentioned were generated in fuch vaft quantities, that the waters will again cover thefe mountains, the habitable part of the earth become fea, and the fea become dry land as before, \&c. Others have imagined that they might be occafioned by volcanoes, earthquakes, \&c. which confound the different ftrata, and often intermix the productions of the fea with thore of the dry land.

I'hefe fubjects have been difcuffed under the article Earth, to which therefore we refer the reader; and fhall conclude with fome account of the ftrata in thofe places where they have been moft particularly obferved.

Under the article Natural History, Sect. I. it is obferved, that the upper ftrata of the earth and mountains generally confift of rag.ftone, the next of flate, the third of marble filled with petrifactions, the fourth again of flate, and the next of free.flone. But we are far from confidering this as a rule which holds univerfally. The ftrata differ exceedingly in a great number of places; fome inftances of which we fhall give from Mr Whitehurft. A Alfreton Common in Derbyhire, Enquiry ins. the frata are,

\(A\) Thble of the Strata at West Hallam.

Mr Forfter has given an account of fome of the ftrata of the South-Sea iflands, the fubftance of which may be feen in the following table.

> South Georgia.
I. No foil, except in a few crevices of the rocks.
2. Ponderous flate, with fome irony particles, in horizontal Arata, perpendicularly interfeeted with veins of quartz.

\section*{Southern Ifle of New Zealand.}
1. Fine light black mould, in fome places nine inches deep, but generally not fo much.
2. An argillaceous fubftance, nearly related to the clafs of 'l'alcons, turned into earth by the action of the air.
3. The fame fubftance farther indurated, in oblique ftrata, generally dipping to the fouth.

Easter Island.
1. Reddifh.brown dufty mould, looking as if it had been burnt.
2. Burnt rocks, refembling flags or drofs and other volcanic matters.

Marquesas.
1. Clay mixed with mould.
2. An earthy argillaceous fubftance mixed with tarras and puzzolana.

\section*{Otaheite.}

The fhores are coral rock, extending from the reef encircling thefe ifles to the very high water-mark.

There begins the fand, formed in fome places from fmall fhells and rubbed pieces of coral ; but in others the fhores are covered with blackifh fand, confifting of the former fort mixed with black, fometimes glittering, particles of mica, and here and there fome particles of the refractory iron ores called in England \(S_{K 1 m}\), the ferrum micaceum of Limnrus, and Kall the molybdienum fpuma lupi of the fame author. The plains from the ©hores to the foot of the hills are covered with a very fine thick fratum of black mould, mixed with the above-nentioned fand, which the natives manure with fhells. The firlt and lower range of hills are formed of a red octrreous earth, fometimes fo intenfely red, that the natives ufe it to paint their canoes and cloth. The higher hills confift of a hard, compact, and fliff clayey fublance, hardening into ftone when out of the reach of the fun and air. At the top of the valleys, along the banks of the rivers; are large maffes of coarfe granite ftones of various mixtures; in one place are pillars of \(a\) grey, folid bafaltes; and, in feveral others, fragments of black bafaltes.

Friendly Islands and New Hebrides
The fame with the above.
Mallicollo.
Yellowifh clay mixed with common fand.
Tanna, a Volcanic I/land.
The chief frata here are clay mixed with aluminous earth, interfperfed with lumps of pure chalk. 'The ftrata of the clay are about fix inches, deviating very little from the liorizontal line.

New Caledonia and the adjacent Iles.
The fhores confilt of fhell-fand, and particles of quartz; the foil in the plains a black mould mixed with this fand. The fides of the hills compofed of a yellow' ochreous clay, richly fpangled with fmall particles of cat-filver, or a whitifh kind of daze, the mica argenteca of Linnzus. The higher parts of the hills confift of a fone called by the German miners geffelfein, compofed of quartz and great lumps of the above catfilver. The latter is fometimes of an intenfely red or orange colour, by means of an iron ochre.
"From the above account, "fays Mr Forfter," it appears, I think, evidently, that all the high tropical ifles of the South Sea have been fubjeit to the action of volcanoes. Pyritical and fulphureous fubttances, together with a few iron-ftones, and fome veltiges of copper, are no doubt found in feveral of them: but the mountains of New Caledonia are the moft likely to contain the richent metallic veins; and the fame opinion, I fulpect, may be formed of the mountains in New Zealand."

In the city of Modena in Italy, and for fome miles round that place, there is the moft fingular arrangement of ftrata perhaps in the whole world. From the furface of the ground to the depth of 14 feet, they meet with nothing but the ruins of an ancient city. Being come to that depth, they find paved ftreets, artificers fhops, floors of houfes, and feveral pieces of inlaid work. After thefe ruins they find a very folid earth, which one would think had never been removed; but a little lower they find it black and marfhy, and full of briars. Signior Ramazzini in one place found a heap of wheat entire at the deptb of 24 feet; in another, he found flibert-

\section*{\(S \quad \mathrm{~T} R\)}

Strata filbert-irees with their nuts. At the eepth of about 28 feet, they find a bed of chalk, about I I feet deep, which cuts very eafily; after this a bed of marfhy earth of about two feet, mixed with rufhes, leaves, and branches. After this bed comes another of chalk, nearly of the fame thickners; and which ends at the depth of 42 feet. 'I'his is followed by another bed of marfly carth like the former; after which comes a new chalk-bed, but thinner, which alfo has a marfhy bed uuderneath it. 'This ends at the depth of 63 feet; after which they find fand mingled with fmall gravel, and feveral marine fhells. 'This itratum is ufually about five feet deep, and underneath it is a vaft refervoir of water. It is on account of this water that the foil is fo frequently dug, and the ftrata fo well known in this part of the world. After cominy to the fandy bottom above-mentioned, the workmen pierce the ground with a terebra or auger, when the water immediately fprings up with great force, and fills the well to the brini. 'T'he flow is perpetual, and neither increales by rain, nor decreafes by drought. Sometimes the auger meets with great trees, which give the workmen inuch trouble; they alio fometimes fee at the bottom of thefe wells great bones, coals, flints, and pieces of iron.

It has been afferted by fome, that the fpecific gravity of the ftrata conftantly increafed with the depth from the furface. But Dr Lcigh, in his Natural Hiflory of Lancafhire, fpeaking of the coal-pits, denies the ftrata to lic according to the laws of gravitation; obferving, that the frata there are firlt a bed of marle, then free-ftone, next iron-ftone, then coal, or channel mire, then fome other ftrata, then coal again, \&c. This determined Mr Derhan to make a nicer inquiry into the matter: accordingly, in 1712 , he caufed divers places to be borcd, laying the feveral ftrata by themfelves ; and afterwards determined very carefully their fpecific gravity. The refult was, that in his yard the ftrata were gradually fpecifically heavier and heavier the lower and lower they went; but in another place in his fields, he could not perceive any difference in the fpecific gravities.

Acquainting the Royal Society therewith, their operator Mr Haukfoee was ordered to try the flrata of a coal pit, which he did to the depth of 30 ftrata : the thicknefs and fpecific gravity of each whereof he gives us in a table, in the Philofophical Tranfactions; and from the whole makes this inference, that it evidently
in a place called Pnys. The two frategi did not conimand together, but took their turns day by day ; as we find from Herodotus and Cornelius Nepos. Some- S times indeed, as when a perfon was found of merit vaftly fuperior, and exceedingly famed in war, the comman? was given to him alone: but it was ever a rule, not to put any perfon in the office but whofe eftate was in Attica, and who had children, that there might be fome holtares and fecurities for his conduet and fidelity. Confantine the Great, befides many other privileges granted to the city of Athens, honoured its
 nus Dux.

STRATH, in the Scottifh languare, fignifies a long narrow valley, with a river running along the bottom.

STRATHEARN, a beautiful and extenfive valley in Perthfhire, bounded on the north by the lo ty rid re of mountains called the Grampians, and on the fouth by the Ochils, which are rounded on the tops and covered with verdure. It is called Strathearn from the river Earn, which runs through the middle of it from welt to eaft for about 30 miles. On each fide of the banks of this beautiful ftream are many villages and country.feats diltinguifhed for romantic fituationts. Were wee to lingle out any of the villages, we would mention Crieff, which ftands on a fine floping ground on the nortl fide of the Earn, and has been much admired by travellers for its fituation, and the variety, contraft, fingularity, and beauty of the profpect which it affords.

STRATHNAVER, a fubdivifon or dittrict of the cqunty of Sutherland in Scotland; bounded on the north by the ocean, on the eaft by Caithnefs, on the fouth by Sutherland properly fo called, and on the weft partly by Rofs and partly by the ocean.

SI'RATIOTES, Water-soldier, in botany: A genus of plants belonging to the clafe of polyandria, and to the order of bexagynia; and in the natural fyftem ranging under the firft order, palma. The fpatha is diphyllous: the perianthium is trifid. There are three petals, and the berry is fix-celled and inferior. There are three fpecies, the aloides, the acoroides, and alifmoides. The aloides alone is of Britifh extraction, which is alfo called the water aloe, or frefb-zuater foldier. The root confifts of long fibres tufted at the ends. The leaves are thick, triang ular, pointed, and prickly at the edgcs. The flowers are white and floating on the water, and bloffom in June. This plant may be feen in now rivers and fens.

STRATO, a philofopher of Lampfacus, difciple and fucceffor in the fchool of Theophraftus, about \(24^{8}\) years before the Chriftian era. He applied himfelf with uncommon induftry to the ftudy of nature; and after the moft mature inveftigations, he fupported that nature was inanimate, and that there was no god but nature. (See Plastic Nature). He was appointed preceptor to Ptolemy Philadelphus, who not only revered his abilities and learning, but alfo rewarded his labours with unbounded liberality. He wrote different treatifes, all now loft.

STRAWBERRY, in botany. See Fracaria,
Stramberry-Tree. See Arbutus.

Strath II Strawberry appears the gravities of the feveral ftrata are in no manner of order, but purely cafual, as if mixed by chance.

STRATAGEM, in the art of war, any device for deceiving and furprifing an enemy. The ancients dealt very much in ftratagems; the moderns wage wan more openly, and on the 〔quare. Frontinus has made a collection of the ancient ftratagems of war.

STRATEGUS, sparn 1 os, in antiquity, an officer among the Athenians, whereof there werc two chofen yearly, to command the troops of the fate.

Plutarch fays, there was one chofen from out of each tribe ; but Pollux feems to fay they were chofen indifferently out of the people. The people themfelves snade the choice; and that on the laft day of the year,

[^0]:    *Man hath no free-will. Man is in fin lo long as he liveth. Children, incontinent after their baptifme, are finners. All Chriftians, that be worthie to be called Chriftians, do know that they are in grace. No man is juftified by works, but by faith only. Good works make not a good man, but a good man doth make good worke. And faith, hope, and charity, are fo knit, that he that hath the one hath the reft ; and he that wanteth the one of them wantetb the reft." Keith, Hiff. of the Church and State of Scotland, Appendix, P. 3.
